Convection is the flow of heat caused by the motion of a liquid or a gas. An example is the heating of water in a teakettle. As water is heated, the molecules that make up the water rise and the heat spreads.

Heat radiation is the flow of heat between objects that are not in contact with each other. An example is the heat felt by someone standing a distance away from a hot stove.

Radiation from the sun gives Earth most of its heat. Energy from the sun's radiation is stored in such fuels as coal, oil, gas, and wood. These fuels can be burned to provide more heat.

Heather

Heather plants grow on a hill in Yorkshire, England.

Scotland is famous for its rolling hills covered with the beautiful purple flowers of the plant called heather. Scotland is not the only place that heather grows, however. Heather grows throughout Great Britain, northwestern Europe, northern Asia, and North America. Heather grows well in poor soil. It needs lots of sunlight to grow.

Heather is an evergreen plant. This means that it does not lose its leaves in autumn. Heather usually does not grow taller than 3 feet (0.9 meter). Its leaves are most often green. But they also may be gray, yellow, gold, orange, or red. Heather has tiny, bell-shaped flowers that are pink, rose, purple, red, or white.

Heather is a useful plant. It can be made into brooms and baskets. Long ago, the people of Scotland made houses of heather mixed with mud and straw. Heather also attracts bees and butterflies.

The scientific name of heather is *Calluna vulgaris*. Heather belongs to a family, or group, of plants called heaths. Other plants in the heath family include the blueberry plant.

Hedgehog

Hedgehogs are small mammals that live in the wild in Europe, Africa, and Asia. They are also kept as pets in some parts of the world. People sometimes call porcupines hedgehogs, but hedgehogs and porcupines are different animals.

Hedgehogs are found in deserts, forests, grasslands, marshes, and gardens. They spend the day sleeping under leaves or in holes. They come out at night to eat insects, slugs, spiders, small reptiles, and fallen fruit.

The hedgehogs called spiny hedgehogs have thousands of sharp spines on their bodies. Spines cover everything except

There are 15 species, or types, of hedgehog. The European hedgehog is sometimes kept as a pet.

the underside, legs, face, and ears. The spines are cream colored with bands of brown and black. When threatened, spiny hedgehogs curl into a ball so that only their spines are showing. The spines keep most animals from harming the hedgehog.

Some spiny hedgehogs hibernate in the winter. Hibernation allows an animal to use less energy when food is hard to find. While hibernating, hedgehogs use the fat built up in their bodies to survive.

Hairy hedgehogs have hair instead of spines. They also have well-developed tails. They look like rats. Their hair color ranges from white to brownish red to black. The hair may be soft or very rough. Hairy hedgehogs can be the size of a mouse, or they can be as long as 18 inches (46 centimeters).

Helena

Population
(2007 estimate)
28,726

Helena is the capital of the U.S. state of Montana. The city is located near the Missouri River and the Rocky Mountains.

The Montana state Capitol, in Helena, was opened for use on July 4, 1902.

Helena is a center for the trade of crops and livestock. Many people there work for the state government. Manufacturing industries and tourism also bring money to the city. The Montana Historical Society is located in Helena. It has a museum, a library, and an art gallery.

The explorers Meriwether Lewis and William Clark passed through the Helena area in 1805. The town was founded after gold was discovered there in 1864. The miners had almost given up their search for gold. Finally they struck gold in a place they called Last Chance Gulch. The town was named for Helena, Minnesota.

Helena became the capital of the Montana Territory in 1875. Montana became a U.S. state in 1889. Helena remained the capital. Earthquakes damaged the city in the 1930s, but the damage was quickly repaired.

Helicopter

A helicopter is a kind of aircraft. Unlike an airplane, a helicopter can fly straight up and down, sideways, or backward. It can also spin around or hover motionless in the air. Helicopters can fly lower than airplanes can, too.

How a Helicopter Flies

Like an airplane, a helicopter flies using wings. A helicopter's wings are thin, narrow blades that rotate, or spin around. The blades on top of a helicopter, along with the parts that connect them, are called the main rotor. The main rotor is connected to an engine. The engine sends power to the main rotor to spin the blades. Most helicopters have just one main rotor, but some have two or more.

As the blades spin, air pushes against them. A helicopter pilot has controls that change the position of the blades. This affects how the air hits them. The pilot also controls how much power the engine sends to the rotor. Using these controls together, the pilot can move the helicopter up, down, forward, backward, or sideways.

A helicopter also has a small set of blades in the back. This is called the tail rotor. To turn the helicopter, the pilot pushes pedals that move the tail rotor. The tail rotor also keeps the helicopter from spinning around.

Uses

Helicopters are useful because they can fly almost anywhere. They are used to

The diagram shows the different parts of a helicopter.

rescue people from disasters such as fires, floods, and earthquakes. Helicopters can quickly carry injured people to a hospital. They can even land on the roofs of some hospitals and other buildings. Armies use helicopters to attack the enemy and to carry soldiers and equipment. Police use helicopters to look for criminals. Farmers use them to spread seeds and fertilizers on their fields.

A helicopter picks up workers from an oil platform in the North Sea.

History

People in China and Europe made toys that worked like helicopters many hundreds of years ago. In the 1400s the Italian artist and engineer Leonardo da Vinci drew an aircraft much like today's helicopters. It was never built. In 1843 the English inventor Sir George Cayley built a helicopter powered by a steam engine. It could barely get off the ground.

By the 1900s more powerful engines were available. Engineers used these engines to improve the helicopter. They also made improvements that helped keep helicopters stable in the air. The first successful helicopters were built in Germany in the 1930s. After that, engineers designed new types of helicopters that were used for all kinds of different purposes.

Helsinki

Population

(2008 estimate), city, 568,531;
(2003 estimate), urban area, 1,075,000

Helsinki is the capital of Finland, a country in northern Europe. It is Finland's largest city. Helsinki is located on land that sticks out into a gulf of the

The Uspenski Cathedral is located in Helsinki. It is the largest Orthodox church in western Europe. It was built in the 1860s, when Russia ruled Finland.

Baltic Sea. The city is surrounded by good natural harbors.

Helsinki is Finland's leading port and center of industry. The city's main industries include shipbuilding and printing. Factories in the city make electronics, clothing, and metal products. Most people in Helsinki work in industries that provide services. Businesses related to computers, telephones, and other kinds of technology are important to the city's economy.

The king of Sweden founded Helsinki in 1550. Finland was part of Sweden for hundreds of years.

In the early 1700s Helsinki suffered from disease, fire, and attacks by Russian forces. Russia invaded the city again in 1808. Helsinki was burned to the ground. Soon all of Finland became part of Russia.

The Russian ruler moved the capital of Finland to Helsinki in 1812. Helsinki grew rapidly as the new capital. The city center was completely rebuilt.

In 1917 Finland declared its independence from Russia. A brief but bloody war followed in Helsinki. Conditions soon became more stable. Helsinki developed into an important center of trade, industry, and culture.

Hemisphere

A hemisphere is half of a sphere, or ball. People use the word to describe one half of Earth. Geographers, or people who study Earth, have divided the planet into two sets of two hemispheres. These are the Northern and Southern hemispheres and the Eastern and Western hemispheres.

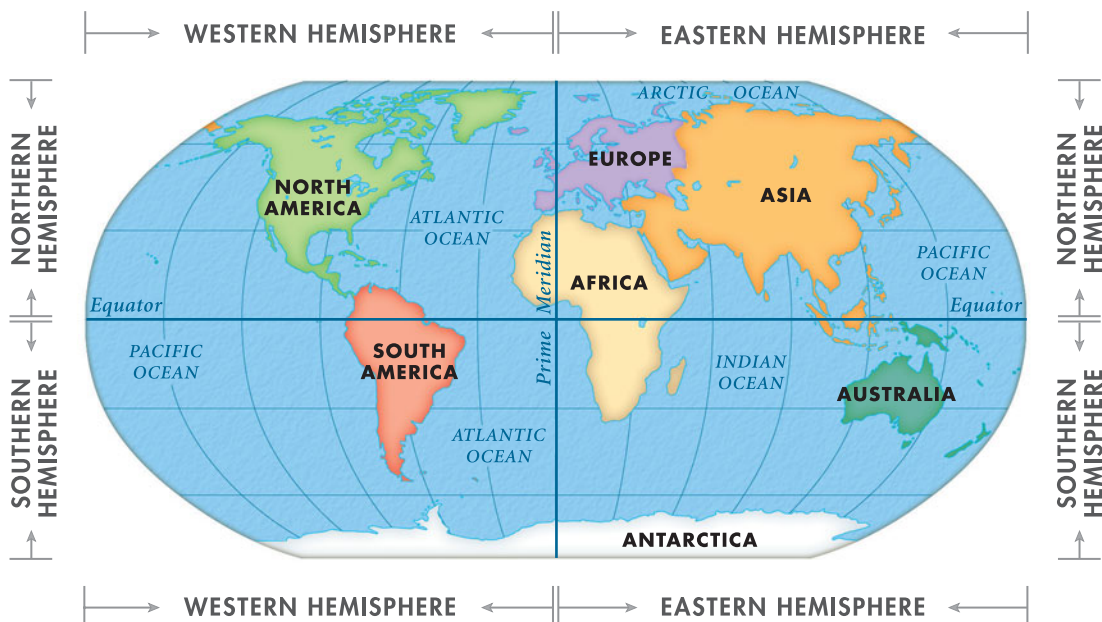

Northern and Southern Hemispheres

An imaginary line called the equator divides the Northern and Southern hemispheres. The equator is also called 0° latitude. It runs east and west around Earth's middle. Places north of the equator are part of the Northern Hemisphere. Places south of the equator are in the Southern Hemisphere.

The Northern Hemisphere includes North America, Central America, Europe, and mainland Asia. About half of Africa and a small part of South America are also in the Northern Hemisphere. The rest of Africa, most of South America, and all of Australia and Antarctica lie in the Southern Hemisphere.

Eastern and Western Hemispheres

Another imaginary line separates Earth into Eastern and Western hemispheres. On one side of Earth, this line is called

Did You Know?

Seawater covers about 80 percent of the Southern Hemisphere. It covers about 60 percent of the Northern Hemisphere.

0° longitude, or the prime meridian. It runs from the North Pole to the South Pole through western Europe, western Africa, and the Atlantic Ocean. On the other side of Earth, the line is called 180° longitude. It runs from the North Pole to the South Pole through the Pacific Ocean.

The Western Hemisphere lies west of 0° longitude and east of 180° longitude. It includes North America and South America. The Eastern Hemisphere lies east of 0° longitude and west of 180° longitude. It includes almost all of Europe and Africa and all of Asia and Australia. About half of Antarctica lies in the Eastern Hemisphere, and about half lies in the Western Hemisphere.

Hemlock

Hemlocks are tall evergreen trees in the pine family. There are about 10 species, or types, of hemlock found in North America and eastern Asia. Hemlocks grow slowly and can live for 800 years or more.

Hemlocks grow best in cool, shaded areas. They grow to an average height of 60 to 70 feet (18 to 21 meters) but can be much taller. They have drooping branches that form the shape of a pyramid. Small cones hang from the branch tips. The cones hold the tree's seeds. The leaves, called needles, are short and flat. Insects eat the needles and can destroy whole forests of hemlocks.

Many hemlock trees grow in cold places. Sometimes frost covers their needles.

The bark of hemlock trees provides tannin. Tannin is used to preserve and dye leather. People also make paper out of hemlock wood.

Some poisonous plants also are called hemlock, but they are not related to hemlock trees. They include poison hemlock and water hemlock. These plants are poisonous herbs of the parsley family. They grow in North America and Europe. Animals and people can die from eating these plants.

Henry VIII

England had eight kings named Henry. The last of them, Henry VIII, is remembered for his six wives and his quarrel with the Roman Catholic church.

A painting from the 1500s shows King Henry VIII of England. A famous artist named Hans Holbein the Younger made the painting.

Henry VIII was born in England on June 28, 1491. He was not yet 18 when he became king in 1509. Later that year he married Catherine of Aragon. Catherine had six children, but only one, named Mary, survived to adulthood.

Henry wanted a boy to inherit the throne. He believed that he needed a new wife to have his son. At the time, Henry and most English people belonged to the Roman Catholic church. However, in 1527 the pope (the leader of the Roman Catholic church) refused to allow Henry to end his marriage to Catherine. Henry therefore cut all ties to the church and placed himself in charge of the new Church of England, or Anglican church. Henry severely punished those who continued to practice the Catholic faith.

The king soon married Anne Boleyn. Her only child was a daughter, Elizabeth. In 1536 he had Anne Boleyn put to death. A few days later he married Jane Seymour. She gave birth to Edward, the son Henry wanted. Then she died.

Henry then married a German princess, Anne of Cleves. He soon divorced her. In 1540 he married Catherine Howard. Henry had her, like Anne Boleyn, put to death. In 1543 Henry took his sixth wife, Catherine Parr, who outlived him.

Henry died on January 28, 1547. During his reign he had united England and Wales. He had also taken control of Ireland. Three of his children—Edward, Mary, and Elizabeth—later became rulers of England.

Henry, Patrick

Patrick Henry was an early American patriot who helped shape the first gov-

Patrick Henry delivers his "give me liberty or give me death" speech in 1775.

ernment of the United States. His powerful speeches about liberty and self-government still inspire people today.

Early Life

Patrick Henry was born in Studley, Virginia, on May 29, 1736. He received very little schooling as he was growing up. Later he studied law. He became a lawyer in 1760.

Career

Henry soon became very successful as a lawyer. He also began speaking out against the British government. He strongly believed that the American colonies should be free of British rule. In a speech in 1775 Henry spoke his most famous words: “give me liberty or give me death.”

Throughout his life Henry had several jobs in government. He began in 1774 as a member of the Continental Congress. The congress was in charge of governing the 13 colonies. He also served several terms as governor of Virginia. He came out of retirement in 1780 to serve in Virginia’s legislature.

After the American Revolution Henry protested against the new U.S. Constitution. He believed that the Constitution did not give enough rights to the states or to individual citizens. Many people agreed with him. Henry’s beliefs helped get 10 amendments, or changes, added to the Constitution in 1791. These amendments are known as the Bill of Rights. The Bill of Rights gives many important freedoms to U.S. citizens.

Henry was elected to the Virginia legislature again in 1799. However, he never started his term. He died of cancer at his home near Brookneal, Virginia, on June 6, 1799.

Patrick Henry helped to write the first constitution of the state of Virginia.

time were made of wood. But Henson searched for material that would be easier to move and could let characters show more personality. He chose foam rubber and plastic covered with fabric.

The Muppets began appearing in brief segments on television programs in the late 1950s and 1960s. They became very popular in 1969 when they became part of the television show *Sesame Street*. They were featured in their own television program, *The Muppet Show*, from 1976 to 1981. They later appeared in *The Muppet Movie* (1979) and other motion pictures. Henson also worked on films that had puppets other than the Muppets. He died in New York City on May 16, 1990.

Henson, Matthew

Matthew Henson may have been the first person to stand at the North Pole. He reached the Pole as a member of an expedition to the Arctic led by the explorer Robert E. Peary in 1909.

Matthew Alexander Henson was born in Maryland on August 8, 1866. When Henson was only about 13 he went to work on a sailing ship. His ship visited ports across the world. In 1887 Henson became an assistant to Peary. Peary was a young naval officer who had already made one trip to the Arctic.

Peary and Henson made seven expeditions to the Arctic. They hoped

When he explored the Arctic, Matthew Henson had to dress warmly.

to be the first people to reach the North Pole. In 1908 they set out on one of their expeditions, though they did not always stay together. On April 6, 1909, Henson arrived alone at what he believed to be the North Pole. When Peary joined him an hour later, he refused to accept Henson's calculation. Peary chose a different spot and declared it the North Pole.

When they returned home Peary received most of the credit for the discovery. This was partly because he was the leader of the expedition. But it was also because Henson was an African American. Racial prejudice at the time kept him from receiving credit for his accomplishments.

Later in Henson's life he gained some recognition for his achievements. Henson died in New York City on March 9,

1955. In 1988 he was reburied in a military ceremony at Arlington National Cemetery. He lies there next to Admiral Robert Peary.

Hepatitis

Hepatitis is a disease that damages the liver. The liver is an organ, or body part, that removes wastes from the blood. Most cases of hepatitis are caused by a particle called a virus. There are seven different hepatitis viruses. To tell them apart, the viruses are labeled with the letters A through G.

The hepatitis A virus causes the most common form of the disease. It is a mild, short-term illness. The hepatitis B, C, and D viruses can cause long-term liver problems. The hepatitis E virus usually causes a serious illness, and it can lead to death.

A photograph shows a magnified image of the hepatitis B virus. Color has been added to the photograph to make the virus easier to see.

Hepatitis A, E, and F are spread through contact with infected food or water. Hepatitis B, C, D, and G are spread through infected blood and other bodily fluids. People who take certain medicines or drink too much alcohol can also get hepatitis.

The symptoms, or signs, of hepatitis include fever, tiredness, loss of appetite, vomiting, and muscle aches. In severe cases the liver damage can lead to a condition called jaundice. Jaundice causes a person's eyes and skin to turn yellow.

A person with a serious case of hepatitis may need to stay in a hospital. If the liver fails, the person may need a liver transplant. In this type of surgery a doctor replaces the damaged liver with a healthy one.

Mythology

Hera

In ancient Greek mythology Hera was the wife of Zeus, the king of the gods. Because of this marriage, she was queen of the gods. Hera was also the goddess of marriage and women's lives. For instance, she was thought to protect women during childbirth. Hera was one of the 12 chief gods believed to live on Mount Olympus. She is associated with the Roman goddess Juno because the two shared many traits. The cow and peacock were sacred to Hera.

Hera was the daughter of Cronus and Rhea, who were Titans. The Titans were giants who once ruled the world. Hera's children with Zeus included Ares and Hephaestus. Ares was the god of war and Hephaestus was the god of fire.

Although the Greeks honored Hera, most stories portray her as jealous and

Heracles

In ancient Greek mythology Heracles was a hero with amazing strength and courage. The ancient Romans called him Hercules.

According to legend, Heracles' father was Zeus, the chief god. His mother was Alcmene. Zeus's wife was Hera. She was jealous of all the women that Zeus loved, including Alcmene. Because of this, Hera hated Heracles.

Hera caused Heracles to become insane for a couple of minutes. During his madness Heracles killed his wife and children. As soon as the madness passed, he was horrified and overcome with grief. He consulted a priestess who was thought to speak for the gods. He asked her how he could make up for his awful deed. She told Heracles to visit King Eurystheus and do whatever he asked. Heracles followed the advice. But the king assigned Heracles 12 tasks that seemed impossible to accomplish.

Heracles was ordered to kill or capture several dangerous monsters. These included a nine-headed serpent and the three-headed dog that guarded the gates of the underworld. Another task was to steal golden apples that were said to make people live forever. He also had to

Heracles was a hero in ancient Greek mythology.

wash horse stables that had not been cleaned in 30 years. In addition, he had to get the belt of Hippolyta. She was the queen of the Amazons, a group of women warriors.

Heracles was not brilliant. But he was determined and strong. He accomplished all 12 labors. He even showed great cleverness at times. For example, to clean the filthy stables, he changed the paths of two rivers. The rivers washed the stables in a single day.

Herb

Herbs are the fragrant leaves or other parts of certain plants. These plants are also known as herbs. Common herbs include mint, basil, oregano, bay, parsley, and thyme. People use herbs, dried or fresh, to add flavor and aroma to foods. Herbs are also used in some cosmetics, teas, and medicines. People sometimes use the word spices to describe dried herbs.

Most herbs grow in mild climates. However, herbs can be planted wherever the growing conditions are good. Many people grow herbs indoors. In general, herbs grow well in dry, well-drained soil. Many require a lot of sun. Natural fertilizers, such as manure or compost, help herbs to form the oils that give them their flavor.

Most herbs come from the leaves of a plant. Bay leaves come from an evergreen tree called the bay laurel. Rosemary and sage are the leaves of bushes. Some herbs come from other parts of a plant. Ginseng comes from the roots of ginseng plants. All parts of the fennel plant can be used as flavoring.

Did You Know?

The banana plant is often called a tree but is actually a giant herb.

Herbs can be grown both indoors and outdoors.

People have used herbs for thousands of years. Early doctors used herbs to treat many illnesses. By the Middle Ages (about AD 500 to 1500), many Europeans were using herbs in their cooking. When the first settlers came from Europe to North America, they brought these herbs with them. Native Americans taught the settlers about the herbs growing in the Americas.

traits. Artists often pictured Hermes wearing a winged hat and winged sandals. These items were symbols of his great speed.

Hermes was the son of Zeus and Maia, a Titan. The Titans were giants who once ruled the world. Hermes had many roles in Greek mythology besides being the messenger god. It was said that Hermes led people down to Hades, or the underworld, after death. He was also considered the god of travelers, business, good luck, and thieves.

Hermes was said to be sly and deceitful. According to one story, when Hermes was only a few hours old, he stole cattle from the god Apollo. Zeus told Hermes to give the cattle back. Instead, Hermes played a stringed instrument called a lyre, which he had invented. Apollo loved his playing so much that he let Hermes keep the cattle in exchange for the lyre.

Heron

Hérons are long-legged birds typically found in ponds, marshes, and swamps. They also live along coasts and freshwater lakes and streams. Herons are wading birds, which means they feed while standing or walking in shallow water. They are found nearly all over the world, especially in warm regions.

There are about 60 species, or types, of heron. Several types of heron are called egrets. Herons are in the same family as bitterns. They are also related to storks, ibises, and flamingos.

A heron is typically a tall bird with broad wings and a long neck. Unlike most other birds, a heron flies with its head held back against its body. Its bill is long, straight, and pointed. Herons often have gray, brown, black, or white feathers. Most egrets are white.

The largest heron is the goliath heron, which is about 59 inches (150 centimeters) long. The great blue heron is slightly smaller. On the other hand, the green heron is only about 20 inches (51 centimeters) long.

Most herons feed during the day. However, the types called night herons are active mainly at night. Most kinds of heron stand still like a statue in the

The great blue heron is one of the best-known types of heron. It has a wingspan of 6 feet (1.8 meters) or more.

Hestia

In ancient Greek mythology Hestia was the goddess of the home. She was also the goddess of architecture. Hestia was one of the 12 main gods believed to live on Mount Olympus. Unlike other Greek gods and goddesses, she was admired more for her virtues than her adventures. She was kind, generous, peaceful, and, above all, welcoming to visitors.

Hestia was the eldest daughter of Cronus and Rhea, who were Titans. The Titans were giants who once ruled the world. When Hestia became a young woman, the gods Apollo and Poseidon both wanted to marry her. Hestia refused their offers and swore to remain unmarried forever. She lived on Mount Olympus and dedicated herself to making others feel welcome and comfortable. She tended the eternal flame that burned on Mount Olympus.

In the center of every ancient Greek home, the hearth (or fireplace) was dedicated to Hestia. Most ancient cities also dedicated hearths to Hestia in town halls. When a family moved to a new home, a woman brought fire from her mother's hearth to light her own. Likewise, new communities brought torches from their former cities to light their

Mythology

Hiawatha

Hiawatha was a legendary Native American leader. He helped five warring Indian nations—the Cayuga, the Mohawk, the Oneida, the Onondaga, and the Seneca—join together in peace. Their alliance was called the Iroquois Confederacy.

Little is known for sure about Hiawatha's life. He probably lived in the late 1500s, but some scholars think that he lived during the 1400s. Hiawatha may have been a member of either the Onondaga or the Mohawk tribe. Both tribes lived in what is now the northeastern United States.

The times were violent and dangerous for Hiawatha's people. Wars with other Native Americans and fighting between families caused much death and suffer-

ing. According to legend, a Huron prophet named Dekanawidah visited Hiawatha and inspired him to work for peace. Hiawatha asked the leaders of the warring nations to form an alliance. They accepted Hiawatha's plan and formed a peaceful union.

Although historians disagree about Hiawatha's exact role in the Iroquois Confederacy, the five nations did join together during the 1400s or 1500s. The strong alliance protected all the nations from attacks by outsiders. The Iroquois Confederacy stayed together until the American Revolution (1775–83) split it apart. Iroquois people today still respect Hiawatha as an important early leader.

Did You Know?

Legend says that Hiawatha was a powerful magician who taught his people how to practice medicine and to write using pictures.

A statue of Hiawatha stands in Ironwood, Michigan.

Hibernation

Hibernation is a way that some animals deal with the harshness of winter. They curl up in a safe place and stay there until winter ends. Hibernating animals seem almost dead. They barely breathe, and their body temperature is near the freezing mark. In warmer weather they return to their regular activities.

Animals that hibernate are called hibernators. They include bats, hedgehogs, ground squirrels, groundhogs, and marmots. Some animals are inactive in the winter but are not true hibernators.

How Animals Hibernate

Hibernators like dark, quiet winter homes. Some go underground or into

A small mammal called a dormouse hibernates in its nest.

caves. They may line their hibernation place with leaves, grass, hair, and other materials.

Hibernators prepare for winter with extra eating. They store fat to keep them alive during the months when they do not eat. The animal's body breaks down the fat when it needs energy. Some hibernators collect and store food before hibernating. At times during hibernation, these animals arise to eat.

A hibernator's body responds to weather conditions. If the weather becomes too cold, the animal needs to move around to raise its body temperatures. An animal that does not do this may die. Warmer temperatures tell an animal to come out of hibernation.

How Hibernation Differs from Sleep

Many animals save energy in the winter by sleeping more, but these animals are not truly hibernating. When an animal just sleeps, its body temperature does not

drop much. In addition, noise can wake a sleeping animal but not a hibernator.

Bears are an example of animals that change their activities in the winter but are not true hibernators. They spend most of the winter asleep, but their body temperature barely drops. A bear will move around if woken up. Also, females give birth and nurse during this time.

Other Forms of Hibernation

Only certain mammals are true hibernators. But other kinds of animals do something similar. Many reptiles and amphibians of mild climates become inactive in winter. Frogs and toads rest in holes or in mud at pond bottoms. Snakes may crowd together in caves. Many insects and spiders are frozen solid during the winter.

Hickory

Hickory is the name of a group of similar trees, all belonging to the walnut family. More than 15 different species, or types, of hickory grow in eastern North America. Three species grow in eastern Asia. Some of the best-known hickories are shagbark, shellbark, mockernut, and pecan.

Most hickories grow to about 100 feet (30 meters) tall. They have a long taproot, or main root that grows downward. Hickories have compound leaves,

Did You Know?

In zoos, many animals that normally hibernate stay active during the winter because of noise and light.

The shagbark hickory grows in the eastern half of the United States. It grows very slowly. It takes 200 to 300 years to grow to 80 to 100 feet (24 to 30 meters) tall.

or leaves made up of several parts called leaflets.

Hickory flowers have no petals. The flowers grow either in spikes or in long, thin clusters called catkins. The fruit has a fleshy husk with a hard pit inside. The pit contains the fruit's seed, which is commonly called a nut.

Many types of animals eat the nuts of hickories. People also eat hickory nuts, especially pecans. People grow pecan trees for their nuts and for their light-colored wood. They use hickory wood for fuel, tools, furniture, and flooring.

Hickory trees have a place in U.S. history. Native Americans ground hickory nuts into flour for making bread. They also used hickory-nut oil for cooking.

Pioneers used the trees' wood to make ax handles, wagon wheels, and axles. They burned hickory in their woodstoves, both for cooking and for keeping warm. They enjoyed the flavor of hickory-smoked meats, just as many people do today.

Hidalgo y Costilla, Miguel

Miguel Hidalgo y Costilla is known as the Father of Mexican Independence. In the early 1800s he led a major uprising against Spain, which then ruled Mexico.

Early Life

Hidalgo was born on May 8, 1753, near Guanajuato, Mexico, northwest of

Miguel Hidalgo y Costilla

Mexico City. He earned a degree in theology, or religion. In 1778 he became a Roman Catholic priest.

Father Hidalgo worked as a priest in the town of Dolores. He worked to improve the lives of the people there. He taught them new farming techniques. He also helped them to start pottery and brick-making businesses.

Fight for Independence

In 1808 France invaded Spain. The French forced the Spanish king to step down. These events encouraged many poor Mexicans to begin fighting for independence from Spain. Spanish soldiers fought back fiercely. They destroyed many Mexican farmlands.

Moved by the problems of his people, Father Hidalgo joined the fight for independence. On September 16, 1810, he rang a church bell and called the people to revolt against Spain. His call became known as the Grito de Dolores (the cry of Dolores). Thousands of Mexicans joined Hidalgo to march against the Spanish.

Hidalgo and his army of rebels won a number of battles. In the end, however, the Spanish defeated them. The Spanish captured Hidalgo on March 21, 1811. On July 31 they put him to death for being a traitor.

Ten years later Mexico finally won its independence from Spain. But Mexicans did not forget that Hidalgo had started it all. Mexico still celebrates its Indepen-

dence Day on September 16—the date of Hidalgo’s cry for freedom.

Mexico

Hidatsa

The Hidatsa are Native Americans of North Dakota. They have lived along the Missouri River for hundreds of years. Early European traders mistakenly thought that the Hidatsa were related to the Gros Ventre people. The traders used the name Gros Ventre for the Hidatsa as well. The Hidatsa are still sometimes called the Gros Ventre of the Missouri.

The Hidatsa traditionally lived in dome-shaped homes called lodges. They built their lodges by covering a wood frame with dirt. The Hidatsa grew corn, squash, and beans. They also hunted bison (buffalo) on horseback.

The Hidatsa wore clothing made from bison skins. The clothing was usually decorated with paint.

Did You Know?

Every Mexican Independence Day, the Mexican president shouts a version of Hidalgo’s Grito from the balcony of the National Palace.

By the late 1700s French and English traders were visiting the Hidatsa. The tribe's villages became a major trading center. The Hidatsa gave the Europeans horses, animal hides, and coats and blankets made from bison skins. In return they received guns, knives, and other goods.

The Europeans also brought diseases such as smallpox and measles. In 1837 smallpox almost wiped out the Hidatsa. The survivors came together to live in a single village. By 1862 the Mandan and the Arikara had joined them.

In 1870 the U.S. government set up the Fort Berthold Reservation in what is now North Dakota. The Hidatsa, the Mandan, and the Arikara lived there together. In 1934 the tribes became known as the Three Affiliated Tribes. At the end of the 20th century there were about 600 Hidatsa living in the United States.

Hieroglyphics

Hieroglyphics is a writing system that uses pictures and symbols instead of letters and words. It is most often associated with the ancient Egyptians. However, other groups, including the Maya, used similar writing systems.

Each symbol in hieroglyphic writing is called a hieroglyph. The word hieroglyph means “holy carving.” The Egyp-

Hieroglyphs often decorated the tombs of important ancient Egyptians. Queen Nefer-tari's tomb has hieroglyphs and a picture of her playing chess.

tians used hieroglyphs on their temple walls and public monuments. They carved them in stone but also painted them on wood and other smooth surfaces.

Hieroglyphs were used in several ways. Some represented the objects that they depict. For example, the word sun would be represented by a large circle with a smaller circle in its center. Other hieroglyphs represented ideas that were associated with the picture. The sign for “sun” might serve as the sign for “day.” Hieroglyphs could also stand for particular sounds or groups of sounds.

Hieroglyphics developed thousands of years ago. By 2900 BC, the Egyptians were using hieroglyphic writing. It remained in use for more than 3,000 years. During the AD 100s and 200s,

many Egyptians became Christians. Egyptian Christians used the Greek alphabet. Slowly, people stopped using hieroglyphics. Eventually, no one could read hieroglyphic writing anymore.

In 1822 a French scholar rediscovered the meaning of hieroglyphics. He did it by studying the Rosetta Stone. Soldiers had found the stone in 1799. The message on it was written in both hieroglyphics and Greek. The scholar could read Greek, so he could figure out what the hieroglyphs on the stone meant.

Hillary, Edmund

Edmund Hillary was a famous mountain climber and explorer. He and Tenz-

Edmund Hillary stands in front of an airplane that he used to explore Antarctica.

ing Norgay of Nepal were the first people to reach the top of Mount Everest, the highest mountain on Earth. They made their climb in 1953. Hillary later explored Antarctica.

Edmund Percival Hillary was born in Auckland, New Zealand, on July 20, 1919. He became interested in mountain climbing while in his teens.

In 1953 Hillary joined a group of climbers who planned to reach Everest's peak. The group left Kathmandu, Nepal, on March 10, 1953. On May 29, Hillary and Tenzing reached the peak.

Hillary stayed active after his historic climb. In 1958 he led the first trip since 1912 to reach the South Pole by land. In 1967 he was among the first people to climb Antarctica's Mount Herschel. In 1977 he traveled by boat up the Ganges River of India.

Hillary wrote many books about his adventures. He returned to Nepal several times but never climbed to the top of Everest again. He helped build schools, air strips, and health clinics for the Sherpa people of Nepal. He died on January 11, 2008, in Auckland.

Himalayas

The highest mountains on Earth are found in the Himalayas. This great mountain system of southern Asia stretches for about 1,550 miles (2,500

kilometers) from west to east. Most of the Himalayas lie within India, Nepal, and Bhutan. In the Sanskrit language of India, the name Himalayas means “abode of snow.” It refers to the vast, year-round snowfields on the lofty peaks.

Geography

No other mountain range on Earth compares to the Himalayas. Nine of Earth’s 10 highest peaks are Himalayan; the other, K2, is in the nearby Karakoram Range. The peak of Mount Everest, at 29,035 feet (8,850 meters) above sea level, is the highest point on Earth. It lies on the border between Nepal and Tibet. Nineteen major rivers, including the Indus, Ganges, and Brahmaputra, begin in the Himalayas.

People

Few people live in the highest parts of the Himalayas, where the climate is very harsh. More people live on the lower slopes and in the valleys. The people are a mix of ethnic groups. The Sherpa, who live to the south of Mount Everest, are famous as guides for mountain climbers.

Economy

Most of the people of the Himalayas support themselves by growing crops and raising animals. Rice, corn, wheat, millet, and sugarcane are among the major crops. Fruit orchards in some valleys produce apples, peaches, pears, and cherries. The Darjeeling district of northern India is famous for its tea.

History

Mountain climbers first turned their attention to the Himalayas in the 1880s. In the 1900s mountaineers climbed the highest Himalayan peaks for the first time. The New Zealander Edmund Hillary and the Sherpa Tenzing Norgay reached the summit of Mount Everest in 1953. The Himalayas challenge an increasing number of trekkers and climbers every year.

Everest, Mount

Hinduism

Hinduism is the world’s oldest major religion. Some traditions of Hinduism date back more than 3,000 years. Over the centuries, however, its followers—called Hindus—have accepted many new ideas and combined them with the old ones. More than 800 million people practice Hinduism worldwide. Most of them live in India, where Hinduism began.

Beliefs

Hinduism has neither a founder nor a central organization. No one has set

Did You Know?

In Hinduism the law of karma says that a person’s actions in the present life will affect the quality of the next life.

Some Important Hindu Holidays		
Holiday	Meaning	Date
Diwali	festival of lights; honors Laksmi, the goddess of wealth	October/November
Vasantpanchami	honors Sarasvati, the goddess of learning	February
Holi	festival of colors; celebrates spring	February/March
Dussehra	celebrates the triumph of the hero Rama over the evil Ravana	September/October
Note: Actual dates depend on the Hindu lunar (moon) calendar.		

down a list of beliefs for all Hindus to follow. But all Hindus revere the Veda, an ancient body of sacred writings.

Hindus believe in a spiritual power called Brahman. Brahman is the source of all existence and is present in every thing and every place. The human soul, called atman, is part of the universal Brahman. Hindus generally believe that when someone dies, the atman is reborn in another body. A soul may return many times in human, animal, or even plant form. This idea is known as reincarnation. The cycle of rebirth continues until one accepts that the atman and Brahman are one. Most Hindus consider breaking free from this cycle to be a person’s highest purpose.

Hindus are expected to act according to the principle of ahimsa, which means “nonviolence.” This means that one must never wish to harm anyone or anything. Hindus consider many animals to be sacred, especially the cow. Devout Hindus eat only vegetarian food.

Hindus worship many gods. The god Vishnu is considered the protector and preserver of life. The god Siva represents the forces that create life as well as those that destroy it. The supreme goddess is

most commonly called Shakti. Like Siva, she can be either beneficial or fierce, depending on her form. The worship of Vishnu, Siva, and Shakti are the three major branches of modern Hinduism.

Brahma (not to be confused with Brahman) is considered the creator of the universe. In ancient times he was widely worshipped, but his following is now small.

Practices

In a form of worship called puja, Hindus pray for a god to enter a home or

A shrine in a Hindu temple honors Durga, one of the many forms of the goddess Shakti.

temple and then treat the god as an honored guest. They worship an image of the god and offer up food, water, and other items.

Tantrism is the search for spiritual knowledge and for release from the cycle of rebirth. It involves chanting sacred sounds and words called mantras and drawing symbols called mandalas.

Pilgrimages, or journeys to holy places, have been common in Hinduism since ancient times. Many pilgrimage sites lie along the Ganges River in northern India, which Hindus consider the holiest of rivers.

History

In about 1500 BC people called Aryans invaded India from what is now Iran. The Aryans composed the oldest writings in the Veda. They developed a religion, called Vedism, that centered on making animal sacrifices to the gods. Vedism was the starting point of Hinduism. But the influence of other peoples and ideas over the years made Hinduism a very different religion from Vedism. Over time, for example, people began to disapprove of the killing of animals as sacrifices. From the 100s BC to the AD 300s, the older gods of Vedism were slowly replaced by newer ones. But some rites of Vedism have survived in modern Hinduism.

In the 1000s Muslims invaded northern India and Islam influenced some new schools of Hinduism. In the late 1400s a new religion, Sikhism, combined Hindu and Islamic elements.

Hindu children in Kolkata, India, participate in the colorful festival of Holi. Holi is a celebration of spring.

In the early 1800s Great Britain began making India into a colony. In reaction to foreign rule, Hinduism underwent a revival. It helped unify Indians against the British. Also during this period, however, some Hindu leaders began criticizing elements of traditional Hinduism. The reformer Ram Mohun Roy, for example, spoke out against the ancient form of social organization called the caste system. Under this system, people were treated differently depending on which social class they were born into. The reformers used some Western ideas to make Hinduism more modern.

The most famous Hindu leader of the 1900s was Mahatma Gandhi. He brought the idea of ahimsa into politics. He helped win India's independence from Britain using only nonviolent methods.

Differences between Hindus and Muslims grew after the colony of British India was divided into the independent

countries of India and Pakistan in 1947. Millions of Hindus left their homes in Pakistan for India, and millions of Muslims left India for Pakistan. Many Hindus and Muslims were killed. In India and elsewhere, violence between Hindus and Muslims continued into the 21st century.

Hinton, S.E.

S.E. Hinton is an author of popular fiction for young adults. Her realistic way of describing teenage life has brought her fans worldwide. Hinton has also published books for younger children and adults.

Hinton's full name is Susan Eloise Hinton. She was born in Tulsa, Oklahoma,

S.E. Hinton

on July 22, 1950. As a child she loved reading, especially animal stories. At age 16 Hinton wrote *The Outsiders*, the story of two rival high school groups. A friend's mother helped Hinton publish the book. It remains Hinton's most famous and best-loved novel.

Hinton later wrote more novels for teenagers. They included *That Was Then, This Is Now*; *Rumble Fish*; *Tex*; and *Tamming the Star Runner*. Like *The Outsiders*, these novels deal with teenagers in tough situations. Hinton's first four novels were later made into movies.

In the 1990s Hinton wrote *Big David*, *Little David* and *The Puppy Sister* for younger readers. She published *Hawkes Harbor*, a novel for adults, in 2004.

Fiction

Hip-Hop

Hip-hop is a type of music. It is also a culture, or way of life. It includes many types of expression—for example, rapping, deejaying, dancing, and graffiti painting. Fans of hip-hop culture also wear certain styles of clothing.

Hip-hop music often has heavy beats and electronic sounds. It may also include other musical styles, such as jazz or rock and roll. Rap is usually set to hip-hop music. Rap is speech that has a rhythm and rhymes.

Another part of hip-hop music is deejaying. Deejays change the sound of

Hip-hop artist Kanye West performs in Los Angeles, California.

recorded music in various ways. They may mix songs together or speed up or slow down a song's beat.

New styles of dancing developed along with hip-hop music. Break dancing was one of the earliest styles. Break dancing is acrobatic. It includes such moves as spinning on the back and springing from the ground on the arms.

Many young people copy the clothing styles of hip-hop stars. Some popular hip-hop styles have been oversized T-shirts, baggy pants, gym shoes, and large jewelry.

The hip-hop movement began in poor, mostly African American, parts of New York City in the 1970s. Young African Americans gathered at parties, where they developed rapping, deejaying, and break dancing.

The first rap song to become a national hit was "Rapper's Delight" by the Sugarhill Gang. It came out in 1979. The song helped to spread hip-hop culture throughout the United States and the

rest of the world. Later hip-hop artists included Run-D.M.C., LL Cool J, De La Soul, Queen Latifah, Ice Cube, Snoop Dogg, the Beastie Boys, Missy Elliott, Kanye West, and Sean Combs (known as P. Diddy, or Diddy).

Hippopotamus

The hippopotamus is a huge mammal that lives in eastern Africa. It spends most of its time in rivers, lakes, and swamps. The hippopotamus is related to pigs. Its scientific name is *Hippopotamus amphibius*.

Hippopotamuses have a barrel-shaped body. They are about 11.5 feet (3.5 meters) long and weigh more than 7,000 pounds (3,200 kilograms). Their hide is very thick. It is grayish brown and almost hairless. Their skin releases an oily substance that looks red in sunlight. Scientists think that this substance acts as sunscreen.

Hippopotamuses live in and around water. The name hippopotamus is Greek for "river horse."

Did You Know?

Because of the oily red substance on a hippopotamus's skin, people used to think that the animal sweated blood.

Hippopotamuses spend the day resting in shallow water. They often sleep with just their eyes, ears, and nose above the water. A hippopotamus can also dive down and walk on lake and river bottoms. It can keep its head underwater for 5 to 10 minutes before coming up to breathe. At night hippopotamuses go onto land to eat grasses.

The pygmy hippopotamus is a close relative. It is very rare. It lives only in a small part of western Africa. Pygmy hippopotamuses are much smaller than other hippopotamuses. The largest weigh about 590 pounds (270 kilograms). They spend less time in the water than the larger hippopotamuses.

Hiroshima

The city of Hiroshima is a port on the island of Honshu in Japan. It was the first city ever to be struck by an atomic bomb.

Hiroshima was founded as a castle town in the 1500s. Beginning in the 1860s it was a military center. On August 6, 1945, in the last days of World War II, the United States dropped the atomic bomb. Much of Hiroshima was destroyed. More than 70,000 people died right away. Radiation left by the bomb killed many more people later on.

Hiroshima was rebuilt after the bombing. It is now a large industrial city. Factories in the city produce steel,

People leave artwork and origami (folded paper) objects at the Peace Memorial Park in Hiroshima, Japan. Origami in the shape of a crane is a symbol of peace.

automobiles, rubber, chemicals, ships, and machinery.

The place in Hiroshima where the bomb exploded is now a park called Peace Memorial Park. It has a museum and monuments to the dead. The Atomic Bomb Dome is the ruins of one building that was left partially standing after the blast.

Hispanic Americans

Hispanic Americans are people living in the United States who are descendants of Spanish-speaking peoples. Most Hispanics are from (or have ancestors from) Latin America. For this reason, they are often known as Latinos. Latin America includes Mexico, Puerto Rico, Cuba, and the countries of South and Central

America. In addition, some Hispanics have ancestors who are African, American Indian, or European.

Hispanics are the largest and fastest-growing minority group in the United States. But Hispanics do not always think of themselves as a single group. Instead, many Hispanics identify with the country or area that they or their ancestors are from. Today more than half of all Hispanics are Mexican Americans. People with roots in Puerto Rico, Cuba, El Salvador, or the Dominican Republic make up the next largest groups of Hispanics.

Coming to the United States

Hispanics have moved to the United States for different reasons. Some have come to escape poverty and find better job opportunities. Others have fled political problems and wars in their home countries. In the case of many

Alberto R. Gonzales, a Mexican American lawyer, became the U.S. attorney general in 2005. The attorney general is the head of the Department of Justice.

A *quinceañera* is a Mexican American celebration of the 15th birthday of a girl.

Mexican Americans, their ancestors were already living in the Southwest before it became part of the United States.

Mexican Americans

In the 1500s Spain conquered what is now Mexico and made it a Spanish colony. Spain also conquered what is now the southwestern United States. The Spanish ruled this territory as a part of Mexico. After the Mexican War of 1846–48, the territory became a part of the United States. Many of the people there spoke Spanish. Their descendants are Mexican Americans. So are the many Mexicans who have immigrated, or moved, to the United States since then.

Puerto Ricans

The United States took over the island of Puerto Rico after the Spanish-American War of 1898. In 1917 Puerto Ricans became U.S. citizens. By 1940 there were nearly 70,000 Puerto Ricans

living in the mainland United States. Puerto Ricans can move freely between the mainland and the island. However, the U.S. Census Bureau counts only those Puerto Ricans living on the mainland as Hispanic Americans.

Cubans

English and Spanish signs mark a street corner in the Cuban American section of Miami, Florida. The neighborhood is called Little Havana because Cuba's capital is Havana.

Large numbers of Cubans moved to the United States after a new leader named Fidel Castro took power in 1959. Many of these immigrants were middle-class shop owners, businesspeople, and professionals. They were afraid that Castro would change their way of life. The U.S. government treated these immigrants as refugees, or people seeking protection from their home country's government. After the 1950s Cubans continued to move to the United States.

Central Americans

From the 1970s to the 1990s a new wave of immigrants came to the United States from Central America. These immigrants were from countries that were involved in civil wars, such as Nicaragua, El Salvador, and Guatemala. Hundreds of thousands of people moved to the United States (and other nearby countries) to escape violence at home.

Important Issues

Migrant Workers

Migrant farmworkers are people who move from place to place to harvest crops. Migrant workers first came from Mexico to work in U.S. cotton fields after the American Civil War (1861–65). Hispanic migrant workers soon became an important part of U.S. farming. However, they usually received low pay and suffered harsh working conditions.

In the 1960s a former migrant worker named Cesar Chavez helped migrant workers to form groups called labor unions. He organized a five-year strike by migrant grape pickers in California. This meant that the grape pickers refused to work until they got better treatment. Chavez also convinced many Americans to stop buying California grapes.

Chavez helped to improve the lives of many Hispanic migrant workers. However, migrant workers today still earn less than other U.S. workers.

Illegal Immigration

Most people who have immigrated to the United States have done so legally. However, more people want to move to the United States than U.S. laws allow. Therefore, some people enter the country without permission. These people are called illegal immigrants or illegal aliens. In the early 21st century there were probably more than 10 million such people in the United States. More than half were from Mexico. About one quarter were from other Latin American countries.

Americans disagree about whether this illegal immigration is helpful or harmful to the United States. Some believe that illegal immigrants help the economy. They do this by taking low-paying jobs that other Americans do not want. Others think it is unfair that the states must pay for public services for people who immigrated illegally. For example, states must pay for the education of children of illegal immigrants.

Bilingualism

Many Hispanic Americans can speak both Spanish and English. This ability is called bilingualism. But many new immigrants—and their children—speak only Spanish at first. Some Americans think that schools should teach Spanish-speaking children in Spanish until they learn English. Other Americans, however, think that schools should teach Spanish-speaking children in English, along with the English-speaking children.

Hispanic Americans Today

By 2004 there were more than 41 million Hispanic Americans in the United States. They made up about 14 percent of the U.S. population.

Many Hispanics are proud of their roots. They want to pass their culture and the Spanish language on to their children. At the same time, Hispanics are an important part of U.S. society as a whole. In 2009 Sonia Sotomayor became the first Hispanic justice of the United States Supreme Court.

History

History is the study of the past. The study of history helps make sense of humankind. It also helps people understand the things that happen today and that may happen in the future.

People trained in history are called historians. Historians usually choose a particular time period or a particular group of people to study. They may write books and articles to help other people understand the past. They often use written records such as diaries, letters, and newspaper articles to learn about the past.

Today records are easy to get. They are mostly written on paper or stored on

Did You Know?

Many people believe that studying history is a way to avoid repeating past mistakes.

An English scholar named Bede was an early historian. In the 700s he wrote a history of the English people up to that time. His book is now part of history itself. A page from the work shows what books were like at that time.

computers. But records from long ago may have been written on stone or drawn on buildings. These records may be buried in the ground, partially destroyed, or covered in layers of paint. Historians who study ancient time periods must uncover these records.

Historians may also use the tools of archaeology to study ancient times. Archaeology is the study of the things that ancient people made, used, and left behind. Some people a long time ago did not have a way to write things down. But historians and archaeologists still learn much about the way these ancient people lived. They do this by studying the tools, homes, clothing,

weapons, and other objects that the ancient peoples used or owned.

Hitler, Adolf

Adolf Hitler ruled Germany from 1933 to 1945. He called himself Führer (Leader). Hitler believed that Germans were born to rule over other peoples. This led to World War II. He also believed that there was no place in society for Jewish people. This idea led to the Holocaust, when millions of Jews were killed.

Early Life

Adolf Hitler was born into a German family on April 20, 1889, in Braunau am Inn, Austria. He grew up in Linz, Austria. In about 1913 Hitler moved to Munich, Germany. When World War I began in 1914, he joined the German army.

Adolf Hitler

After the war Hitler joined a tiny political group in Munich. In 1921 Hitler took control of the group. By then it was known as the Nazi Party. In the 1920s he published his autobiography, *Mein Kampf*, meaning “My Struggle.”

The Third Reich

By 1932 the Nazi Party was the largest party in the Reichstag (Germany’s law-making assembly). Hitler became chancellor, or leader, of Germany in 1933. In 1934 he took complete control. He created what he called the Third Reich, or empire.

Hitler soon put his beliefs into practice. Soon Jews were not allowed to own businesses or attend certain schools. Many were arrested and sent to concentration camps. Hitler also strengthened Germany’s military power.

World War II and the Holocaust

Hitler then moved to enlarge the Third Reich. He took over neighboring countries. When Germany invaded Poland in September 1939, World War II began.

During the war Hitler stepped up his campaign against the Jews. The Nazis killed many in the concentration camps. Others died while working as slave laborers. Eventually some 6 million Jews died in the Holocaust.

By 1944 the war was going badly for Hitler. Hitler killed himself on April 30, 1945, in Berlin, Germany. Germany

surrendered, and the war in Europe ended on May 8.

Hobby

Stamp collecting is a popular hobby. Philately is another word for stamp collecting.

A hobby is a fun activity based on a person’s interests. Many people practice hobbies during their time off from work or studying. Popular hobbies include drawing, collecting baseball cards, and building Web sites. A person with a hobby is called a hobbyist.

Types of Hobbies

Most hobbies involve collecting, creating, observing nature, or using special equipment. Many people collect stamps, coins, seashells, jewelry, or even action figures. Creative hobbyists enjoy arts

Did You Know?

Hobbies can lead to careers. A child who likes to collect rocks could one day become a geologist.

and crafts—for example, painting, singing, writing, carving, sewing, or building models. Hobbies for people who enjoy nature include bird-watching and gardening. Photography, ham radio (amateur radio), and computer programming are hobbies that require equipment. Many hobbies are done alone, but people often form groups or read magazines based on their hobby. No matter what the hobby, there is always an opportunity to learn from it.

History

Before the 1900s most people spent nearly all their time working and caring for their families. Only wealthy people could afford to have hobbies. After the Industrial Revolution, modern technology and machines gave people more spare time, so more people developed hobbies. In the late 20th century computers created a whole new class of hobbies. Many people today spend their spare time surfing the Internet and playing video games.

Ho Chi Minh

Indochina, which was a colony of France. As a young man, Ho worked as a seaman and traveled widely.

Career

While living in Paris, France, Ho became a Communist. Communism is a political system in which the common workers are important.

In 1930 he helped organize a Communist party in Vietnam. The French government did not want him in Vietnam, so he lived in other countries. In about 1940 he began to use the name Ho Chi Minh, which means “he who enlightens.”

In 1945, during World War II, the Japanese took Vietnam from the French. Then the United States defeated Japan. Ho declared Vietnamese independence on September 2, 1945. However, the

Did You Know?

While he lived in France, Ho Chi Minh was known as Nguyen Ai Quoc (“Nguyen the Patriot”).

Ho Chi Minh

Ho Chi Minh was a powerful leader of Vietnam during a troubled period of that country’s history. Ho fought to make Vietnam a united, independent, and Communist country. After his death this dream came true.

Early Life

Ho Chi Minh was born on May 19, 1890, in Hoang Tru, Vietnam. His original name was Nguyen Sinh Cung. Vietnam was then part of French

French soon took back control of southern Vietnam. Ho's forces finally defeated the French in 1954. But Vietnam was then divided into two countries, North Vietnam and South Vietnam.

Ho was president of North Vietnam. An anti-Communist was president of South Vietnam. Ho wanted to reunite the two halves of Vietnam. Starting in about 1959, he supported a Communist rebellion in South Vietnam. The South Vietnamese fought back. This fighting became known as the Vietnam War.

Death and Legacy

Ho Chi Minh died on September 2, 1969, while the Vietnam War was still being fought. The Communists won control of all of Vietnam in 1975. They then changed the name of South Vietnam's capital city from Saigon to Ho Chi Minh City.

Hockey, Ice

Ice hockey is a fast-moving team sport. It is usually played on an ice surface called a rink. Hockey players wear ice skates and move with great speed and skill across the ice. Two teams of six players compete to score the most points, or goals. A team scores when it moves the puck—a small, hard rubber disk—into the opponent's goal. Hockey is a rough sport, with a great deal of body contact between the players.

Playing Area and Equipment

A hockey rink is a rectangle with rounded corners. In international hockey the rink is 200 feet (61 meters) long and 98.4 feet (30 meters) wide. Professional hockey in North America is played on a narrower rink.

Several boundary lines run across the width of the rink. Two blue lines divide the rink into three zones. Between the

Children who live in cold climates often learn to play ice hockey.

The rinks for international hockey and the National Hockey League (NHL) are similar. However, an NHL rink is narrower than an international rink.

two blue lines, at the middle of the rink, is a red center line. At each end of the rink is a red goal line with a goal cage in the middle. The cage is 4 feet (1.2 meters) high and 6 feet (1.8 meters) wide. A net encloses the sides and back. The ice surface also includes markings for face-offs. A face-off is used to start or restart play after it has been stopped.

The hockey stick is the players' main tool. Hockey sticks are made from a variety of materials, such as wood or aluminum. A hockey stick is a long shaft with a flat-faced surface, called a blade, at one end. Players use the blade to hit the puck. The puck is 3 inches (7.6 centimeters) across and 1 inch (2.5 centimeters) thick.

Hockey players wear helmets and heavy padding to protect their bodies. The goalkeepers, or goalies, wear extra pads and gloves. They also wear special masks over their faces. The skates that players wear are specially designed for hockey.

Playing the Game

A hockey game is divided into three periods that are 20 minutes each. The game starts with a face-off in the center of the rink. During the face-off an official drops the puck between two opposing players. The players then use their sticks to try to get control of the puck for their team.

The team that gets the puck starts an offensive attack. The players may handle the puck only with their sticks. They can move the puck themselves or pass it to teammates. They try to get the puck to a player who has a good shot at the opponent's goal. Hitting the puck into the goal scores one point.

There are limits on how a team may send the puck down the ice. For example, a player may not cross the blue line near the opponent's goal until after the puck crosses the line. If this happens, the officials stop play. The game starts again with a face-off.

The team that does not have the puck tries to get it. Its players poke their stick at the puck. They try to steal passes and to block shots. Players often take the puck away from an opponent by using a hit to the body, called a check. But some kinds of body contact are against the rules. For example, a player cannot check another player from behind. This is called a penalty. Players who commit penalties sit in a penalty box, usually for 2 minutes. During this time their team plays one player short.

The players on a hockey team have different positions, or roles. In general, a team has a goalkeeper (usually called a goalie), two defensive players, and three forwards. The goalie tries to keep the puck out of his team's goal. The main job of the defensive players is to assist the goalie. The forwards mostly try to score goals.

History

Ice hockey developed in Canada from games played with sticks and a ball. The first use of a puck was recorded in 1860. In 1875 students at McGill University in Montreal, Quebec, played the first known indoor ice hockey game.

The International Ice Hockey Federation was started in Europe in 1908. Ice hockey became an event in the Olympic Games in 1920. Women's ice hockey was added to the Olympics in 1998.

In North America the National Hockey League (NHL) was created in 1917. The NHL has professional teams from Canada and the United States. At the

end of each NHL season, the league's best team is awarded the Stanley Cup.

Hohokam Culture

The Hohokam culture was one of the first great Native American civilizations in what is now the United States. The Hohokam people lived in what is now Arizona from about 300 BC to about AD 1400.

The Hohokam got most of their food from farming. They grew corn, beans, pumpkins, and squash. They also grew cotton, which they wove into cloth. The soil where they lived was dry and sandy.

Rock carvings on a cliff in Phoenix, Arizona, show two people hunting animals. The Hohokam people carved these designs into the rocks hundreds of years ago.

Did You Know?

Snaketown has ruins of large ball courts. The Hohokam played a game similar to soccer using small rubber balls.

They built wide canals from the Gila and Salt rivers to their fields so they would have enough water for farming.

The largest Hohokam settlement is now known as Snaketown. It is located near Phoenix, Arizona. Early Hohokam lived in pit houses. They made these houses by digging a shallow pit and covering it with a dome of wood and mud. By about 1100 the neighboring Anasazi had taught the Hohokam how to build homes from bricks made of adobe (sun-baked clay).

During the early 1400s the Hohokam abandoned their villages. No one knows why they left or where they went. The people of two modern tribes—the Pima and the Tohono O’odham—are probably their descendants. The name Hohokam means “those who have gone” in the Pima language.

Holly

Hollies are shrubs and trees with green leaves and usually red berries. They are

American holly has prickly leaves and usually red fruits.

popular around Christmastime in Europe and North America. Hollies are often used to make wreaths. There are about 400 species, or kinds, of holly. Many of them are evergreens. Evergreens keep their green color throughout the year.

Hollies grow in the mild and tropical regions of North America, South America, and Asia. Different types of hollies vary in height and appearance. Some may grow to be about 50 feet (15 meters) tall. Others are dense shrubs that are no more than 20 feet (6 meters) in height.

Hollies generally have single leaves that grow on both sides of the branches. The small, greenish flowers develop into clusters of red, yellow, or black berries. The berries remain on the plant through most of the winter. Holly plants are either male or female. Usually only females produce berries.

People have used holly in celebrations, decorations, and religious ceremonies for hundreds of years. Today holly is used mostly for decoration. The leaves of one type, however, are used to make a tealike beverage called maté. In addition, the pale wood of some hollies is used to make furniture.

Holocaust

In 1933 the Nazi Party took control of the country of Germany. The Nazis hated Jewish people and tried to make life hard for them. Later, during World War II (1939–45), they decided to kill as many Jews as possible. Their program became known as the Holocaust. It took the lives of about 6 million Jewish men, women, and children.

Jewish people were not the only ones who died in the Holocaust. The Nazis also killed Roma (Gypsies), homosexuals, mentally and physically disabled people, and anyone who dared to speak out against them.

Anti-Semitism

Adolf Hitler was the head of the Nazi Party. He ordered acts of anti-Semitism (acts against Jews) as soon as he took power in 1933. Many Jews lost their jobs. In 1935 Jews lost their German citizenship.

On November 9–10, 1938, crowds burned synagogues (Jewish houses of worship) all over Germany. They also broke windows of shops owned by Jews. Instead of arresting the attackers, the

Nazis required Jews to wear identifying badges in World War II.

Nazis arrested thousands of Jews. They sent the Jews to concentration camps (large prison centers). The event was called Kristallnacht, or Night of Broken Glass.

By the time World War II began in 1939, Jews could not attend school or own businesses. In many areas, the Nazis made all Jews wear badges so they would not blend in with non-Jews. In some cities, the Nazis forced Jews to live in overcrowded areas called ghettos.

By late 1941, German victories in World War II put most European Jews under Nazi control. During this time the Nazis began to kill large numbers of Jews and other victims. Special units of soldiers rounded up Jews, shot them, and dumped the bodies in mass graves.

Opposition

Many Jews tried to get away from Germany even before the killings began. The family of the young diary writer Anne Frank moved to The Netherlands.

The Franks hid there for two years before the Nazis caught them. Other Jews escaped to the United States, Palestine (now Israel), and other countries.

Some people helped Jews to hide or to escape. Raoul Wallenberg, a Swedish man, saved 100,000 Jews in Hungary. Oskar Schindler, a German, protected 1,200 Jews who worked for him.

Final Solution

In 1942 the Nazis planned a “final solution” to what they called “the Jewish question.” They decided to kill all Jews in all areas controlled by Germany.

The Nazis built special death camps in Poland. Some of their names were Auschwitz, Majdanek, Treblinka, Chelmno, Sobibor, and Belzec. At the camps, the Nazis killed people with poison gas. They then burned the bodies. The Nazis kept some people alive to work as slaves. Many of these prisoners died of starvation or disease.

Visitors look out from the steps of a sculptural memorial at the Majdanek concentration camp in Poland.

Aftermath

The Holocaust came to an end when the Allies—the United States, France, Great Britain, and the Soviet Union—defeated Germany in 1945. Allied soldiers discovered the death camps and released the remaining prisoners.

The Allies also set up a court to try Nazi leaders for their crimes. The biggest trial took place in 1945–46 in Nuremberg, Germany. After this trial, seven Nazi leaders went to jail, and 10 were hanged.

Today many countries have Holocaust Remembrance days to remember the victims. Museums like the Holocaust Memorial Museum in Washington, D.C., educate people about what happened. Many people hope that learning about the Holocaust can prevent such a terrible thing from happening again.

Hologram

A hologram is like a three-dimensional photograph. Photographs show only height and width. Holograms show height, width, and depth. By moving from side to side, a viewer can see the front and the sides of an object shown in a hologram. The process of making holograms is called holography.

A typical hologram is created with a laser. A special mirror splits light from a laser into two beams. One beam shines

Holography uses no camera. Instead, two beams of light from a single laser shine on a piece of film. One of the beams reflects from the object.

directly onto a piece of photographic film. The other shines on the object and reflects onto the film. The two overlapping beams create a pattern of closely spaced lines. The pattern recorded on the film is the hologram.

Some types of hologram have to be viewed with light from a laser. Other holograms can be viewed with ordinary light.

Holograms have many uses. People can make holograms of things that are hard to see normally—for example, parts inside the human body. Then they can

study the details recorded in the hologram. Small holograms are commonly found on credit cards, driver's licenses, and paper money. The holograms make it difficult to produce illegal copies.

Holy Roman Empire

For many centuries, beginning in AD 800, the Holy Roman Empire ruled

Rudolf I was Holy Roman emperor from 1273 to 1291.

over much of Europe. The lands of the empire originally included what are now Germany, Austria, the Czech Republic, Switzerland, The Netherlands, Belgium, Luxembourg, eastern France, and parts of northern and central Italy.

In its later centuries the Holy Roman Empire lost most of its power. Nevertheless, it lasted for more than 1,000 years, until 1806.

Beginnings

The western part of the Roman Empire came to an end in AD 476. The Roman Empire continued in the east as the Byzantine Empire. It was ruled from Constantinople, in what is now Turkey.

In the place of the western empire rose many tribal kingdoms. One of the tribes was the Franks. The modern country of France is named after the Franks. A Frankish ruler named Charlemagne conquered surrounding lands and became very powerful. In 800 Pope Leo III, the head of the Roman Catholic church, crowned Charlemagne emperor of the new Roman Empire.

The pope wanted a strong new empire with close ties to the church. However, soon after Charlemagne's death the empire broke apart. The western part became known as France. The eastern part became known as Germany. It continued the empire.

The title of emperor did not pass automatically from father to son. Local German rulers elected a German king. If the

An illustration shows the crowning of Emperor Louis I (right). Louis was the son of Charlemagne. Many rebellions broke out during Louis's reign.

pope agreed with the choice, he crowned the king emperor.

Saxon Emperors

By the middle of the 900s, a German people called the Saxons ruled the empire. The Saxon emperor Otto III, who reigned between 983 and 1002, made Rome his capital. For a long time afterward, popes and emperors quarreled over who had the right to choose religious leaders.

Hohenstaufen Emperors

Emperors of the Hohenstaufen family gained power in 1138. The Hohenstaufen emperor Frederick I Barbarossa added the word holy to the name of the empire. This was because he wanted to have as much respect as the pope had. Frederick died in 1190. Not long after that, the empire lost some of its earlier importance.

Hapsburg Emperors

In 1273 the Hapsburg family gained control of Germany. They soon centered their power in Austria. Hapsburg kings often took the title of emperor without being crowned by the pope. The Hapsburgs ruled the Holy Roman Empire almost continuously from 1452 onward.

End of the Empire

In the 1500s some people broke away from the Roman Catholic church and formed Protestant churches. This weakened the empire. German leaders who became Protestant opposed the Roman Catholic emperors.

After about 1650 the empire was only a loose grouping of German states. In 1806 Emperor Francis II finally ended the Holy Roman Empire. Francis continued to rule, however, as emperor of Austria.

Homeopathy

Homeopathy is a form of medical care. It is based on the idea that “like cures like.” This means that a drug that creates symptoms, or signs, of illness in a

Homeopathy is popular in many parts of the world. A store in Hong Kong has shelves full of homeopathic medicines.

Did You Know?

Homeopathic remedies are believed to help the body heal itself.

healthy person can be used to treat the same symptoms in a sick person.

Homeopathy started with German physician Samuel Hahnemann in 1796. Hahnemann did an experiment on himself. He took large doses of a drug to treat the disease malaria. He went from healthy to having symptoms of malaria. This gave him the idea of “like cures like.”

Hahnemann also thought that large doses of medicine made an illness worse. He believed that small doses were more effective. This idea is also a part of homeopathy.

Before homeopathy, doctors sometimes treated patients with methods that were harsh and even dangerous. For example, they might draw a lot of blood from a person’s body while trying to cure a disease. Homeopathy became popular because it was a milder form of treatment. But today many doctors dislike homeopathy. They prefer to look for the cause of an illness instead of focusing on the symptoms.

Homer

Homer was a poet in ancient Greece. Many people believe that he created the classic stories of the *Iliad* and the *Odyssey*. These long poems tell of historic events and heroic deeds during and after the Trojan War in ancient Greece. They have been translated into many lan-

Many artists made sculptures of Homer long after his death. However, no one knows for certain what he looked like.

guages. People all over the world still read them today.

Very little is known about Homer. Scholars think that he lived in the 800s or 700s BC in the region called Ionia (now in Turkey).

Homer was a poet in the oral tradition. This means that he traveled from place to place and recited poems aloud. The stories of the *Iliad* and the *Odyssey* were probably not written down until centuries after they were first recited.

Many scholars today also believe that the stories were written by more than one person. However, Homer is traditionally given credit for these works.

Honduras

In 1502 Christopher Columbus became the first European to see what is now the Central American country of Honduras. Columbus named the land Honduras, meaning “depths,” because of the deep waters off its coast. The capital of Honduras is Tegucigalpa.

Geography

Honduras has a long northern coast on the Caribbean Sea and a short southern coast on the Pacific Ocean. It borders Guatemala, El Salvador, and Nicaragua. Most of the land is mountainous. In the northeast is a swampy area called the Mosquito Coast. Honduras’ weather is warm year-round.

Plants and Animals

Evergreen forests of mahogany, balsa, and Spanish cedar trees grow in the lower mountains. Pines and oaks grow on the higher slopes. Mangrove and palm trees grow near the coast. Honduras’ wildlife includes crocodiles, snakes,

peccaries (piglike mammals), pumas, and toucans.

People

Nearly 90 percent of Hondurans are mestizos, or people with mixed Spanish and American Indian roots. There are smaller groups of Indians, blacks, and whites. The main language is Spanish. Roman Catholicism is the main religion. Most people in Honduras live in the west.

Economy

The economy of Honduras is based on manufacturing and farming. Factories make mainly food products and clothing. Major crops include bananas and coffee. Tourism is a growing industry.

History

American Indians, including the Maya, lived in what is now Honduras when Spanish colonists arrived in the early 1500s. Honduras gained independence from Spain in 1821. It was part of a political union called the United Provinces of Central America until 1838, when it became fully independent.

The Honduran military played a strong role in the country during the 1900s. In 1982 an elected, nonmilitary government came to power. Since then leaders have struggled to improve Honduras’ economy.

Hong Kong

Hong Kong is a region on the southeastern coast of China. It juts out into the South China Sea. Hong Kong's deep harbor makes it valuable for shipping.

Hong Kong covers an area of 425 square miles (1,102 square kilometers). It is made up of the main island called Hong Kong, Lantau Island, the Kowloon Peninsula, and some 200 small islands. Hong Kong also includes a region called the New Territories, to the north of Kowloon Peninsula. Victoria, on Hong Kong Island, is the center of business and government.

Hong Kong is home to many businesses and banks. It is one of the world's major trade and financial centers.

Hong Kong has a mixed culture. The people celebrate holidays of both the East and the West, such as the Lunar (Chinese) New Year and Christmas. Many people speak English as well as Chinese.

Hong Kong's economy is based on banking, investment, and international trade. Tourism and fishing are also important to the economy. In addition, Hong Kong is a major producer of motion pictures.

People have been living in the region of Hong Kong for more than 3,000 years. In 1821 British merchants began to use Hong Kong's harbor. Great Britain and China fought several wars in the mid-1800s. Britain won those wars, and it received control over Hong Kong for 99 years.

In 1984 Britain agreed to return Hong Kong to China. The Chinese agreed to make Hong Kong a special administrative region of China. This means that Hong Kong does not follow all the policies, or rules, that the rest of China does. Control of Hong Kong went back to China in 1997.

Hoof

Hooves are hard coverings that protect the toes of many animals. Hooves are not feet. They are more like toenails. Hooves allow animals to walk for long distances on hard surfaces without damaging their toes.

Horses, cattle, deer, pigs, sheep, camels, and other animals have hooves. Some

Hoof of a Horse

Horses have one hoof at the end of each leg. Horseshoes are nailed onto the hoof wall to protect the hoof.

animals, including horses and zebras, have a single hoof at the bottom of each foot. Other animals, including cattle and rhinoceroses, have separate hooves covering each toe.

Structure

Hooves are made of a protein called keratin. Keratin also makes up hair, fingernails, horns, and feathers. Even though hooves are hard and tough, they wear down with use. But like hair, hooves continue to grow throughout an animal's life.

Hooves are not one solid piece. They grow in layers. Dead cells make up the hard, outer shell of the hoof. This part of the hoof, called the hoof wall, supports the animal's weight. It also protects the softer parts of the toe.

Inside the wall of the hoof is a spongy growth called the frog. The frog acts as a cushion. Without the frog, an animal's leg bones could be damaged by walking on hard surfaces. The frog also pumps blood through the hoof as the animal walks.

The only part of the hoof that grows is the area where it attaches to the toe. If the hoof cracks or is damaged, it cannot grow back together in the same way that a cut heals. It must grow from the inside out.

Hoof Protection

Working animals, especially horses, benefit from having metal shoes attached to the bottom of their hooves. These horseshoes protect the hooves from cracks

and too much wear. People nail the shoes onto the hoof wall. This does not hurt the horse because the hoof wall is dead tissue.

Hoover, Herbert

In 1929 Herbert Hoover became the 31st president of the United States. Soon after his election the country sank into the Great Depression. Hoover had helped starving people in Europe during World War I. However, he could not help the millions of U.S. citizens who lost their jobs during the depression.

Early Life

Herbert Hoover was born on August 10, 1874, in West Branch, Iowa. Herbert's

Herbert Hoover was the 31st president of the United States.

father, Jesse Clark Hoover, was a blacksmith. He died when Herbert was 6 years old. Herbert's mother, Hulda Minthorn Hoover, died three years later. After his parents died, Herbert moved to Newberg, Oregon, to live with his uncle and aunt.

Career

Hoover graduated from Stanford University in 1895 with a degree in geology. He became a mining engineer and worked in many countries, including China. In 1899 Hoover married Lou Henry. The couple had two sons. Hoover eventually started his own engineering firm with offices around the world.

During and after World War I (1914–18), Hoover headed organizations that sent food to soldiers and hungry people in Europe. From 1921 to 1928 Hoover served as secretary of commerce under presidents Warren G. Harding and Calvin Coolidge. He supported efforts by workers to improve their conditions. He also supported major engineering projects, including the construction of the Hoover Dam.

Presidency

The Republican Party chose Hoover to run for president in 1928. He easily defeated the Democratic candidate, Alfred E. Smith. When Hoover took office, the economy was strong. In October 1929, however, the stock market crashed, and the worst depression in U.S. history began.

Did You Know?

Hoover worked to relieve hunger in Europe, Asia, and South America in the 1940s.

TIMELINE

Hoover is born in West Branch, Iowa.

August 10, 1874

Hoover is elected president.

1928

Hoover loses the presidential election to Franklin D. Roosevelt.

1932

Hoover dies in New York City.

October 20, 1964

Hoover becomes secretary of commerce.

1921

The stock market crashes and the Great Depression begins.

October 29, 1929

Hoover heads a group that reorganizes U.S. government departments.

1947–49

Hoover quickly asked companies not to fire workers or cut wages. But many people had already lost their jobs. Hoover encouraged state and local governments to join private charities in caring for the new poor. He also approved a program that lent government money to states, banks, and companies. Hoover refused to give money directly to citizens, though. As the Great Depression worsened, the public began to blame the president.

Retirement

Hoover ran for reelection in 1932, but the Democratic candidate, Franklin D. Roosevelt, won. Hoover disagreed with the way Roosevelt handled the depression. He later helped reorganize several government agencies. Hoover died in New York City on October 20, 1964.

Hopewell Culture

The prehistoric Native Americans of the Hopewell culture lived in east-central North America between about 200 BC and AD 500. They lived mainly in what is now southern Ohio.

The Hopewell Indians are best known for the earth mounds they built. Like the Indians of the Adena culture who came before them, they built large mounds in which they buried the bodies of important people. They also created earthworks in geometric shapes such as circles, rectangles, and octagons.

The Hopewell Indians lived in villages along rivers and streams. They built dome-shaped houses covered with bark, animal hides, or woven mats. They got their food by hunting, fishing, and gathering wild nuts, fruits, seeds, and roots.

Hopewell Indians shaped objects out of copper.

They also grew crops such as corn and possibly beans and squash.

By about AD 400 the Hopewell culture began to decline. No one knows for sure what happened to it. Some scientists think that a long drought or change in climate brought about a food shortage. Others believe that the Hopewell Indians began to fight each other over farmland or that they were overwhelmed by more warlike tribes.

Hopi

The Hopi are one of the Native American groups known as Pueblo Indians. Many Hopi live on a reservation in northeastern Arizona, in the United States. This land is part of their traditional homeland. Like the other Pueblo Indians, the Hopi are descendants of the Anasazi people. The Anasazi are also known as the Cliff Dwellers.

The Hopi traditionally lived in homes made of stone and adobe, or sun-baked clay. Their houses had flat roofs and were sometimes several stories high. They were often joined together in groups similar to modern apartment buildings.

The Hopi grew corn, beans, squash, melons, and other fruits and vegetables. They also raised sheep. Hopi women made baskets and fine pottery.

Spanish explorers arrived in Hopi lands in 1540. In 1680 the Hopi joined other Pueblo Indians in a revolt against the Spanish. They drove the Spanish from their lands for 12 years. The Spanish reconquered the area in 1692. Later the land was ruled by Mexico.

The United States took control of the land in 1848. In 1882 the U.S. government set up a reservation for the Hopi. The Hopi reservation is surrounded by

Hopi dancers perform at a celebration in Washington, D.C.

the much larger reservation of the Navajo. This has led to disagreements between the Hopi and the Navajo over land. At the end of the 20th century there were more than 10,000 Hopi living in the United States.

Hormone

Just about every living thing made up of more than one cell produces hormones. Hormones are chemicals that tell cells and body parts to do certain things. For example, hormones tell the body when to grow and when to stop growing.

In humans and other animals, organs called glands release hormones into the blood. Together these glands make up the endocrine system. Other organs, such as the stomach and the small intestine, also release hormones.

One type of hormone controls how much a person grows. A man who had too much growth hormone grew to be more than 8 feet (2.4 meters) tall.

Types of Hormones

Plants produce hormones that control their growth. Plant hormones also cause flowers and fruit to grow.

Insects make hormones, too. One hormone causes insects to molt, or shed their exoskeletons. Others cause metamorphosis (the change from baby to adult).

Insects and many other animals release hormones called pheromones into their habitats. These pheromones can attract mates, mark the location of food, or warn other animals of danger.

The human body makes more than 20 major hormones. Growth hormone helps to build muscles. Adrenaline, also called epinephrine, makes the heart beat fast during stressful times. Insulin controls the level of sugar in the blood. Estrogen causes girls to grow into women. Testosterone causes boys to grow into men.

How Hormones Work

In humans, hormones travel through the blood to cells throughout the body. Many different hormones may be in the blood at one time. Each hormone can affect only a certain type of cell. These cells are known as target cells. A hormone travels to its own target cells and locks onto them. When this happens, the hormone causes the cells to start or to stop certain activities.

Blood • Cell • Endocrine System

Horn

Many animals have hard structures, called horns, growing from their heads. Most horned animals also have hooves. Sheep, cattle, goats, and antelope are some of the most common horned animals.

Structure

Horns are hollow and pointed. They are attached to the bone of an animal's head. Horns are made of keratin, a type of protein. Keratin is the same material that makes up hooves, hair, fingernails, and feathers. Animals may be born with those things, but animals are not born with horns. The horns grow as the animals get older.

Horns grow in pairs, one on each side of the head. Horns vary greatly in size and shape. Bighorn sheep have large, curled horns. Antelope have long, thin horns that point upward. Oxen have long, heavy horns that stick out from the sides of their heads.

Uses

Animals use horns as weapons to protect themselves from enemies. They also use their horns in battles with other animals

of their kind. In some types of animals, only the male has horns. In others, both males and females have horns. A large set of horns may impress mates. They show that the animal has lived a long time and can defend itself.

False Horns

Hornlike antlers grow from the heads of deer, elk, and moose. Antlers are not true horns, however. They are bone with a velvety covering. Antlers fall off every year. Horns never fall off.

Many lizards have bony stalks that look like horns. Giraffes have knobby growths made of bone covered with skin and hair. The single horn of a rhinoceros is actually made of hardened hairs that are tightly bunched together.

Horse

The horse is a mammal that people have valued for thousands of years. In the past people commonly used horses to get from place to place and to pull heavy loads. People still use horses in sports and recreation. The scientific name of the horse is *Equus caballus*.

Where Horses Live

Horses once roamed free over grasslands in North America, South America, Europe, Asia, and Africa. Today, however, almost all horses are domesticated, or tamed. Domesticated horses are kept by people all over the world.

Did You Know?

People make horns into tools, containers, musical instruments, and even traditional medicines.

Animal horns grow in many different shapes.

Przewalski's horse has a short mane that stands upright.

The only surviving type of horse that has never been tamed is called Przewalski's horse. It now lives mostly in zoos. Other horses that roam free came from horses that were raised by people. These horses include the mustangs of western North America.

Physical Features and Breeds

Horses are large and very strong. A typical domesticated horse stands 5 feet (1.5 meters) tall at the shoulder. It weighs about 1,150 pounds (520 kilograms).

A horse's legs are strong even though they look very slender. A horse's foot is actually a single toe protected by a hard covering called a hoof. The hoof is made of the same material as a human toenail or fingernail.

Over the centuries people have bred horses to have features that they considered useful or desirable. The breeds can be grouped into three general types: light horses, heavy horses, and ponies. Light horses are used mostly for riding.

They include the Thoroughbred, a breed that is used for racing. Heavy horses, also called draft horses, can pull heavy wagons. Some heavy horses weigh more than 2,000 pounds (900 kilograms). The smallest breeds are called ponies. Some ponies weigh only 385 pounds (175 kilograms) or less.

Behavior

Horses eat grass. Most free-living horses graze and wander in groups called bands. One type of band is called a breeding band. A breeding band usually has one adult male, several adult females, and their young. A bachelor band consists of males only.

Horses have several gaits, or ways of stepping. The fastest gait is called a gallop. A slower gallop is called a canter. The trot is slower than the canter. The walk is slowest of all.

Life Cycle

About 11 months after mating, a female horse usually gives birth to a single

A pony ride is a treat for a child.

young, or foal. Within a few hours after birth, a healthy foal is on its feet. Horses usually live between 20 and 35 years, but some have survived past age 40.

Horses and Humans

People hunted horses until they learned to tame them. Scientists believe that people first tamed horses in central Asia, probably long before 2000 BC.

Warhorses

Ancient people used horses in wars. By about 1,600 BC people in southwestern Asia were fighting on horseback. They also fought in chariots, which were wheeled vehicles pulled by horses. About 800 years later Asians brought horses to Europe. The army of ancient Rome included troops on horseback.

During the Middle Ages (AD 500 to 1500) warriors called knights rode heavy horses. When warriors stopped wearing armor, they switched to lighter and faster horses.

Workhorses

At first horses could not pull heavy loads without hurting themselves. Then, in the 1100s, people started using padded horse collars. A horse with a collar could pull a plow. Horses also pulled railroad cars and other vehicles. Horses were a major source of power until the 1900s, when machines took over the work.

Horses in Sports

Horse racing is an ancient sport. As early as 700 BC the Olympic Games of ancient Greece featured horse races.

The Kentucky Derby is the most important Thoroughbred horse race in the United States.

Today horses race on oval tracks or straight courses. Some courses have obstacles that the horse must jump over. In harness racing the horse pulls a two-wheeled vehicle with a driver.

Horses and riders also compete in jumping or riding sports known as equestrian events. The Olympic Games feature equestrian events. Other sports that use horses include polo and rodeo.

Hospital

A hospital is a place where people go for medical attention and treatment. Someone needing help for a serious illness or injury may go to a hospital. Women also go to hospitals to have babies. People may stay in a hospital for a few hours or for many days.

A girl greets her newborn sister in the nursery of a hospital.

Types of Hospitals

General hospitals handle most medical problems. Special hospitals focus on certain diseases, such as cancer. Others care for specific groups, such as older people or people with mental illnesses. Medical schools run teaching hospitals to train doctors.

Religious and educational groups own many hospitals in the United States and Canada. They do not keep any money made by the hospital. Some U.S. hospitals are owned by companies that do try to make money. Governments own and run most hospitals in the rest of the world.

Hospital Divisions

Most hospitals are divided into areas with different purposes. The emergency room handles sudden illnesses and injuries. Patients with breathing problems or bad burns go to the intensive care unit. For surgery, patients go to an operating room. Women having babies go to the labor and delivery department. The

laboratory does medical tests. The pharmacy prepares medicines.

Doctors guide the care of hospital patients. Nurses follow doctors' instructions and make patients comfortable.

History

In the 400s BC Hindus in what is now Sri Lanka created the first known hospitals. The ancient Romans also treated patients in hospitals. Christians later created many hospitals in Europe. The first medical hospital in the United States was founded in 1751. It treated mainly poor people.

As medicine got better, more middle-class and wealthy people went to hospitals. Today most people in developed countries are born in a hospital, and many die in one.

Houston

Population
(2000 census),
city, 1,953,631;
(2007 estimate)
2,208,180

Houston is the largest city in the U.S. state of Texas. It is also the fourth largest city in the United States. The city owes

much of its growth to its large oil and natural gas industries.

The Lyndon B. Johnson Space Center in Houston is home base for U.S. astronauts. The center controls space flights and does research for the National Aeronautics and Space Administration (NASA).

Several large oil and energy companies have headquarters in the Houston area. Many factories in the city process oil into gasoline, diesel fuel, and chemicals. Houston is the second busiest port in the United States. Ships reach the city from the Gulf of Mexico through a waterway called the Houston Ship Channel.

Health care also fuels the Houston economy. The Texas Medical Center is one of the largest medical centers in the United States.

Houston was founded in 1836, the year that Texas won its independence from Mexico. It was named for Sam Houston, a hero of Texas' war for independence.

Huang He

The Huang He is the second longest river in China. (The Yangtze River is the longest.) The name Huang He means "Yellow River" in Chinese. The river got its name from the color of its muddy waters. A great Chinese civilization

developed along its banks by about the 1700s BC.

The Huang He is 3,395 miles (5,464 kilometers) long. It begins in mountains that rise from the Plateau of Tibet in western China. There the river drops rapidly through deep mountain gorges.

The middle course of the river is a great loop. Much of it runs through the Loess Plateau. This region is named for its crumbly soil, called loess. Large amounts of soil wash into the river.

The lower course stretches east across the North China Plain. The river empties into the Yellow Sea, which is a part of the Pacific Ocean.

Floodwaters from the Huang He deposit silt (soil particles) on the North China Plain. Crops grow well in silty soil. People have grown crops on the North China Plain for thousands of years.

Since before 500 BC, people have built earth barriers called levees to protect villages near the Huang He from floods. A break in a levee can cause a major disaster. The river now has large dams that control floods, provide electric

power, and hold back water for use in farming.

Hudson Bay

Hudson Bay is a large sea in northeastern Canada. It is named for Henry Hudson, an English explorer. Hudson discovered the bay in 1610 while looking for a way to sail west from Europe to Asia.

The weather at Hudson Bay is harsh. Snowstorms and strong winds are common in winter. Floating sheets of ice cover much of the bay during the coldest months.

Most of the coast of Hudson Bay is lined with marshes. The marshes sit on top of permafrost, or permanently frozen soil. Mosses, lichens, and small trees and bushes grow along the shore. Some pine forests grow near the shore in the south.

Hudson Bay was once very important to the economy of Canada. The Hudson's Bay Company built and operated fur-trading posts along the shore. Today the Canadian government does not allow much economic activity on the bay. It wants to protect the area. Native people who live in small villages around the bay are allowed to fish and hunt sea mammals.

Canada • Hudson's Bay Company
• Marsh

Hudson's Bay Company

The Hudson's Bay Company is the oldest company in Canada. It was started in 1670 as a fur-trading company. Today the company runs department stores throughout Canada.

In the 1600s both rich Europeans and poor settlers in North America wore clothing and hats made of fur. Explorers

The Hudson's Bay Company had many small buildings called stations in the Canadian Arctic region.

in North America searched for animals that could provide this fur.

Two French traders found many beavers as they traveled along the coast of Hudson Bay, in Canada. With the help of the king of England, they formed a company to trade beaver pelts, or skins, for other goods.

The Hudson's Bay Company built trading posts along the coasts of Hudson Bay, James Bay, and the Arctic Ocean. The company traded with Native Americans, who brought pelts from beavers, foxes, bears, and wolves. In exchange for the pelts, the company gave the Indians such goods as weapons, gunpowder, beads, fishhooks, axes, sewing needles, scissors, cooking pots, and wool blankets.

In the late 1800s the demand for beaver pelts began to fall. The Hudson's Bay Company had to find new goods for trade. By the early 1900s the Hudson's Bay Company had turned its trading posts into shops. It also built department stores in Canadian cities. By the late 20th century the company no longer traded in furs.

Hughes, Langston

The writer Langston Hughes was an important figure of the Harlem Renaissance. This was a period of great creativ-

Langston Hughes

ity among African American artists. Hughes wrote about the joys and sorrows of ordinary blacks. He is known especially for his poetry.

James Mercer Langston Hughes was born on February 1, 1902, in Joplin, Missouri. He lived in many different places as a child. He started writing poetry while in high school in Cleveland, Ohio.

In 1921 Hughes entered Columbia University in New York City. He was so unhappy that he left school after a year. Then he took time to explore Harlem, a mostly black New York City neighborhood. There he met other people interested in writing about the experiences of African Americans.

Hughes's career as a writer took off in 1925. He was working as a busboy at a hotel in Washington, D.C. He showed his poems to U.S. poet Vachel Lindsay while Lindsay dined at the hotel. Lind-

say helped call the country's attention to Hughes's work. Hughes then received a scholarship to attend Lincoln University in Oxford, Pennsylvania. He graduated in 1929.

Hughes published his first book of poetry, *The Weary Blues*, in 1926. His most famous work may be *Montage of a Dream Deferred* (1951). This book-length poem describes the challenges faced by African Americans living in cities.

In addition to poetry, Hughes also wrote novels, plays, essays, short stories, and children's books. He died in New York City on May 22, 1967.

Huguenots

Beginning in the early 1500s, many Christians left the Roman Catholic church and started new churches. They were known as Protestants. The Protes-

After the Huguenots lost their rights in 1685, they had to meet in secret.

tants of France were called Huguenots. Many Huguenots suffered cruel treatment because of their religion.

The Huguenots were also known as French Calvinists. This was because they followed the teachings of the Protestant leader John Calvin. Many Huguenots were poor people, but others were wealthy nobles. A few became powerful leaders of the Protestant movement in France.

A period of wars between Huguenots and Catholics began in about 1560. On the night of August 24, 1572, Roman Catholics killed almost all the Huguenot leaders in Paris. This was called the Massacre of Saint Bartholomew's Day. Catholics killed thousands of Protestants all over France during this time.

In April 1598 King Henry IV gave the Huguenots some rights. In 1685, however, King Louis XIV took away the Huguenots' rights. More than 400,000 Huguenots then left France. Some went to England. Others went to the Netherlands or America. Protestants did not get the same rights as Catholics in France until the beginning of the French Revolution in 1789.

Human Origins

The study of human origins, or beginnings, involves figuring out how and when human beings began to exist. Sci-

The earliest forms of humans evolved from apelike animals. Modern humans evolved from these early humans.

Scientists have many different theories about human origins. In fact, they form new theories about this all the time. But scientists agree that humans developed over many millions of years from early ancestors that were like apes. The process by which one type of living thing develops into another type is called evolution.

Modern humans evolved in stages from a series of ancestors, including several earlier forms of humans. The bodies of these ancestors changed over many years. In general, their brains became much larger. Their jaws and teeth became smaller. Human ancestors also began walking upright on two feet and using tools. As this happened, the shape of their legs, feet, hands, and other body parts changed.

Fossils

Scientists have a fairly small amount of evidence to use in studying human origins. Most of this evidence comes from fossils, or the remains of living things preserved in the ground. The study of

Neanderthal fossils were found in Israel.

fossils is called paleontology. In Africa, Asia, and Europe scientists have found the bones and tools of human ancestors who lived millions of years ago. And scientists continue to find new clues as to how humans developed.

Apes and Humans

Humans did not evolve from apes. Instead, modern humans and apes both developed from the same apelike ancestor. The ancestors of humans became separate from the ancestors of apes between about 8 million and 5 million years ago. After that each group developed on its own.

Modern humans and apes are still closely related. In fact, most scientists

consider humans and great apes—chimpanzees, bonobos, gorillas, and orangutans—to belong to the same scientific family.

But there are a number of important differences between humans and apes. For this reason scientists have divided the family into three smaller groups: the Ponginae, Gorillini, and Hominini. Orangutans belong to the Ponginae group. Gorillas, chimpanzees, and bonobos belong to the group called the Gorillini tribe. Humans belong to the Hominini tribe. The term hominin refers to modern humans and all their ancestors from the time they began developing separately from those of apes.

It took millions of years for modern humans to evolve from an apelike ancestor. Great apes evolved separately from the same apelike ancestor.

Hominins

Today only one species, or type, of hominin exists—modern humans. In the past two or more species of hominin often lived at the same time. Scientists do not always agree about which species are the direct ancestors of other species. But all hominins are closely related.

Australopithecines

Some of the earliest hominins are known as australopithecines. There were several different species of this group. Fossils show that they lived in Africa from roughly 4 million to 2.5 million years ago. One of the most famous such fossils is “Lucy”—a partial skeleton found in Ethiopia. These bones are about 3 million years old.

The australopithecines had some apelike features. For instance, their brains were much smaller than modern human brains. They could also climb trees easily. But, like humans, they walked on

Australopithecine individuals left their footprints in Tanzania about 3.5 million years ago.

The brains of human ancestors increased in size over time. The large, complex brains of modern humans make them the most intelligent animals on Earth.

two feet. Scientists know this from studying leg, knee, foot, and pelvis fossils. In addition, they found a set of footprints preserved in the ground in Tanzania.

Humans

Early forms of humans first existed about 2 to 1.5 million years ago. All species of humans belong to a scientific group within the hominin tribe called *Homo*. The scientific names of all human species begin with the word *Homo*, which means “man.” These early humans had larger brains and mostly smaller teeth and jaws than the australopithecines. Their behavior was probably also more like that of modern humans. For instance, an early human species called *Homo habilis* used stone tools to butcher animals. Later human species included *Homo erectus* and *Homo heidel-*

Did You Know?

Many Neanderthal bones were found in caves. This caused some people to think of Neanderthals as "cavemen."

bergensis. Scientists believe that these humans used fire to cook food.

The humans called Neanderthals were alive for part of the same time as modern humans. The Neanderthals died out about 28,000 years ago. They were closely related to modern humans. But most scientists think that these humans were not the direct ancestors of modern humans.

Modern humans probably developed between 200,000 and 100,000 years ago. The scientific name of the species is *Homo sapiens*. Many scientists believe that the first modern humans evolved in Africa and then spread through Asia and Europe and later the Americas. Exactly how modern humans emerged is a question that scientists are still studying.

Human Rights

A right that all people are born with is called a human right. Many people now agree that there are a number of human rights. Some of the most basic rights are the right to live and the right to believe what one chooses. Many people also think that a government should protect the human rights of all its people.

Civil Rights and Human Rights

Governments grant civil rights in their constitutions and laws. Human rights

Children in India carry candles to mark International Human Rights Day.

are slightly different. Some people believe that God grants human rights. Other people believe that human rights are a part of nature. The right to get a driver's license is a civil right. The freedom to travel is a human right.

Kinds of Human Rights

People believe in many kinds of human rights. Some kinds of rights put limits on the power of government. Examples of these rights include the right to freedom, the right to equal treatment under the law, and the right not to be tortured.

Other kinds of rights sometimes require governments to provide services. They include the right to a free education, the right to be protected from unemployment, the right to food, and the right to housing.

Still other rights require world cooperation. These include the right to peace and the right to live in a healthy environment.

Human Rights Through the Ages

Early Times

People in many early societies had no rights. They had only duties that they owed to their ruler.

The ancient Greeks and Romans were probably the first people to think much about rights. A Roman group called the Stoics believed in something that they called natural law. They said that natural law gave some rights to everyone, even people who were not citizens of Rome.

The Enlightenment and Afterward

The 1600s and 1700s were a time in European history that is called the Enlightenment. John Locke of England was an Enlightenment thinker who wrote that individual rights are older than governments. Jean-Jacques Rousseau of Switzerland argued that the purpose of governments is to protect those rights. Other thinkers called such rights “the rights of man.”

The American Revolution (1775–83) and the French Revolution of 1789 grew out of these ideas. The U.S. Declaration of Independence lists “Life, Liberty, and the pursuit of Happiness” as rights that “all men” get from God. French people wrote the Declaration of the Rights of Man and of the Citizen.

But even in the United States, many people did not enjoy full human rights. Slaves had almost no rights, and women had limited rights. Most slaves did not gain the basic human right of freedom until the 1800s. Women in most countries did not gain the same rights as men until the 1900s.

Human Rights Since World War II

After World War II (1939–45), the world learned that Nazi Germany had killed millions of Jews and other civilians (people not fighting the war). This crime is called the Holocaust. An international court at Nuremberg, Germany, put Nazi leaders on trial for “crimes against humanity.” The Holocaust convinced many countries that it was necessary to protect the basic rights of people everywhere.

A number of these countries formed an organization called the United Nations (UN) in 1945. In 1948 the UN issued a document called the Universal Declaration of Human Rights. The declaration calls for “human rights” instead of “the rights of man” because it includes women’s rights. The declaration has 30 articles, or sections. They mention many different rights.

Hummingbird

A hummingbird is a small bird with a long, slender bill. Many hummingbirds have brightly colored, glittery feathers. Often the males are more colorful than the females. The birds are named for the humming sound made by the rapid beating of their wings.

There are about 320 kinds of hummingbird. They live only in the Americas.

Most of them live in the warmer parts of South America. About 12 kinds are found regularly in the United States and Canada.

All hummingbirds are small, and many are tiny. The largest of these birds is only about 8 inches (20 centimeters) long. It is called the giant hummingbird. The bee hummingbird is slightly longer than 2 inches (5 centimeters). It is the smallest living bird of any kind.

Hummingbirds have long wings and muscular bodies. They can fly forward, sideways, straight up or down, and even backward. Hummingbirds also hover, or hang in one place while beating their wings. Some small hummingbirds beat their wings 80 times per second.

Hummingbirds feed mainly on nectar, a sweet liquid made by flowers. The bird hovers in front of the flower and reaches inside with its long, curved bill. Hummingbirds drink nectar at the rate of about 3 to 13 licks per second.

A green violet-ear hummingbird feeds on nectar from an orchid.

Grains of pollen often stick to hummingbirds while they are feeding. They carry the pollen from flower to flower. This helps the plant to reproduce.

Hun

The Huns were one of the most feared groups of their time. They were fierce warriors who fought skillfully with bow and arrow on horseback. In the AD 300s and 400s they controlled a huge empire in Europe.

The Huns came from a place in eastern Asia known as Mongolia. They were animal herders who had no settled homes. They moved westward across the grasslands of central Asia with their animals.

The Huns arrived in southeastern Europe in about AD 370. During the next 70 years they conquered peoples there and in central Europe. They

attacked both the eastern and western parts of the Roman Empire.

For many years the Huns did not have a central leader. The first known king to rule the Huns was Rugila, or Rua. He took control sometime before 432. After he died in 434 his nephews Bleda and Attila took over. The two shared power until 445, when Attila killed Bleda.

Attila became one of the world's most famous warriors. He attacked the Byzantine Empire and greatly damaged it. In 451 he invaded Gaul but was defeated. During his reign Attila expanded the Hun Empire.

After Attila died in 453 his many sons divided up the Hun Empire. They began fighting among themselves. Then the people of the empire rebelled. The Huns were defeated in 455. By the end of the century the Huns were no longer a united group.

Hungary

Foreign powers controlled the central European country of Hungary for more than 600 years. After moving away from a Communist form of government in 1989, Hungary drew closer to the countries of western Europe. The capital is Budapest.

Geography

Hungary borders Slovakia, Ukraine, Romania, Serbia, Croatia, Slovenia, and Austria. The Danube and the Tisza are Hungary's major rivers. Lake Balaton, in the west, is the largest lake in central Europe.

A low plain, called the Great Alföld, covers the central and eastern parts of Hungary. A smaller plain, the Little Alföld, is in the northwest. The plains are separated by highlands. Transdanubia is a region of hills in the southwest. In the northeast are the Northern Mountains. They contain the country's

The building where Hungary's government makes laws is near the Danube River in Budapest.

highest point, Mount Kékes, at 3,327 feet (1,014 meters).

Hungary has a continental climate, meaning that summers are hot and winters are cold. The Great Alföld contains the driest part of the country. The southwestern highlands are the wettest.

Plants and Animals

Over the years most of Hungary's forests have been cleared for farming. Today forests cover about one fifth of the land. Beech trees grow at the highest elevations. Poplar and oak trees are common, and willows grow along many riverbanks.

© 2006 Encyclopædia Britannica, Inc.

Deer and wild pigs live in the forests at high elevations. Partridges, pheasants, hares, and rodents are common in the lowlands. Bream, pike, perch, and many other kinds of fish are found in the rivers and lakes.

People

Most of the people are ethnic Hungarians. They are descended from the ancient Magyars, who came from an area near the Ural Mountains more than a thousand years ago. There are small groups of Roma (Gypsies), Germans, Slovaks, Jews, and others. Because Hungary is much smaller than it once was, many ethnic Hungarians live in neighboring countries.

Most of the people speak Hungarian, or Magyar, which is the official language. More than half of the people are Roman Catholics. A large number of people are not religious. The majority of Hungarians live in cities or towns.

Economy

Services—including banking, education, and tourism—are the main economic activities. Manufacturing is also important. Products manufactured in Hungary include computers, motor vehicles, food and beverages, machinery, and chemicals. The country's major mineral resource is bauxite, which is used to make aluminum.

Agriculture is a smaller part of the economy. Hungary's leading crops are wheat, corn, sugar beets, grapes, sunflower seeds, potatoes, and apples. Farmers also raise cattle, sheep, pigs, and poultry.

History

The western part of what is now Hungary became a province of the Roman Empire in 14 BC. Germanic and Asian peoples lived in the eastern part. In the AD 400s the Magyars began migrating toward Hungary from the east. Under their leader Árpád, they began to settle along the middle part of the Danube River in the late 800s and early 900s.

The Magyars' most celebrated leader, Stephen, was crowned king in about 1000. He spread Christianity in Hungary. He also organized the kingdom into a strong and independent state. Hungary was the leading power in east-central Europe in the 1100s.

Foreign Control

An invasion by the Mongols in 1241 killed half of Hungary's population. For most of the next six centuries, foreign

TIMELINE

Stephen is crowned king of Hungary.		The Austrian Hapsburgs take over Hungary.		Austria-Hungary collapses after World War I.		Hungary holds free elections.
about 1000	1526	1699	1867	1918	1947	1990
	The Ottoman Turks defeat the Hungarian army.		The Hapsburgs form the empire of Austria-Hungary.		Communists take power in Hungary.	

kings or foreign empires ruled Hungary. The Turks made Hungary part of the Ottoman Empire in the 1500s. In the late 1600s the Hapsburg family of Austria took control of the region.

Hungarians started a revolution against Hapsburg rule in 1848, and a year later Hungary declared its independence. With Russian help, the Hapsburgs regained control. The Hapsburgs realized, however, that their empire could not continue without Hungarian support. In 1867 they agreed to establish the double monarchy of Austria-Hungary.

World Wars and Communist Rule

Austria-Hungary was defeated in World War I (1914–18). Afterward, Romania, Czechoslovakia, Yugoslavia, Austria, Poland, and Italy all received parts of Hungary. Hungary was left with only the areas where the Magyars were dominant. In an attempt to regain some of its lost territory, Hungary cooperated with

the Germans against the Soviet Union during World War II (1939–45). Hungary was defeated, however, and Soviet troops took control by April 1945.

In 1947 a Communist government came to power in Hungary. Hungarians rose up against the Communists in 1956, but Soviet troops crushed the revolt. Thousands of people died, and about 200,000 people fled the country. Communist rule later became less harsh, and living conditions in Hungary improved. Soviet control also relaxed in the late 1980s.

Recent Events

Hungary's Communists voluntarily gave up their power in 1989. Hungary held free elections in 1990. The country drew closer to western Europe. It joined the North Atlantic Treaty Organization in 1999 and the European Union in 2004.

Huron

► see Wyandot.

Huron, Lake

Lake Huron is the second largest of the five Great Lakes of North America. It covers an area of 23,000 square miles (59,570 square kilometers). French explorers named the lake after the Huron Indians.

Lake Huron lies along the border between the United States and Canada. The U.S. state of Michigan is to the west. The Canadian province of Ontario is to the north and east.

Water flows into Lake Huron from two main sources. The first is Lake Superior. Its water flows into Lake Huron through the Saint Marys River. The second source is Lake Michigan. The Straits of Mackinac connect Lake Michigan with Lake Huron. At its southern end Lake Huron empties into Lake Erie.

Lumbering and fishing are major economic activities in the Lake Huron region. International shipping is also important. Goods are shipped through the Saint Lawrence Seaway. The seaway links the Great Lakes with the Atlantic Ocean.

Many resorts line Lake Huron's shores. Georgian Bay, in the northeastern part of the lake, is a popular summer resort area. Many tourists visit Georgian Bay Islands National Park and the Thirty Thousand Islands.

Hydra

A hydra is a tiny animal that lives in water. Hydras can regrow parts of their bodies. They are named after an imaginary creature from Greek mythology, the nine-headed hydra. According to the myth, this monster could grow two new heads for each head that was cut off.

The real-life hydra is only about 1.2 inches (3 centimeters) long. It has a thin, tubelike body with an opening at the top. The opening is used both to eat food and to get rid of waste. Long, fingerlike tentacles grow around this opening. The hydra uses its tentacles to

A new hydra can be seen budding from an existing one. The new hydra is a smaller and paler version of the first one.

sting and paralyze its food. It eats tiny animals.

The hydra can reproduce in two ways. It can release eggs, which are then fertilized in the water. The fertilized eggs grow into new hydras. It can also reproduce by budding. During budding, a hydra grows a new body that finally nips off at its base to make a new hydra.

Hyena

Hyenas are mammals of Africa and Asia. They look something like dogs, but they are not related to them. There are three species, or types, of hyena: spotted, striped, and brown. The spotted hyena is known for its hunting cry, which sounds like human laughter.

Hyenas are gray, brown, or yellowish. Some have stripes or spots. Their front legs are longer than their hind legs. The spotted hyena is the largest species.

Female spotted hyenas are larger than males. Females measure about 6 feet (1.8 meters) long and weigh 175 pounds (80 kilograms).

Hyenas have large heads with jaws and teeth that are strong enough to crush bones. Their excellent senses of hearing and smell help them to find prey.

Hyenas live on dry grasslands with few trees. They find shelter in caves or empty underground tunnels, or burrows. Hyenas are most active at night. They live alone or in packs. Spotted hyenas may form packs of 80 or more animals. Within groups spotted hyenas communicate using signals and sounds.

Hyenas are often seen waiting to feed on what is left of a zebra or gazelle after lions are done with it. Sometimes the prey animal was actually killed by the hyenas and then stolen by the lions.

Ibis

Ibises are birds with long, slender bills that curve downward. They are wading birds, meaning that they typically walk through shallow water when feeding. They usually feed, fly, and breed in huge groups. The ancient Egyptians believed that one particular type of ibis was holy. After these birds died, the Egyptians carefully preserved them as mummies.

There are about 20 species, or types, of ibis. They belong to a scientific family that also includes spoonbills. As its name suggests, a spoonbill has a beak with a rounded tip that looks like a spoon. Ibises are also related to herons, storks, and flamingos.

Ibises are found in most of the world's warm and hot regions. They tend to live near shallow bodies of water, including marshes, lagoons, lakes, and bays.

Ibises are usually about 22 to 30 inches (55 to 75 centimeters) long. Their legs,

The white ibis lives in North and Central America. Its pink face is bare of feathers.

neck, and bill are long. The tail is short. Most ibises have white, black, or brown feathers. However, the scarlet ibis is bright red. The hadada ibis has greenish feathers, and the glossy ibis has dark brown and shiny purple feathers. In many ibises part of the face lacks feathers but has brightly colored skin.

An ibis uses its long bill to search the mud for food. Ibises eat such animals as shellfish, insects, worms, and small fish.

Ice Age

An ice age is a time when thick ice sheets called glaciers cover huge areas of land. An ice age may last for millions of years and can cause big changes to Earth's surface. Ice ages have happened a number of times throughout Earth's history.

The Latest Ice Age

The latest ice age began more than 1.8 million years ago and ended about 10,000 years ago. During this period huge glaciers formed and spread south from the North Pole. Several times these glaciers partly melted so they covered less area. At times glaciers covered all of Canada, much of the United States, and

most of northwestern Europe. The ice was hundreds or even thousands of feet thick.

The lands just south of the glaciers were colder than they are today. The ground near the edges of the glaciers was permanently frozen. Nevertheless, there was a variety of plant and animal life. Few trees could grow, but grasses and some flowering plants covered the land during warmer seasons. Many large mammals, including reindeer, musk-oxen, and woolly mammoths, roamed the land. By the end of the latest ice age, modern humans were living south of the glaciers as well.

Causes and Effects

Scientists are not sure what caused the ice ages. Changes in Earth's orbit around the sun may be one cause. These changes would have caused parts of Earth to receive less heat from the sun at certain times. Another possible cause is changing amounts of dust and gases in the air. More dust and fewer gases could have caused Earth's surface to cool.

Whatever its cause, the latest ice age left lasting marks on the land. The creeping ice carried gravel, sand, soil, clay, and even boulders. When the ice melted, these materials were left behind in ridges, piles, and other formations. Many lakes formed in places where the ice melted.

Iceberg

Only a small part of a giant iceberg shows above the surface of the ocean.

A huge chunk of ice floating in the ocean is called an iceberg. Many icebergs are the size of houses or large buildings. Most of their size, however, is hidden underwater. Icebergs can easily damage or destroy passing ships.

Icebergs come from glaciers, or large masses of slowly moving ice. In a process called calving, pieces of a glacier break off into the ocean. The pieces, or icebergs, can drift for thousands of miles. When they reach waters that are warm enough, they melt.

The largest icebergs ever seen were miles across and hundreds of feet high. Although icebergs are extremely heavy, they float for the same reason that an ice cube floats in a glass of water: ice is less dense, or lighter, than water.

Iceland

The island country of Iceland is a scenic land of volcanoes and glaciers. Though its closest neighbor is Greenland, it is a part of Europe. The capital is Reykjavík.

Geography

Iceland lies in the Atlantic Ocean just south of the Arctic Circle. About 200 volcanoes dot the island. Iceland is also known for its glaciers, or large sheets of ice. Winters are mild and windy, and summers are damp and cool.

Plants and Animals

Plant life covers only about one fourth of Iceland. Bogs, moors, and sparse grasslands are common. Animals include foxes and reindeer. Many fish, whales, and seals live in Iceland's waters.

People

Nearly all the people are Icelandic, mainly descendants of early settlers from Norway. The main language is Icelandic.

A volcano formed Crater Víti in Iceland.

Most people are Christians. Most of the people live in cities and towns along the coast.

Economy

Transportation, tourism, and technology are vital to the economy. Fishing is also important. Manufacturers make food products and aluminum. Farmers raise sheep and dairy cattle.

History

Iceland was one of the world's first independent, democratic republics. Its mainly Nordic settlers formed a legislature called the Althing in AD 930. Norway ruled Iceland from 1262 to 1380, when Denmark took over. Iceland regained independence in 1944. In 1980 Iceland elected Vigdís Finnbogadóttir as the world's first woman president.

Ice Skating

Ice skating is both a pleasant hobby and a competitive sport. Ice skaters glide across ice wearing skates—shoes or boots with metal blades attached to the bottom. People skate for fun both outdoors and indoors. They skate on all kinds of ice surfaces, from a small frozen pond to a large indoor arena.

Competitive skating consists of two sports: figure skating and speed skating. Both are events at the Winter Olympic Games. Figure skaters also perform in ice shows around the world. The team sport of ice hockey involves skating as well. Ice hockey is played in schools, in professional leagues, and at the Olympic Games.

Ice Skates

There are three basic types of ice skates: figure skates, speed skates, and hockey skates. Figure skates are the best type of skate for pleasure skating. A figure skate has a tall boot that extends above the ankle. The blade on a figure skate is about as long as the boot. Each skate has a toe pick, a jagged-toothed edge at the front of the blade. Figure skaters use toe picks to brace themselves when they leap into the air.

Speed skates are designed for racing. A speed skate has a long blade attached to a low-cut boot.

A hockey skate has a shorter blade that is curved at the ends. This design allows hockey players to make quick turns at high speed. A hockey boot is hardened

Hockey players, figure skaters, and speed skaters wear different types of skates.

to protect the player's foot. A stiff toe box in the front provides extra protection for the toes.

Figure Skating

Figure skating has been an Olympic event since 1908. That was before there were separate summer and winter Olympic Games. Figure skating has become one of the most popular sports in the Winter Games.

Figure skaters perform routines that involve jumps, spins, and dance moves. They perform the routines to music. Judges decide the winner in contests of figure skating. The skaters are judged on how well they do their routines. They are also judged on how artistic they are.

Figure skaters perform artistic routines on the ice.

Until the 1990s figure skaters were also judged on figures, or patterns, that they had to make with their skates on the ice. This was how figure skating got its name.

Figure skaters compete as individuals or in male and female pairs. Ice dancing is another event that features a man and a woman skating together. It became a separate Olympic event in 1976. Ice dancing is similar to ballroom dancing.

Speed skating is a type of ice skating. Speed skaters wear smooth, close-fitting clothing to cut air resistance at high speed.

Speed Skating

Speed skating and short-track speed skating are racing events. Speed skating has been an Olympic sport since 1924. Short-track races were first held at the 1992 Olympics. Speed skaters race two at a time around a track, but they do not race each other. Instead, after all the competitors have skated, the skater with fastest time wins. Short-track racers compete against each other. Several skaters race around a short track in a high-speed dash to the finish line. Teams of four compete in short-track relay races.

History

Ice skating probably started in northern Europe as early as 1000 BC. The first skates were made from the bones of elk, oxen, reindeer, and other animals. Skating became especially popular in the Netherlands, which has many artificial waterways called canals. In the winter skaters used the canals to get from place to place. Skating on frozen ponds was popular in England during the 1600s. The English later introduced skating to North America.

The first indoor skating building, called an ice rink, opened in London, England, in 1876. It had artificially frozen ice. Three years later the first indoor ice rink in the United States opened at Madison Square Garden in New York City. Indoor ice rinks provide a place for people to skate even during warm weather. They also host large ice shows featuring well-known skaters.

Idaho

Most of the U.S. state of Idaho lies in the highlands of the Rocky Mountains. The state is known for its natural beauty. In addition to towering mountains it features evergreen forests, high waterfalls, and steep canyons.

There has been much confusion surrounding the origin of the state's name. Many people now think that the name was made up by a politician. Idaho is nicknamed the Gem State. Its official gemstone is the Idaho Star Garnet. Boise is the capital.

Geography

Located in the northwestern United States, Idaho is bordered by six other

states. Montana and Wyoming lie to the east, Utah and Nevada to the south, and Oregon and Washington to the west. The Canadian province of British Columbia lies to the north.

The Rocky Mountains cover most of the northern half of the state. They also run along the state's southeastern border. In the southern part of the state a large plain covers the area around the Snake River. In the west the Snake River flows through Hells Canyon. It is the deepest gorge in the United States.

At 12,662 feet (3,859 meters), Borah Peak in the Rocky Mountains is the state's highest point. In general, Idaho's climate is mild. The mountain areas are cooler than the southern plains area. The mountains sometimes receive large amounts of snow.

People

The state was settled by people who moved from the eastern United States. Whites of European heritage still represent more than 90 percent of Idaho's population. Hispanic Americans make up more than 7 percent of the state's population.

Boise is the largest city in Idaho. Located in southwestern Idaho, it is the state's center of business and government. Nampa is a large city not far from Boise. The cities of Pocatello and Idaho Falls are located in southeastern Idaho.

Economy

Tourism is a major part of Idaho's economy. Sun Valley is one of the state's many winter skiing resorts. The Boise area is the site of high-technology firms. These companies manufacture computer parts and laser printers. Idaho's farms yield dairy products, cattle, potatoes, and wheat. Food processing is an important industry. Many of Idaho's famous potatoes are processed into french fries and then packaged for shipping.

History

Native Americans had lived in the area that is now Idaho for at least 10,000 years before white explorers arrived. In the early 1800s the largest Native American groups in the area were the Nez Percé and the Shoshone.

In 1805 explorers led by Meriwether Lewis and William Clark were the first white people to explore the region. For much of the early 1800s, fur trappers were the main visitors. In the 1830s a fur-trading company known as the Hudson's Bay Company built forts in Idaho. The forts became stopover points on the Oregon Trail, a famous wagon route to the Northwest.

The discovery of gold on Orofino Creek in northern Idaho in 1860 started a gold rush. The population increased sharply as many miners arrived. Soon silver and lead mining began in the mountains.

The Idaho Territory was established in 1863. At first the territory was larger

than Texas. It included the land that is now Idaho and Montana and all of Wyoming except the southwestern corner. Later in the 1860s Montana and Wyoming were separated from it, leaving Idaho with its present borders.

Idaho was admitted to the Union in 1890 as the 43rd state. Federal troops were called in during the new state's early years to help break up a series of mining strikes. Southern Idaho faced problems between Mormons and other religious groups.

During the 1900s Idaho developed its agriculture, forestry, and manufacturing industries. In the early 21st century one of the issues of concern to the state was how to protect the quality of its scenic land.

Idaho's Bitterroot Mountains attract hikers and others who enjoy the beautiful scenery. The Bitterroots are part of the Rocky Mountain range.

Iditarod

Dogs and a musher leave Anchorage at the start of the Iditarod race.

Every March the excitement of the Iditarod Trail Sled Dog Race grips Alaska. The race covers about 1,100 miles (1,770 kilometers) between the cities of Anchorage and Nome. Each sled is pulled by 12 to 16 dogs. The person driving the sled is called a musher.

The course length and route vary slightly from year to year. The race partially follows an old dogsled mail route. It crosses mountains and frozen rivers. Sled teams face cold temperatures and blowing snow. Champions have finished the race in less than 10 days. Most teams, however, take much more time than that.

Most mushers are from Alaska. The race also draws competitors from other states, Canada, and other countries. Men and women of all ages compete together. Susan Butcher and Rick Swenson are two of the most famous champions.

Sled dogs are chosen from breeds that do well in cold weather. Common

choices include Eskimo dogs, Siberian huskies, Samoyeds, and Alaskan Malamutes. Mushers train the dogs from puppyhood.

The Iditarod began in 1967 as a short race. It started as a way to celebrate the 100th anniversary of the U.S. purchase of Alaska. It developed into the current race in 1973.

Iguana

Iguanas are reptiles that belong to a large family of lizards. They are often seen sunning themselves on branches overhanging water. If disturbed, they plunge into the water.

Most species, or kinds, of iguana live in the Americas. The best-known kind is the common, or green, iguana. It is found from Mexico south to Brazil. Two

Two iguanas cling to branches.

kinds of iguana live on the Galápagos Islands. Most iguanas like dry habitats, but some live in rain forests.

Most iguanas are green. Many have unusual sawlike teeth. They also have a scaly back and a fold of skin under the neck. The male common iguana grows up to 6.5 feet (2 meters) long and weighs up to 13 pounds (6 kilograms). The female is about half that weight.

Iguanas eat leaves, fruits, insects, small mammals, and birds. The marine iguana of the Galápagos Islands eats seaweed.

Iguanas are not as common in the wild as they once were. People have built on land where iguanas once lived. They also hunt iguanas and capture them to sell as pets. In rural areas some people eat iguanas. Cats, large birds, and other animals also eat young iguanas and iguana eggs.

Iguanodon

The second dinosaur ever to be discovered was *Iguanodon*. The name *Iguan-*

odon means “iguana tooth.” Scientists chose this name because the teeth of *Iguanodon* looked very similar to the teeth of modern iguanas. Scientists determined that dinosaurs were reptiles after the discovery of *Iguanodon*.

When and Where *Iguanodon* Lived

Iguanodon lived about 159 to 99 million years ago. Remains of *Iguanodon* have been found in Europe, Africa, Australia, Asia, and North America.

Physical Features

Iguanodon reached a length of about 30 feet (9 meters) and stood up to 16 feet (5 meters) tall. It weighed between 4 and 5 tons. The most distinctive feature of *Iguanodon* was its front feet with five fingers. The feet were something like hands. The dinosaur’s back legs were long and sturdy. The teeth of *Iguanodon* were ridged inside its large cheek pouches. A bony beak at the end of its snout replaced the front teeth.

Behavior

Iguanodon was a plant eater. Most of the time *Iguanodon* ate from plants that grew along streams and rivers. To reach

At first scientists thought that *Iguanodon* rested on its hind legs with its tail on the ground. Now scientists think that it usually stood on all four legs.

leaves in trees, it stood up on its two back legs, balancing itself with its tail. The spiked thumb of *Iguanodon* remains a mystery to scientists. It may have been used to tear down plants, as a weapon for self-defense, or against rival males during the breeding season. Remains of *Iguanodon* have been found in groups, which suggests that they roamed prehistoric Earth in herds.

Dinosaur

Illinois

The Illinois were a group of small Native American tribes that shared the same territory, language, and way of life. The tribes included the Cahokia, the Kaskaskia, the Michigamea, the Peoria, and the Tamaroa.

These groups originally lived in a large part of what is now Illinois. They also lived in parts of what are now Wisconsin, Missouri, Iowa, and Arkansas.

The Illinois built their villages along rivers. Their bark-covered homes were large enough to house many families. The Illinois grew corn, beans, and squash. After the planting season they left their villages to hunt bison (buffalo) on the prairies. They returned in late summer to harvest their crops.

French explorers and traders came to their lands in the 1670s. The Illinois soon became trading partners of the French.

A member of the Peoria Tribe of Oklahoma poses for a photographer during the 1880s.

The Illinois began to decline soon after meeting the French. They suffered from diseases that the Europeans carried with them. The Illinois also fought with several neighboring tribes. In 1769 an Illinois killed Pontiac, a chief of the Ottawa people. This brought more attacks. The Illinois lost both land and people. In 1832 most of the remaining Illinois moved to what is now Kansas.

In the 1860s the U.S. government moved the Illinois from Kansas to a reservation in Indian Territory (now Oklahoma). They became known as the Peoria Tribe of Oklahoma. At the end of the 20th century there were about 1,400 Peoria living in the United States.

Native Americans • Pontiac

Illinois

The state of Illinois lies in the Midwestern heartland of the United States. It presents a striking contrast between city and small-town life. Illinois is generally thought of in two parts—Chicago and the rest of the state. Chicago is the country's third largest city. The city and its surrounding counties have a population of more than 8 million. Because Chicago is in the northern part of the state, the rest of the state is often referred to as Downstate. It consists of a mix of cities, farmland, and small towns. The Downstate population is about 4 million. Springfield is the state capital.

Illinois was named for the Illinois Indians. The state is popularly called the Land of Lincoln. Illinois was where Abraham Lincoln became a lawyer, entered politics, married, served as a congressman, and was nominated for the U.S. presidency in 1860.

Geography

Wisconsin borders Illinois on the north. To the west the Mississippi River separates Illinois from Iowa and Missouri. On the south the Ohio River forms the boundary with Kentucky. To the east is Indiana, with the Wabash River forming part of the boundary. The northeastern part of the state stretches along Lake Michigan for 63 miles (101 kilometers).

Illinois was called the Prairie State by its early explorers because of its vast grasslands. It is one of the most level states,

with an average elevation of about 600 feet (180 meters). Gradually sloping hills and shallow river valleys cover most of the state. The Ozark Mountains extend into Illinois from Missouri in the southwest corner. Another area of low plateaus enters Illinois from Indiana and Kentucky in the southeast. Illinois has warm summers and cold, sometimes snowy, winters.

People

Whites of European heritage make up the majority of the state's population. African Americans represent about 15 percent of Illinois's population. Hispanics make up 12 percent of the state's people.

The city of Chicago accounts for a large share of Illinois's population and economy.

Chicago is the leading metropolitan area of the Midwest. It is a center of finance, industry, and culture. Because of its location in the middle part of the country, it is also a center for air and rail travel. Several suburbs of Chicago, including Aurora, Naperville, and Joliet, are also among Illinois's largest cities. About one fifth of the state's people live in rural areas.

The main institutions of higher education are the University of Chicago; Northwestern University, in Evanston;

and the University of Illinois, with campuses in Urbana-Champaign, Chicago, and Springfield.

Economy

The economy of Illinois is diverse. The state is strong in finance, services, trade, manufacturing, government, transportation, and agriculture.

Illinois is a leading manufacturer of machinery. It also ranks among the top states in the manufacture of food products, fabricated metal products, and chemicals. The state is also a leader in printing, publishing, broadcasting, and telecommunications.

Illinois has ranked among the chief farming states since about 1850. The most valuable crops are corn and soybeans. More than one fifth of Illinois's farm production comes from the sale of livestock, especially hogs and cattle, and livestock products.

Cornfields and other farmland cover large areas of the state of Illinois. Corn and soybeans are the state's leading crops.

The Lincoln Home National Historic Site is located in Springfield, Illinois. It features the house that Abraham Lincoln lived in for 17 years before he became president of the United States.

History

Native American settlement in Illinois dates from about 8000 BC. Beginning in about AD 800 Indians known as the Mississippian people lived in the region. They left behind thousands of earth mounds that they had built up from the prairie. The largest of these is Monks Mound, in Cahokia in southwestern Illinois. A number of Native American peoples lived in the area when Europeans arrived.

The French explorers Louis Jolliet and Jacques Marquette entered the region in 1673. Illinois was controlled by the French until 1763, when it passed to the British. In 1778 George Rogers Clark claimed the region for the United States. The first settlement on the site of Chicago was made in 1779 by black pioneer Jean-Baptist-Point du Sable.

Illinois was officially given over to the United States in 1783, at the end of the American Revolution. It became the

21st state on December 3, 1818. Some 250,000 Illinoisans fought for the Union during the American Civil War.

In 1871 fire swept through Chicago, destroying a third of the city. However, the fire proved only a temporary setback in the city's rapid growth. Many people moved there to help rebuild the city. The workers were not always treated well. Soon they began to ask for better working conditions. By the end of the 1800s Illinois was a main focus of the labor movement. Chicago was the site of several violent confrontations between workers and police. The two most famous events were the Haymarket Square Riot of 1886 and the Pullman Strike of 1894. In spite of this, Chicago and the rest of Illinois underwent tremendous economic and cultural growth.

The two parts of the state did not always grow equally, however. The interests of the big city and the small towns were not always the same. This is reflected in the state's politics. Since the Civil War, the Republican and Democratic parties have competed for power in Illinois. Chicago is strongly Democratic. Much of the rest of the state is Republican. Most of Chicago's suburbs are Republican as well.

Immune System

Most living things try to protect themselves from harm. Animals have a special protection called the immune system. The immune system protects the body from substances called antigens. Some of the most harmful antigens are germs like viruses and bacteria, which cause illness. Parts of the immune system block antigens from entering the body. Other parts destroy the antigens that do enter.

The protection given by the immune system is called immunity. Humans and

Special cells that eat antigens are a part of natural immunity. B cells that release antibodies are a part of acquired immunity.

some animals have two basic types of immunity: natural and acquired.

Natural Immunity

All animals, including humans, have natural immunity. It works against any antigen that enters or tries to enter the body. Skin is a part of natural immunity. It blocks many things from entering the body. Mucus in the nose also blocks antigens. In addition, most animals produce special chemicals and cells that attack antigens inside the body.

Acquired Immunity

Only human beings and other animals with backbones have acquired immunity. With this kind of immunity, certain cells in the body can “remember” the types of antigens they have attacked in the past. This “memory” allows the acquired immune system to attack these antigens more strongly the next time they enter the body.

Certain white blood cells, called lymphocytes, are important parts of the acquired immune system. There are two different kinds of lymphocytes: B cells and T cells. B cells release products called antibodies, which attack antigens. T cells are divided into helper cells and killer cells. Helper T cells produce substances that help new lymphocytes grow. Killer T cells destroy cells in the body that are infected by antigens.

Because of acquired immunity, people get certain diseases, like chicken pox, only once. Acquired immunity is also what makes vaccines work.

Did You Know?

The spleen is part of the human immune system. It is a small organ that removes bacteria from the blood.

Problems with the Immune System

The two types of immunity normally work together to protect the body from harmful invaders. But sometimes the immune system does not work properly. It may spot and try to destroy cells that a doctor has put into the body on purpose. For example, the immune system may attack a healthy kidney that has been transplanted into a patient.

The immune system may also overreact to antigens that are not really harmful to the body. Allergies are an example of this type of problem. When some people breathe in pollen from plants or eat certain foods, the immune system attacks the pollen or food particles. The attack causes sneezing, itching, or other symptoms.

Another possible problem with the immune system is called an autoimmune response. This happens when lymphocytes see normal, healthy cells as antigens and attack them. Rheumatoid arthritis is an example of an autoimmune disease. In this disease, lymphocytes attack the joints between bones.

A serious disease of the immune system is AIDS, or acquired immunodeficiency syndrome. It is caused by a virus that attacks the immune system's helper T cells. As the T cells die, the immune system cannot protect the body from other dangerous infections.

AIDS • Allergy • Vaccine

Did You Know?

Fever, pain, redness, and swelling are signs that the immune system is fighting antigens.

Impeachment

Impeachment is a process by which a government official is charged with a crime. A legislature, or lawmaking body, handles an impeachment.

In the United States the two houses of Congress carry out impeachments. First, the House of Representatives impeaches, or brings charges against, an official. When the House impeaches an official, it does not mean that he or she is guilty of a crime. It means that there is evidence that the official may have committed a crime.

The Senate then holds a trial and acts as the judge. After hearing the evidence, the senators vote on whether the official is guilty or not guilty. Two thirds of the senators must vote guilty for the official to be convicted, or found guilty. If convicted, the official must leave his or her job.

The impeachment process is rarely used in the United States. The only U.S. presidents to be impeached were Andrew Johnson, in 1868, and Bill

When a U.S. government official is impeached the Senate holds a trial to decide if the official is guilty.

Clinton, in 1998. The Senate found both of them not guilty.

In the United Kingdom the two houses of Parliament handle impeachments. The House of Commons impeaches an official, and the House of Lords serves as the judge. Impeachment was once fairly common in England. However, there have been no impeachments in the United Kingdom since 1806.

► see Empire.

Inca

The Inca people once ruled a vast empire in the Andes Mountains of South America. Their capital was Cuzco, in what is now Peru. The Inca Empire included about 12 million people at its peak in the early 1500s.

How the Inca Lived

The Inca grew such crops as corn, squash, tomatoes, peanuts, and cotton. Inca farmers were the first to grow potatoes. They also raised guinea pigs, ducks, alpacas, and dogs. The Inca rode animals called llamas and also used them as work animals.

The Inca made clothing from llama wool and cotton. They made pottery

The remains of an Incan fortress stand on a hilltop near Cuzco, Peru.

and musical instruments. They also made things out of metal.

The Inca built their houses using stone or adobe (sun-baked clay). The ruins of the Inca city of Machu Picchu are famous for their well-made buildings.

The Inca spoke a language called Quechua. They had no form of writing. However, they kept records using a complicated system of colored knotted cords called quipus.

History

According to the traditional belief of the Inca, they originally came from a village called Paqari-tampu. In the 1100s they moved north and settled in Cuzco. In the early 1400s the Inca began to attack neighboring peoples and take control of their lands. Within 100 years the Inca Empire was at the height of its power.

The Spanish began to explore Peru in the 1520s. By 1533 Spanish soldiers led by Francisco Pizarro had captured Cuzco. They brought the Inca Empire

under Spanish control. Today the descendants of the Inca live in the Andes Mountains. They make up almost half of Peru's population.

Independence Day

Many countries celebrate the day that they became independent. In the United States that day is the Fourth of July, which is also called Independence Day. Independence Day marks the birth of the United States as a new country. On July 4, 1776, the leaders of the new country signed the Declaration of Independence.

How Independence Day Is Celebrated

Everywhere in the United States, Independence Day is an all-day celebration. Many people have the day off from work. They spend time with family and

friends. They attend picnics, barbecues, and parades during the day. At night many Americans gather to watch fireworks. Some also go to concerts where patriotic music is played.

Some people wear red, white, and blue clothes on July 4. Many people hang U.S. flags outside their homes.

History

In the 1700s Great Britain ruled the 13 American colonies that would become the United States. Many American colonists were unhappy with the British government. The colonists did not want to pay taxes unless they had a say in the government. They protested against what they called "taxation without representation."

In 1775 the colonists began to fight for their freedom from Great Britain. In June 1776 Thomas Jefferson wrote the first draft of the Declaration of Independence. He gave it to the members of the Continental Congress, who made a few changes. The members then signed the new version on July 4, 1776.

The first Independence Day celebrations included parades and political speeches. By the late 1800s people were celebrating the holiday in the same ways that Americans do today. Independence Day is now a major summer holiday.

India

More people live in India than in any other country in the world except China. India's culture is one of the oldest and richest in the world. The capital is New Delhi.

Geography

Much of India's territory is a peninsula that extends into the Indian Ocean. To the west of the peninsula is the Arabian Sea, and to the east is the Bay of Bengal. India shares borders with Pakistan, China, Nepal, Bhutan, Bangladesh, and Myanmar.

The high Himalayas rise in the north. South of the mountains is a plain of soil left behind by the Indus, Ganges, and Brahmaputra rivers. The Indus River gave the country its name. The Ganges is sacred to followers of Hinduism. In the northwest is the Thar Desert. Most of the south is fairly flat. Along the coasts are low mountains called the Western and Eastern Ghats.

India's climate is controlled by monsoons, or winds that change direction each season. Most of the country has three seasons: a hot, dry spring; a hot, wet summer; and a cool, dry winter.

Plants and Animals

Tropical evergreen forests grow in rainy areas. In less rainy regions trees lose their leaves during the cool, dry season. Dry regions have thorny shrubs and grasses. Some 100 types of palm tree also grow in the country.

India's wildlife includes tigers, lions, leopards, elephants, rhinoceroses, bears, and deer. Monkeys and cows are common even in cities. The peacock is the national bird. The best-known reptile is the cobra.

People

India has a mixture of peoples who have blended together since ancient times. They speak many languages, including Hindi, Bengali, Telugu, Marathi, Tamil, Urdu, Gujarati, Kannada, Malayalam, Oriya, Punjabi, and Assamese. Many Indians speak Hindi or English as a second language. About three fourths of Indians are Hindus. Muslims form the next-largest religious group. Others follow Christianity, Sikhism, Buddhism, Jainism, or other religions.

Most Indians live in villages. Indian cities are generally very crowded.

The Clock Tower and the Golden Temple in Amritsar, India, are important buildings of the Sikh religion.

Indians are divided into social groups known as castes. People are born into these groups, each of which has its own traditional occupations, diet, and customs.

Economy

Services—including computer work, communications, transportation, and tourism—are India's most valuable economic activities. Industry is also important. Factories produce textiles, chemicals, processed foods, iron and steel, electronics, automobiles, and cement. Mining provides coal, oil, iron ore, and limestone.

Agriculture employs the most Indian workers. Crops include grains, sugarcane, fruits, beans, cotton, jute, tea, coffee, rubber, and spices. India raises more cattle and water buffalo than any other country in the world. Because cows are holy to Hindus, Indians often use cattle as work animals instead of killing them for their meat.

History

India's history goes back to ancient times. By about 2500 BC the Indus Valley civilization had extended from what is now Pakistan into northwestern India. Between 1500 and 1200 BC tribes of people known as Aryans invaded northwestern India and spread eastward.

The Mauryan Empire, which lasted from about 321 to 185 BC, united most of what is now India. The Hindu Gupta Dynasty ruled from about AD 320 to 540. The Guptas encouraged literature, music, drama, painting, and sculpture.

Muslim Rule

Muslims began invading India in the 700s. In 1206 they set up a sultanate, or kingdom, centered in Delhi. The greatest of all the Muslim states in India was the Mughal Empire, which defeated the Delhi sultanate in 1526. By the late 1600s it had spread over almost all of India.

British Rule

Meanwhile, in 1498 the Portuguese navigator Vasco da Gama sailed to India. The Dutch, the British, and the French soon challenged Portugal for trade with India. By 1849 Great Britain's East India Company ruled almost all of India. After a rebellion by Indian soldiers, the government of Britain took direct control of India in 1858.

British rule brought peace and some economic growth. However, many Indians wanted their own government. In 1885 some of the people formed a political party called the Indian National

Indian women celebrate Pongal, a Hindu festival. During Pongal people offer rice boiled in milk to the gods.

Congress. In 1920 Mahatma Gandhi, a leader of the Congress party, began urging Indians to resist British rule. He asked them to protest British laws peacefully, not violently.

Independence

India won full independence in 1947. However, some of its land was set aside

to create the Muslim country of Pakistan. Fighting soon broke out between India and Pakistan. After a war in 1971, East Pakistan became the new country of Bangladesh. India and Pakistan continued to fight over the territory called Kashmir into the 21st century.

Within India, ethnic and religious conflicts led to the assassinations of two prime ministers, Indira Gandhi in 1984 and her son Rajiv in 1991. India also faced a growing population and widespread poverty. Despite those problems, the country maintained a democratic government. It also developed nuclear technology and a strong computer industry. In 2004 Manmohan Singh became the first Sikh to serve as India’s prime minister.

Indiana

The U.S. state of Indiana calls itself the Crossroads of America

because it sits in the heart of the Midwest. Indiana's people are often called Hoosiers, though it is unclear where the name came from. Indiana took its name from the word Indian; with the addition of the letter *a*, it means "Indian land." The state capital is Indianapolis.

Geography

Indiana borders Lake Michigan and the state of Michigan on the north, Ohio on the east, Kentucky on the south, and Illinois on the west. The Ohio River forms the southern border, and the Wabash River forms part of the western border.

The landscape of Indiana is generally flat. The northern third has a gently rolling landscape. In the northwest, windblown sand dunes rise along Lake Michigan. A larger plains area in the middle of the state has rich soil, making it great for farming. The land changes along the Ohio River in the south-central and southwestern parts of the state. This region has many sharp ridges, rounded hills, and deep valleys. Indiana has warm summers and cool winters. Northern cities along Lake Michigan receive much heavier snowfall than other parts of the state.

People

The majority of Indiana's residents are white, native-born Americans. Most trace their ancestry back to England, Scotland, Ireland, and Germany. African Americans are the largest minority group, making up more than 8 percent of the population. Five of Indiana's cities have populations of more than 100,000.

Indianapolis is the largest city in Indiana. It is located near the center of the state. Other large cities are Fort Wayne, Evansville, South Bend, and Gary. The state's institutions of higher education include Indiana University, with its main campus at Bloomington, and Purdue University, with its main campus at West Lafayette. The University of Notre Dame, near South Bend, is a well-known Roman Catholic university.

Colorful fall foliage attracts visitors to Brown County State Park in Nashville, Indiana.

Economy

Indiana is among the nation's top manufacturing states. The main products include motor vehicles and parts, engines, steel, electronic equipment, chemicals, and musical instruments. Other important areas of the economy are finance, government operations, and service-oriented businesses. Indiana's farms yield corn, soybeans, hogs, and dairy products.

History

The first people to live in the area were prehistoric Native Americans. Archaeologists have found remains of these people at Angel Mounds, a site in southwestern Indiana. The major tribes living in the region when Europeans arrived included the Miami, the Potawatomi, and the Delaware (or Lenni Lenape).

In 1679 the French explorer Sieur de La Salle became the first European to enter

the area. France later claimed the region but in 1763 turned over the territory to Great Britain. The United States acquired the land at the close of the American Revolution in 1783.

Fear of Indian attacks kept settlers from the region for many years. After the Indiana Territory was created in 1800, its first governor, William Henry Harrison, did much to open the land for settlement. In 1811 he defeated a group of Indians at the battle of Tippecanoe. Indiana became a state in 1816. Industry began to grow in the state during the Civil War. In the 1900s manufacturing became more important to the economy than agriculture. In the early 21st century, it continued to lead Indiana's economy.

Indianapolis is the capital of the U.S. state of Indiana. The city lies on the White River. It is famous for hosting a yearly sports event—the Indianapolis 500 car race. The race brings thousands of visitors to the city each May.

Indianapolis is a center of road, rail, and air transportation. Farmers from the area sell grain in the city. It is also a center of business, banking, and industry. Factories in Indianapolis make medicines, machinery, cars, telephones, and other products. There are also several universities.

In 1820 the government of Indiana chose a site in the center of the state to be the new capital. Indianapolis was built there. It became the official state capital in 1825.

A racetrack called the Indianapolis Motor Speedway was built in the early 1900s. The first Indianapolis 500 race was held there in 1911. Today the city is also home to professional basketball and football teams.

The Children's Museum of Indianapolis opened in 1925. It has become the largest museum for children in the world.

Indiana

Indian Ocean

Long before the larger Atlantic and Pacific oceans had been well explored, the Indian Ocean was a bustling region of travel and trade. More than 2,000 years ago, traders sailed the ocean to exchange goods between India, Africa, and Arabia.

Physical Features

The Indian Ocean is surrounded by four continents: Asia to the north, Antarctica to the south, Africa to the west, and Australia to the east. The Indian Ocean is the third largest of Earth's oceans. Its total area measures about 28,360,000 square miles (73,440,000 square kilometers).

The largest island in the Indian Ocean is Madagascar, which lies off the east coast of Africa. Madagascar and some of the

other islands in the ocean were once attached to a continent. Volcanoes formed other islands, including Sumatra (a part of Indonesia). Some of the ocean's islands, such as those in Maldives, are coral atolls. These are ribbons of coral reef that formed around the tops of underwater volcanoes.

Climate

Much of the Indian Ocean lies within the tropical and temperate zones. Temperatures are mild to hot. Winds called monsoons also affect the climate. Monsoons change direction according to the season. From October through April the winter monsoon blows from the northeast. It brings rain to Indonesia and Australia. From May to September the summer monsoon blows from the southwest. It brings rain to South Asia.

Destructive storms known as cyclones often form over the Indian Ocean. Cyclones generally move toward shore in a westward direction.

Economy

The Indian Ocean has played a significant role in shipping and trade for many years. The strong monsoon winds made ancient trade routes possible. The northeast monsoon carried traders from India and China to Arabia and Africa. The southwest monsoon carried traders in the opposite direction. The Indians and Chinese exchanged spices, silk, and gemstones for coffee, ivory, salt, and gold from Arabs and Africans.

Trade along the shipping lanes of the ocean continues today. Petroleum, or

Fishing boats dot a bay off an Indonesian island in the Indian Ocean.

oil, and oil products now make up much of the trade. The ocean contains valuable reserves of oil. It also provides shrimp, fish, and other seafood to countries.

Exploration

Sailors from India, Egypt, and Phoenicia (in the Middle East) were the first to explore the Indian Ocean. They did this between 3000 and 1000 BC. Europeans did not begin to explore the ocean until the 1500s. The Spanish first crossed the ocean from east to west in 1521. Captain James Cook of Great Britain explored the southern waters of the Indian Ocean in 1772.

Environmental Issues

Waste from factories and cities has polluted the Indian Ocean. In addition, there is concern about the amount of oil being transported in ships on the ocean. Oil spills have harmed fish and other animals.

Indonesia

The country of Indonesia is made up of about 13,670 islands. It is the largest country, both in area and in population, in Southeast Asia. The capital is Jakarta.

Geography

Indonesia's islands lie along the equator between the Indian and Pacific oceans. Five of the islands make up more than 90 percent of the land area. These are Sumatra; Java; Sulawesi; southern Borneo, known as Kalimantan; and western New Guinea, known as Papua.

Most of the islands are mountainous. Indonesia has many active volcanoes. The area is also known for earthquakes. Indonesia's climate is hot and humid.

Plants and Animals

Tropical rain forests cover much of Indonesia. Swamps with mangrove trees

are found in coastal lowlands. Indonesia's wildlife includes rhinoceroses, orangutans, tapirs, tigers, and elephants. A giant lizard, the Komodo dragon, lives on a few small islands. The Komodo dragon can be more than 10 feet (3 meters) long. Among Indonesia's birds are cockatoos, bowerbirds, and birds of paradise. Peacocks live on the island of Java.

People

Indonesia has more than 300 different ethnic groups. Most of the groups have East Asian roots. The largest group is the Javanese, who live mainly on Java. On the eastern islands most of the people are related to the Melanesians of Oceania. Chinese people form a small but important group. About 250 languages are spoken, but Indonesian (also called Bahasa Indonesia) is the main language.

A boy carries jackfruit on a pole across his shoulders in Sumatra, Indonesia.

Most of the population practices Islam. Other religions include Christianity, Hinduism, Buddhism, and traditional beliefs. Most people live in rural areas, but the cities are growing. More than half of Indonesia's population lives on Java.

Economy

Industry is a major part of Indonesia's economy. Manufactured products include machinery, chemicals, clothing, electronics, and wood products. Indonesia also produces oil and natural gas. Its mines provide bauxite (from which aluminum is made), copper, nickel, silver, and gold.

Agriculture employs about 40 percent of the workforce. The staple crop is rice. Indonesia is also a major supplier of natural rubber, made from rubber trees. Other cash crops include palm oil, sugarcane, coffee, and coconuts. Goats, cattle, and sheep are raised. The waters surrounding Indonesia allow for a fishing industry.

History

The ancestors of modern Indonesians migrated to the islands from mainland Asia thousands of years ago. From the 600s to the 1500s Buddhist and Hindu kingdoms existed in Indonesia. In the 1200s Muslim traders from India brought Islam to Sumatra. The religion spread to the other islands, except for Bali, which remained Hindu.

Dutch Rule

The Portuguese arrived in Indonesia in the early 1500s. The Dutch (people from The Netherlands) and the English followed. By the late 1600s the Dutch controlled almost all the islands. They lost control of Indonesia in 1942, when the Japanese invaded during World War II. After the Japanese surrendered in 1945, The Netherlands tried to regain control. In 1949, however, the Dutch granted Indonesia independence.

Independence

In 1965 Indonesia's first president, Sukarno, was overthrown. General Suharto came to power. Widespread protests forced him to resign in 1998. Indonesia held free elections in 1999. Later presidents faced the problems of terrorism and rebellion in parts of Indonesia.

In late 2004 one of the largest earthquakes ever recorded struck off the northwestern coast of Sumatra. It caused a giant wave, called a tsunami, that killed more than 200,000 people.

Indus River

One of the great rivers of the world, the Indus has long been a vital feature of the land now covered by India and Pakistan. The Indus Valley was the site of one of the world's earliest civilizations. The hymns of ancient India speak of the river, which is the source of the country's name.

The Indus River is about 1,800 miles (2,900 kilometers) long. It starts high in the Himalayas in the Tibet region of China. For about 500 miles (800 kilometers) the Indus flows through some of the world's tallest mountains. It passes through northwestern India, the territory of Kashmir, and northern Pakistan. Much of the river's water comes from the melting of glaciers and snow in the mountains.

After leaving the mountains the Indus flows onto the plains of Pakistan. In the region called Punjab, several rivers empty into the Indus and make it much wider. The Indus empties into the Arabian Sea.

Did You Know?

In 1960 India and Pakistan signed a treaty in which they agreed to share the waters of the Indus.

When snow melts from the mountains or rain falls on the land, the Indus River rises. Flooding happens when the river overflows its banks.

The Indus is very important to the economy of the region through which it flows. Although much of the land is very dry, farming is possible because river water is used for irrigation. The main crops grown in the region are sugarcane, wheat, rice, and cotton. Fish caught in the river include hilsa and trout. The shallow area where the river empties into the sea has a lot of shrimp.

Industrial Revolution

The Industrial Revolution was a period of major changes in the way products are made. It took place more than 200 years ago and greatly affected the way people lived as well as the way they

worked. In earlier days, people made products by hand. They worked mostly in their own homes or in small workshops. During the Industrial Revolution, many factories were built. Laborers began making large numbers of things using machines powered by engines.

England was the first country in which these changes took place. However, the Industrial Revolution soon spread to other European countries, the United States, and Japan.

Developments

The Industrial Revolution began in the cloth industry. Before that time making cloth was a slow process. After the wool was gathered it had to be spun into yarn and then woven into fabric by hand. In 1733 an invention called a flying shuttle made it easier to weave cloth. A machine called a spinning jenny, invented in 1770, made it easier to spin yarn. In 1793 Eli Whitney invented a machine called a cotton gin. It helped clean cotton after it was picked.

Whitney also came up with the idea of interchangeable parts. Before that time a worker who was skilled at making one type of product would spend a great deal of time making a single product by hand. Whitney discovered that a machine could make many copies of the individual parts of a product at once; the parts could then be assembled by any worker. This meant that many goods could be produced quickly. Soon factories were set up to produce these goods.

Before the Industrial Revolution people made clothing and other products at home. To make cloth they had to spin wool into yarn on a spinning wheel and then weave the yarn into cloth by hand.

Factories and the machines in them needed power sources. In the early 1700s people discovered how to build steam engines. In the late 1700s James Watt invented a steam engine that could run factory machines.

The Industrial Revolution soon spread to all kinds of production. Farmers, for instance, began to invent new machines to plow fields and plant crops.

Factory owners needed ways to bring large amounts of raw materials to their factories. They also needed ways to deliver the products that they made to customers in many places. Their demands led to many improvements in the transportation system. The U.S. inventor Robert Fulton perfected the steamboat in 1807. The British inventor George Stephenson put a steam engine on wheels and put the wheels on rails in 1825. The result was a railroad.

During the Industrial Revolution people invented looms that ran on steam or other power sources. These power looms wove cloth faster than ever before.

Impact on Society

By the late 1700s, many people could no longer earn their living in the countryside. People moved from farms and villages into bigger towns and cities to find work. Cities grew larger, but they were often dirty, crowded, and unhealthy.

Although the machines made the work easier in some ways, factory work created many problems for the workers. Machines increased production. This meant that products were cheaper to make and also cheaper to buy. Factory owners grew rich. Factory employees, however, did not earn much, and the work was often dangerous. Many worked 12 to 14 hours a day. Men, women, and even small children worked in factories.

Workers sought to win improved conditions and wages through labor unions. These organizations helped create laws

that protected the workers. They limited the number of hours they had to work and guaranteed that they would be paid a certain amount.

Industry • Technology and Invention

Industry

An industry is a group of businesses that make or sell similar products or perform similar services. Farms are part of the agricultural industry. Factories are part of manufacturing industries. Schools are part of the educational services industry. Industries are important to every country's economy.

The first human industry was agriculture. Most developing countries still depend on agriculture as their main industry.

Another early industry was mining, or the removal of metals and other materials from the earth. Since prehistoric

Manufacturing plants produce many different kinds of products, including foods and beverages.

times humans have mined metals to make tools and other goods.

Manufacturing industries make goods from the raw materials produced by agriculture and mining. Manufacturers make such everyday items as clothing, cars, computers, paper, and processed food. Another manufacturing industry is construction. Construction workers build houses, office buildings, roads, bridges, and sewers.

Service industries dominate the economies of developed countries. Workers in service industries do not provide actual goods. Instead they perform actions. Teachers, car mechanics, barbers, house-painters, bankers, and actors are all in service industries. One of the most important service industries is telecommunications. By connecting telephones and computers, telecommunications allows people to talk across great distances.

Indus Valley Civilization

One of the first civilizations in the world developed in the valley of the Indus River in Asia. It occupied both sides of what is now the border between Pakistan and India. The Indus Valley civilization lasted from about 2500 BC to about 1700 BC.

Society and Culture

The biggest cities of the Indus Valley civilization were Harappa and Mohenjo-daro. Both were in what is now Pakistan. Harappa might have had as many as 35,000 people. Mohenjo-daro was even larger. There were also at least 60 smaller settlements along the Indus River and the Arabian Sea.

Farming was important to the Indus Valley civilization. People ran water channels from rivers to the fields. The Indus people were among the first to grow cotton and use it to make cloth. They also might have been the first people to raise chickens.

Indus merchants used carved stones called seals to mark their goods. Many seals show pictures of animals and a form of writing. These seals have been found in Mesopotamia (in what is now

The people of the Indus Valley carved many objects, including mazes and dice.

A seal often had animal pictures and writing carved into it.

Iraq). This means that the two regions might have traded with each other.

History

Beginning in about 5000 BC, farmers near what is now Iran began to gather in villages. In about 3500 BC settlers began to move eastward into the Indus Valley. By about 2500 BC the Indus Valley civilization had developed at Harappa and other sites. Scholars do not know much about Indus Valley history because they do not understand the writing system.

The Indus Valley civilization probably broke down in stages between 2000 BC and 1700 BC. Some historians blame invaders from the west, probably a group known as Aryans. Climate change, floods, and diseases also might have hurt the civilization.

Civilization • Indus River

Influenza

Influenza, or flu, is a common illness of the respiratory, or breathing, system. Germs called viruses cause influenza. The viruses invade the nose, throat, and lungs.

The signs of influenza come on suddenly. They include body aches, chills, and fever. The person also may cough and sneeze and have a sore throat.

People with influenza often become very tired. Some may have a headache. After three or four days most people start to get better. But flu can be a serious danger to people who are very old or very young or have other health problems. Such people can get pneumonia and bronchitis.

Influenza viruses come in many types. The most dangerous types can kill even young and healthy people. Luckily, they do not cause outbreaks very often. But in 1918–19 an outbreak of influenza

Temporary hospitals took in many influenza patients during the 1918–19 outbreak.

killed more than 20 million people throughout the world.

People with influenza should get plenty of rest and drink lots of fluids. In the late 20th century scientists developed medicines to treat influenza.

People can protect themselves from influenza viruses by getting a shot of a substance called a vaccine. Because the viruses change constantly, a person must get a vaccination every year to stay protected.

Inquisition

In the 1200s the Roman Catholic church set up a court called the Inquisition. The Inquisition examined people accused of heresy, or going against church teachings.

The officials in charge of the Inquisition were called inquisitors. Inquisitors first gave an accused person a chance to confess. Some inquisitors tortured people to get them to confess. Even innocent people often confessed under torture.

People who did not confess received trials. Then inquisitors announced punishments for the guilty in a big ceremony. Punishments included fines, prison, or death.

Pope Gregory IX started the Inquisition in 1231. The Inquisition operated in

A painting shows inquisitors questioning a man. Inquisitors punished people who went against the teachings of the Roman Catholic church.

several countries. It was particularly harsh in Spain in the late 1400s, under King Ferdinand and Queen Isabella. A Spanish inquisitor named Tomás de Torquemada burned about 2,000 people at the stake. Torquemada also persuaded Ferdinand and Isabella to force more than 160,000 Jews out of Spain.

The Inquisition had some famous victims. One of them was the French heroine Joan of Arc. She was burned at the stake in 1431 partly because she claimed that she had received messages directly from God. Another was the Italian scientist Galileo. In the early 1600s he was punished for teaching that Earth revolves around the sun. Galileo was not put in prison, but he was not allowed to travel freely outside his house either. The Inquisition continued in a milder form until 1908.

Insect

The insects are the largest group of animals. In fact, about 75 percent of all animals are insects. Insects developed on Earth long before humans did. Today there are about 1 million known species, or types, of insect. And scientists are constantly discovering new species. Butterflies, beetles, ants, flies, grasshoppers, silverfish, and bees are all insects.

Where Insects Live

Insects live all over the world. They can survive in almost any place where food is available. For instance, insects can be found in cold regions, hot rain forests, deserts, mountains, caves, and freshwater. A few kinds even live in salt water.

Physical Features

Insects are members of a larger group called the arthropods. This group also includes spiders, ticks, centipedes, lobsters, and crabs. Like all arthropods, insects have a body that is divided into segments, or sections. They also lack a skeleton inside the body. Instead, insects

Honeybees are well-known insects. They build honeycombs to store their honey.

The body of an insect has three main segments: the head, the thorax, and the abdomen. The legs and the wings are connected to the thorax.

and other arthropods have a covering on the outside of the body called an exoskeleton. This exoskeleton protects the insect's body.

Unlike other arthropods, insects have three major body segments. Insects also have six legs. This is one way that insects differ from spiders, which have eight legs. Insects also have at least one pair of antennae, or feelers.

The three major segments of an insect body are the head, the thorax, and the abdomen. The head contains the insect's antennae, mouthparts, and eyes. The adults of many species have two kinds of eyes, simple and compound. Compound eyes have many lenslike parts. Each of these receives a separate image. The images are combined into a single picture in the insect's brain.

The thorax has three pairs of legs and usually two pairs of wings. But some insects have only one pair of wings or no wings at all.

The abdomen is made up of as many as 11 segments. It contains organs that digest food, push out wastes, and help the insect reproduce.

Insects vary greatly in size. Most insects are small, usually less than 0.2 inch (6 millimeters) long. However, some insects called walkingsticks can grow to more than 12 inches (30 centimeters) in length.

Behavior

Insects have a variety of ways to protect themselves from their enemies. For example, some insects hide by blending in to their surroundings. Many moths have a similar coloring to the bark of the trees on which they rest. Beetles have a very hard body armor to protect them. Some insects bite or sting their enemies. Some kinds produce poison.

Some kinds of insects live alone, while others live in groups. Termites, ants, and some bees and wasps live in very organized groups. Each individual has a particular job to do for the group. For example, some termites are born to be soldiers or workers. Other termites will be the king and queen.

Insects eat a great variety of plants, animals, and other living things. Certain insects, such as fleas and lice, live on the body of another animal. They get all their food from that animal's body. Such insects are called parasites.

Life Cycle

Most insects hatch from eggs. A few kinds are born live. An insect's exoskel-

As an insect grows, it sheds its exoskeleton from time to time. The insect then forms a new, larger exoskeleton.

eton cannot grow. Instead, as the insect grows, this covering splits apart and falls off from time to time. The insect grows a new covering. This process is called molting.

There are two basic life cycles found in insects. Some insects are born in nearly the same form they will have as an adult. The insect grows and molts, eventually becoming an adult. Grasshoppers and cockroaches go through this kind of growth process.

Other types undergo a complete change, or metamorphosis. After they hatch, they begin life in a form called a larva. It is completely unlike the adult form. For instance, a larva may look more like a worm than an insect. The larva eats a great deal and molts several times. It then enters a resting stage in a form

Did You Know?

Scientists who study insects are called entomologists.

called a pupa. The pupa's body changes greatly during this stage. It develops all of the features of the adult, including wings and legs. When this stage is complete, the adult emerges from the pupa. Bees, butterflies, and moths are some insects that develop this way.

Helpful and Harmful Insects

Many insects are helpful to humans and other animals. Some kinds eat other insects that are pests. Insects are also food for other animals. Some insects produce valuable products such as honey, silk, and dyes.

Many flowering plants depend on insects such as bees to help them reproduce. As insects feed on flowers, they spread a substance called pollen from the male parts of flowers to the female parts. This allows the female parts to make seeds.

Insects can also be pests. Some insects sting or bite people or other animals. Many insects can spread diseases to people, other animals, and plants. And some harmful insects eat crops, wood, clothing, and carpet.

Internal-Combustion Engine

Engines powered by internal combustion run cars, airplanes, lawn mowers, and other machines. Combustion means “burning.” Fuel, usually gasoline, burns inside an internal-combustion engine to make it work. Compared to earlier steam engines, internal-combustion

Four-Stroke Cycle

An internal-combustion engine goes through four strokes: intake, compression, combustion (power), and exhaust. As the piston moves during each stroke, it turns the crankshaft.

engines are lighter and more powerful. They made automobiles possible.

How Internal-Combustion Engines Work

In many internal-combustion engines a moving part called a piston slides up and down in a cylinder. Most car engines have four to eight cylinders. Valves at the top of a cylinder let in fuel and air and allow burned fuel to escape. Also at the top of the cylinder is a spark plug. The spark plug ignites, or sets fire to, the fuel.

As the engine runs, it goes through a cycle of four strokes: intake, compression, combustion, and exhaust. During the intake stroke, a valve opens and the cylinder fills with fresh fuel and air. Next, during the compression stroke, the piston moves toward the top of the cylinder. The piston creates pressure by squeezing the fuel and air into a smaller and smaller space with both valves closed. When the piston can go no higher, a spark from the spark plug ignites the fuel. Then, in the combustion stroke (also called the power stroke), an explosion of burning fuel forces the piston back down. During the exhaust stroke, a second valve opens and the piston rises up. It pushes the hot gases from the burned fuel out of the cylinder.

The piston is connected to an engine part called the crankshaft, which is outside of the cylinder. As the piston moves, it turns the crankshaft. The crankshaft is connected to other parts that run the machine.

Other types of internal-combustion engines are two-stroke, diesel, rotary, and turbine. Two-stroke engines go through two strokes instead of four. In diesel engines hot air, not a spark, causes the fuel to burn. Rotary engines have a spinning part instead of a piston. Turbine engines, used in jet airplanes, continually pull air into the front of the engine. The exhaust leaves out the back of the engine.

Although internal-combustion engines are powerful, most of the energy from the burning fuel is lost as heat. The engines must be cooled by water or air so they do not overheat.

History

In 1860 the French inventor Étienne Lenoir built the first internal-combustion engine, which he used in a car. In 1876 the German engineer Nikolaus Otto built a four-stroke engine. Otto's invention was the first successful internal-combustion engine. Rudolf Diesel, another German engineer, developed the diesel engine in about 1890.

Internet

The Internet is a network, or system, that connects millions of computers worldwide. It was one of the greatest inventions of the 1900s. Today the Internet helps many people communicate, work, learn, and have fun.

Did You Know?

Two-stroke engines are popular for lawn mowers and small motorcycle engines.

In the 1960s the U.S. government, businesses, and colleges worked together to make a system that would let computers across the United States share information. They created an early form of the Internet called ARPANET in 1969. In 1971 electronic mail, or e-mail, was invented as a way to send a message from one computer to another.

By the mid-1970s many groups of computers were connected in networks. Machines called routers were invented to connect the networks. This is how the original ARPANET eventually grew into the Internet.

In 1989 hypertext was invented. Hypertext is a link between different parts of an electronic document or between different documents. Hypertext became the basis of the World Wide Web, or “the Web,” which was created in the early 1990s.

Information on the Web is arranged in sites or pages. People view Web sites

A family uses a computer with a camera attached to it. The camera can take pictures that can be sent over the Internet to other family and friends far away.

using computer programs called Internet browsers. People create Web sites using a code called hypertext markup language, or HTML. Browsers read HTML and allow people to view Web sites on the computer. Each Web site has its own Internet address, called a uniform resource locator, or URL.

Since its beginnings, the Internet has changed to keep up with the demands of its users. Advances in technology make using the Internet quicker and easier. And as more and more people use the Internet, the quantity of information grows.

Intestines

Intestines are organs, or body parts, that are shaped like long tubes. They help break down food so that the body can use it for energy. This is part of the process called digestion. The intestines also remove wastes from the body. Mammals, birds, reptiles, amphibians, and fish have intestines.

A human's intestines fill much of the middle part of the body below the rib cage. The intestines are divided into two main sections, the small intestine and the large intestine. The small intestine is 22 to 25 feet (6.7 to 7.6 meters) long and coils like a maze. The large intestine is 5 to 6 feet (1.5 to 2 meters) long. The intestines have a special kind of muscle that squeezes and relaxes in a wavelike

In humans, the small intestine is longer and narrower than the large intestine.

motion. This motion pushes food and waste through the intestines.

The Small Intestine

Food enters the small intestine after it leaves the stomach. At this time the food is in the form of a thick liquid. Digestive juices from other organs, including the pancreas and the liver, enter the small intestine. They work with juices from the small intestine to break down the food into simple chemical substances. These substances then pass into the bloodstream through the walls of the small intestine. This process takes three to six hours.

The Large Intestine

Any food material that cannot be used by the body passes from the small intestine into the large intestine. The large intestine takes water and some minerals from this leftover food material. Tiny

living things called bacteria in the large intestine help to turn the food material into feces, or solid waste. The feces are stored in the large intestine until they pass from the body. The work of the large intestine takes between 10 and 20 hours.

Invertebrate

An invertebrate is an animal without a backbone. (An animal with a backbone is called a vertebrate.) Invertebrates live in every part of the world. In fact, most of the animals on Earth are invertebrates.

Invertebrates come in all different shapes and sizes. Some are so tiny that they can be seen only through a microscope. But the giant squid is an invertebrate, and it can grow to a length of 65 feet (20 meters).

The simplest animals are invertebrates. These include protozoans with just one cell as well as sponges and other simple animals that live in the water.

The invertebrate animals can be grouped according to their features. Many of them, such as worms, have soft bodies. Corals, jellyfish, and sea anemones are invertebrates that have stinging tentacles. Mollusks have soft bodies as well, but most also have a thick outside shell. Oysters and snails are mollusks. Squid and octopuses are also mollusks even though they do not have shells.

Some invertebrates have a tough, spiny skin that protects their bodies. These invertebrates are called echinoderms. Starfish and sea urchins are examples of echinoderms.

Other invertebrates have a hard outside covering on their bodies called an exoskeleton. These invertebrates are called arthropods. Arthropods include insects, spiders, centipedes, millipedes, and crustaceans such as lobsters and crabs.

Iowa

The Native Americans known as the Iowa (or Ioway) once lived near the Great Lakes. By the 1700s, however, they had moved to what is now the state of Iowa. The state was named after the tribe.

The Iowa lived in villages of dome-shaped houses covered with earth. They grew corn, beans, and squash. They also hunted bison (buffalo) and deer. After getting horses in the 1700s the Iowa covered greater distances while hunting

Shauhaunapotinia was a chief of the Iowa people.

on the Great Plains. On the hunt they lived in tepees covered with bison hides.

French traders began visiting Iowa villages in about 1700. They carried a disease called smallpox that killed many Iowa. U.S. explorers led by Meriwether Lewis and William Clark passed through Iowa territory in the early 1800s. Many settlers followed.

In 1836 the U.S. government forced the Iowa to move to a reservation in what are now Kansas and Nebraska. Later in the 1800s the United States tried to move the Iowa to Indian Territory (now Oklahoma). Not all the Iowa moved. The tribe separated into two groups now known as the Iowa Tribe of Oklahoma and the Iowa Tribe of Kansas and Nebraska. At the end of the 20th century there were about 1,500 Iowa.

Iowa

The skyline of downtown Des Moines provides a modern backdrop to the Iowa state Capitol.

The U.S. state of Iowa is one of the most productive agricultural areas in the United States. It is sometimes called the Tall Corn State because that crop grows well there. Iowa's official nickname, however, is the Hawkeye State, in honor of a Native American leader named Black Hawk. The state was named for the Iowa (or Ioway) Indians who once lived in the area. The state capital is Des Moines.

Geography

Iowa lies in the north-central part of the United States. The state is located between the Mississippi River in the east and the Missouri River in the west.

Iowa is bordered by Minnesota on the north, Wisconsin and Illinois on the

east, Missouri on the south, and Nebraska and South Dakota on the west. There are two chief breaks in the state's level sweep of land. Steep cliffs drop to the Mississippi River in the northeast. Low, moundlike bluffs rise above the prairies in the southwest. Summers are warm and humid. The winters are cold.

People

Whites of European heritage make up more than 90 percent of Iowa's population. Hispanics represent about 3 percent of the population and African Americans about 2 percent. Iowa is a checkerboard pattern of farms, towns, and cities. Most Iowans live in small communities. The state's largest cities are Des Moines, Cedar Rapids, and Davenport. The main public institutions of higher learning are the University of Iowa, at Iowa City; Iowa State University, at Ames; and the University of Northern Iowa, at Cedar Falls.

Economy

With rich soils, mostly flat ground, and plenty of rainfall, Iowa is an almost perfect place to grow crops. About 90 percent of its land is used for agriculture. The state specializes in corn, soybeans, and livestock (especially hogs and cattle). Dairy production is a major industry in the northeast part of the state.

Despite the importance of agriculture in Iowa, the state's leading sources of income are manufacturing and services such as real estate, insurance, and health care. The most important manufacturing industries are the production of industrial machinery and the processing of food.

History

The earliest settlers in what is now Iowa were Native Americans. From about AD 300 to the 1600s eastern Iowa was inhabited by Native Americans who built great earth mounds, some in the shape of animals.

The French explorers Louis Jolliet and Jacques Marquette reached Iowa in 1673. They were probably the first Europeans to set foot in the area. No Europeans settled there permanently, however, until the early 1830s.

Iowa was part of the area called the Louisiana Purchase that the United States bought from the French in 1803. The territory of Iowa was formed in 1838. It entered the Union as the 29th state in 1846.

An Iowa farmer checks young corn plants for damage and disease. Corn is an important crop in Iowa.

The state was strongly against slavery and fought on the side of the Union during the American Civil War (1861–65). Shortly after the war Iowa became a center of the Grange movement. Granges were groups of farmers who came together to find ways to solve common problems.

Agriculture continues to be a central feature of Iowa. In 1959 a leader of the Soviet Union visited the state. In the spirit of cooperation created by the visit, Iowa began to export, or sell, some of its grain to that country. Since then Iowa has exported agricultural products to many overseas countries.

In 1988 Iowa farmers had problems due to heat and drought. The opposite took place in 1993 as too much rain caused the Mississippi River to flood many farms and cities.

Iran

Iran is a country of southwest Asia. For much of its history Iran was known as Persia to the outside world. However, the people of the region have called their country Iran for thousands of years. Iran means “land of the Aryans.” The Aryan people settled in the region in ancient times. Iran’s capital is Tehran.

Geography

Iran is part of the region called the Middle East. It shares borders with Iraq, Turkey, Armenia, Azerbaijan, Turkmenistan, Afghanistan, and Pakistan. Iran has coastlines on the Caspian Sea, the Persian Gulf, and the Gulf of Oman.

Iran’s land is high in elevation, except for narrow regions along the coasts. Mountain ranges surround a large central area of rocky highlands and deserts. Parts of the vast deserts are sandy, while a crust of salt covers other parts. The highest point in Iran is Mount Damavand in the northern Elburz Mountains. It reaches a height of 18,606 feet (5,671 meters). Iran has active volcanoes, and damaging earthquakes often occur.

The temperatures in Iran vary from very hot to very cold, depending on location and season. Most of the country is dry, except for a region around the Caspian Sea.

Plants and Animals

Forests cover only a small part of Iran. The largest forests are in the rainy

Caspian Sea region. Oaks and other trees grow there and in the southwestern Zagros Mountains. In the dry interior the vegetation is shrubby and grassy. However, a few areas of the desert, called oases, get water from underground. Grape vines, oleanders, date palms, and mulberry trees grow in the oases.

Iran’s wildlife includes bears, wild boars, gazelles, wild asses, rabbits, and many kinds of rodents. Seagulls, ducks, and geese are common birds.

People

Many ethnic groups live in Iran. Persians make up the largest group. Azerbaijanis, Kurds, Lurs, and other peoples form smaller groups. The main language is Farsi, or Persian. Each of the ethnic groups has its own language as well. Most Iranians live in cities or towns.

TIMELINE

The Persians begin building a great empire.

about 550 BC

The Safavid dynasty takes power.

1502

Iran becomes an Islamic republic.

1979

Ali Khamenei becomes Iran's new religious leader.

1989

Arabs bring Islam to Iran.

AD 640

Reza Khan becomes shah of Iran.

1925

The Iran-Iraq War begins.

1980

About 90 percent of the people belong to the Shi'ah branch of Islam, which is the state religion. (In most Muslim countries, Sunnah is the more common branch of Islam.) A small percentage of Iranians practice Zoroastrianism, the religion of ancient Persia.

Economy

Iran is one of the world's leading producers of petroleum (oil). Iran also produces natural gas, chemicals, metals, food products, cloth, and machinery. Iran has been famous for its carpets for hundreds of years. Traditional carpets are still an important export. Services—including government work, banking, and tourism—are also important to the economy.

Iran's crops include grains, sugar beets, and many kinds of fruits and nuts. Sheep are the main livestock. Commercial fisheries operate in the Persian Gulf and in the Caspian Sea.

History

The Aryan people came from central Asia to what is now Iran sometime after 2000 BC. The two main groups of Aryans were the Medes and the Persians. The Persians took control in about 550 BC. They conquered vast territories. The Persian Empire soon stretched from North Africa to the Indus River in south Asia. The European conqueror Alexander the Great held Persia for a time starting in about 330 BC.

A mosque with its welcoming courtyard stands in the city of Esfahan in western Iran.

Muslim Rule

Arab conquerors brought Islam to Iran in 640. For about 850 years non-Iranian Muslims ruled Iran. Then, in 1502, the Iranian Safavid dynasty took control.

A weaker dynasty, the Qajars, ruled from 1779 to the early 1900s. During the Qajars' rule Russia and Great Britain won control over parts of Iran.

The Pahlavi Dynasty

In 1921 Reza Khan, an army officer, seized control of the country. In 1925 he became shah, or king, and took the name Reza Shah Pahlavi. His reign started the Pahlavi dynasty. Reza Shah built modern schools and a railroad. He also gave Iranian women more rights.

Reza Shah's son, Mohammad Reza Shah Pahlavi, took the throne in 1941. The new shah continued to make Iran more modern. However, he also used secret police to stop those who disagreed with him.

Many religious leaders felt that the shah's ideas went against Islam. The government threw one of those leaders, Ayatollah Ruhollah Khomeini, out of the country in 1964.

From outside Iran, Khomeini led a revolution against the shah. Huge protests forced the shah to leave Iran in 1979.

The Islamic Republic

Khomeini then returned to Iran. He declared himself Iran's political and religious leader for life. He renamed the country the Islamic Republic of Iran.

A woman weaves a carpet on a large loom in Iran. Traditional carpets from Iran are known for their fine quality and design.

Khomeini's government enforced strict Muslim laws. It also banned Western (U.S. and European) influences.

In late 1979 supporters of the revolution seized the U.S. embassy (a building that belonged to the U.S. government) in Tehran. They captured 66 U.S. citizens and held them for more than a year.

In 1980 Iraq invaded Iran, and the Iran-Iraq War began. The war ended in 1988. More than a million people were killed or injured during the war. However, neither side won a clear victory.

Khomeini died in 1989. Iran then chose a new religious leader, Ali Khamenei. Khamenei continued the government's strict policies. He worked with the country's presidents. However, Khamenei and other religious leaders still controlled much of the government.

Iran-Iraq War

Differences between the neighboring countries of Iran and Iraq led to war in 1980. The fighting lasted for eight years. The Iran-Iraq War brought terrible destruction to both countries but ended with no clear winner.

Background

In 1979 there was a revolution in Iran. A strict religious leader named Ayatollah Ruhollah Khomeini came to power. Saddam Hussein, the leader of Iraq, did not want the revolution to spread to his country. He was also angry at Iran for supporting the Kurds, a minority group, in a rebellion against Iraq.

Iran and Iraq had disagreed for years over an oil-producing area on their border. Saddam Hussein wanted to take control of the region, which is in south-

An Iraqi soldier crouches behind cover during the Iran-Iraq War.

western Iran. He used this land dispute as an excuse to start a war.

Events of the War

Iraq invaded Iran by surprise in September 1980. Iraq won a few early victories. However, Iran did not give up as Saddam Hussein had expected. By mid-1982 Iran had won back almost all the land that Iraq had taken. Then Iranian forces pushed into Iraq.

For the next five years the two sides were evenly matched. Both suffered heavy losses. Iran and Iraq bombed each other's cities, oil fields, and tanker ships, which were used for shipping oil. Iraq got help from many countries, including the Soviet Union, Great Britain, and the United States.

Neither country obeyed the usual rules of war. Iraq used many chemical weapons. That had not been done by any country since World War I (1914–18). Iran cleared minefields by forcing young village boys to walk through them.

In 1987 Iraq started winning the war. In 1988 Iran accepted an agreement to end the fighting. At least 1 million people were killed or injured.

Peace talks continued until 1990. The countries agreed to share control of a river on their border. Iraqi troops left Iran in 1991. The last prisoners of war were exchanged in 2003.

Iran • Iraq

Iraq

The minaret, or tower, of a mosque in Samarra, Iraq, spirals to a height of about 170 feet (52 meters).

The country of Iraq covers the ancient region of Mesopotamia, a Greek word meaning “land between the rivers.” Those ancient rivers, the Tigris and the Euphrates, still run through Iraq. Today Iraq is one of the world’s leading oil producers. Baghdad is the capital and largest city.

Geography

Iraq is located in Southwest Asia in the region known as the Middle East. It borders Turkey, Iran, Kuwait, Saudi Arabia, Jordan, and Syria. Iraq has a short coastline on the Persian Gulf.

The central and southeastern parts of the country are plains with many lakes. Marshy lowlands surround the area where the Tigris and Euphrates rivers

meet, near the Persian Gulf. North of the plains, between the rivers, is a dry area known as Al-Jazirah. Western and southern Iraq is a vast desert. Highlands in the northeast include the mountainous region known as Kurdistan.

The plains and deserts have very hot summers and mild winters. Those regions receive little rainfall. The northeast is cooler and wetter, especially in the mountains.

Plants and Animals

Iraq has many date trees but very few forests. Willows, poplars, and licorice plants grow along the Tigris and Euphrates rivers. Reeds and tall grasses cover the marshlands. There are few plants in the deserts or on the dry plains.

The wild animals of Iraq include hyenas, pigs, jackals, foxes, and rabbits. Among the many varieties of birds are ducks,

partridges, snipes, and herons. People raise water buffalo in the marshlands.

People

Arabs make up the majority of Iraq's population. They speak Arabic, which is the country's main language. The Kurds form the next-largest group. They speak Kurdish and live mainly in the north and northeast. Almost all Iraqis are Muslims.

Most Iraqis live in cities and towns, where they lead modern lifestyles. Many rural Iraqis farm the land or raise livestock.

Economy

Wars in the late 20th and early 21st centuries badly hurt Iraq's economy. However, oil still provides almost all of Iraq's earnings from trade. Iraq also produces oil products, chemicals, construction materials, and processed foods. It imports food, medicine, and other goods.

Farming is another important part of the economy. Crops include wheat, dates, potatoes, tomatoes, barley, watermelons, oranges, grapes, and cucumbers. Iraqis also raise sheep and cattle.

History

Iraq's history reaches back thousands of years. In about 3300 BC the Sumerians created one of the world's first civilizations in Mesopotamia. People from Babylonia, Assyria, Persia, Macedonia, and other nearby areas later ruled the region.

Arab and Ottoman Rule

Muslims from Arabia conquered the area in the AD 600s. For a time Baghdad was the center of the Muslim world. Many of the greatest Muslim philosophers, poets, and writers lived there. In 1258 a group called the Mongols conquered the city. Iraq then became a land of small kingdoms. The Ottoman Turks took control in the 1500s. Iraq remained

part of the Ottoman Empire until the 20th century.

The Republic of Iraq

During World War I (1914–18) British troops occupied Baghdad and ended Ottoman rule. After the war Iraq remained under British protection. In 1921 Iraq became a monarchy. The country achieved full independence in 1932. A revolution led by a group of army officers ended the monarchy in 1958. Iraq then became a republic.

In the 1960s and 1970s the Iraqi government faced a rebellion by the Kurds. The rebels wanted self-government. Iran provided military aid to the Kurds, which strained relations between Iraq and Iran. The Kurdish rebellion collapsed in 1975, but occasional fighting continued into the 21st century.

The Iran-Iraq and Persian Gulf Wars

Saddam Hussein became Iraq's president in 1979. A year later Iraq invaded Iran. The resulting Iran-Iraq war lasted until 1988. Neither side won a clear victory.

In 1990 Saddam ordered Iraqi troops to invade the neighboring country of Kuwait. Iraq claimed that Kuwait had been part of its territory since 1871. The invasion led to the Persian Gulf War of early 1991. In less than two months, a group of nations led by the United States pushed Iraq's forces out of Kuwait.

A rocket blasted a hole in an archway leading to the National Museum of Iraq in Baghdad during a war in 2003. The city suffered heavy damage during the war.

Ongoing Troubles

At the end of the Persian Gulf War, weapons inspectors from the United Nations entered Iraq. The inspectors wanted to make sure that Iraq destroyed some of its weapons and stopped making more. Iraq refused to cooperate with the inspectors.

The United States and Great Britain feared that Iraq was building illegal weapons. As a result, U.S. and British forces invaded the country in March 2003. The foreign troops soon took control of Iraq and captured Saddam. The foreign forces and Iraqi leaders then worked to set up a new government in Iraq. However, some Iraqis continued to fight the foreign troops and the new Iraqi leaders. Violence also broke out between followers of the Sunnah and Shi'ah branches of Islam.

Ireland

Known as the Emerald Isle, Ireland is famous for its green countryside. Throughout much of its history, Ireland fought against rule by Great Britain. Most of the island gained independence in the 1920s. However, Britain continued to control a section called Northern Ireland. In the 1990s the independent republic of Ireland became a successful member of the European Union. The capital is Dublin.

Geography

The Republic of Ireland occupies most of the island of Ireland. Its neighbor, Northern Ireland, occupies one sixth of the island. The island lies off the western coast of Great Britain, from which it is separated by the Irish Sea. The Atlantic Ocean borders western Ireland.

A low-lying plain spans most of eastern and central Ireland. Hills and low mountains rise mainly in the west.

Carrantuohill, at 3,414 feet (1,041 meters), is the highest point in the country. The most famous of Ireland's rivers is the Shannon. The country has mild summers and cool winters with plenty of rain.

Plants and Animals

Grasslands, heather, and pastures cover most of the country. Mosses and lichens grow throughout the island. Ireland has few trees. Most of the original forests were cut down long ago for lumber and to clear the land for farming.

Ireland has a wide variety of birds and fish. Mammals include mice, hares, and stoats (animals similar to weasels). The only reptile in Ireland is a type of lizard. There are no snakes. According to legend, Saint Patrick chased all the snakes from the island, but it is unlikely that Ireland ever had any.

People

Most people in Ireland are ethnic Irish, whose main ancestors were the ancient Celts. English people form a small group. Students learn both Irish (also called Gaelic) and English in school, but the everyday language is English. Most Irish are Roman Catholics. About 40 percent of the people live in rural areas.

Beginning in the mid-1800s, large numbers of people left Ireland because of crop failures, a poor economy, and high unemployment. Today more Irish

Colorful houses line the street in the village of Eyeries in southern Ireland.

people live outside Ireland than inside the country.

Economy

Ireland's people relied on farming for their income for much of the 1900s. During the 1990s, however, the country enjoyed great economic growth. This was due in part to the development of a technology industry. Services, including finance, transportation, and public administration, are now Ireland's main economic activities. Tourism is one of the country's largest service industries.

Manufacturing, mining, and construction are also very important to the economy. Among Ireland's products are office equipment and computers, chemicals, medicines, alcoholic beverages, and clothing. Ireland has limited natural resources, including zinc, lead, and silver, as well as small reserves of natural gas and coal.

Agriculture is now a small part of the Irish economy. Crops include sugar beets, barley, wheat, and potatoes. Farm-

ers raise cattle for meat and milk, sheep for wool, and pigs for meat. Fishing is another source of food.

History

The first people to live in Ireland were hunters and fishers. They came from the European mainland in about 6000 BC. Later settlers brought knowledge of farming in about 3000 BC and skills in metalworking by about 2000 BC.

In about 300 BC invaders from Europe known as Celts overran Ireland. The Celts wiped out almost all the earlier inhabitants. They set up a number of kingdoms on the island.

In the AD 400s Saint Patrick helped to spread Christianity among the population of Ireland. Ireland remained peaceful until the late 700s, when Vikings invaded. The Irish finally defeated the Vikings in 1014.

English Rule

In 1170–71 English armies conquered large parts of Ireland. In the early 1600s

The Newgrange tomb in Ireland was built in about 3200 BC. Ancient peoples buried their dead inside the tomb.

TIMELINE

The Celts settle in Ireland.		England begins conquering Ireland.		The Irish potato famine begins.		The Irish Free State votes to become an independent republic.

England sent English and Scottish Protestants to settle in northern Ireland. Irish Catholics revolted against those settlers in 1641, but the English crushed the revolts. They also imposed strict anti-Catholic laws.

By the end of the 1600s England firmly controlled the island. In 1801 the Act of Union joined Great Britain (England, Scotland, and Wales) and Ireland together to form the United Kingdom.

Independence

The Irish strongly opposed British rule. Beginning in 1919 a group called the Irish Republican Army (IRA) fought the British Army for independence. In 1921 Britain agreed to make the southern part of the island the Irish Free State. Six counties in the north remained under direct British control, however. Those countries were renamed Northern Ireland. In 1937 the Irish Free State took the name Éire, or Ireland. Ireland

adopted a new constitution, though it kept some ties to Britain.

In 1949 Ireland became a fully independent republic. Britain and Ireland struggled over control of Northern Ireland until 1973. That year the government of Ireland acknowledged British rule in the north. But the IRA, now separate from the Irish government, continued to attack the British in the hope of reuniting Ireland. The Irish government helped work out a peace agreement between the two sides in 1998.

In 1993 Ireland became one of the original members of the European Union. At the start of the 21st century, Ireland welcomed growing numbers of immigrants for the first time in its modern history.

Iris

The Siberian iris grows in central and eastern Europe. Its flowers may be violet-blue or white.

Irises are popular garden flowers. They are known for their wide variety of colors and their unique petal shapes. There are about 300 species, or types, of iris. They grow mostly in mild northern regions. Some of the most beautiful species are from central Asia and the area around the Mediterranean Sea.

Some irises grow from bulbs. Others grow from the rhizomes of other iris plants. Rhizomes are vinelike stems that spread out just beneath the surface of the soil. New plants grow from different points on a rhizome.

Irises have six petals. The three inner petals stand upright and are called standards. The three outer petals droop down and are called falls. The petals can be white, yellow, pink, red, blue, purple, brown, or even black.

The best-known irises are the common garden irises. They are also called bearded irises. This is because each of the falls has a fuzzy growth that looks something like a beard. Bearded irises grow from rhizomes. They have stiff, swordlike leaves and long stems. They can grow to 3 feet (90 centimeters) tall. They usually have a strong fragrance.

Iron

Iron is the most widely used metal on Earth. Iron is used to make steel. In turn, steel is used to make buildings, bridges, railroad tracks, vehicles of all kinds, and countless other products.

People make some decorative railings out of iron.

Did You Know?

Iron pounded into a shape is called wrought iron. Iron poured into a mold is called cast iron.

Iron in Earth's Crust

Iron is the second most common metal in Earth's crust. Of the metals in the crust, only aluminum is more common. Iron is also the fourth most common element (basic substance) in the crust.

Iron in its pure form is a heavy, silvery, magnetic metal. But iron is almost never found in its pure form in nature. Instead, it is found in the form of iron ores. Ores are minerals with mixtures of different elements. The main iron ores are made up of iron linked to oxygen or to oxygen and carbon.

Separating and Using Iron

Workers separate pure iron from iron ore by a process called smelting. Smelting involves heating iron ore to a very high temperature. As the iron ore melts, the pure iron separates from the ore.

Hot lumps of iron may be pounded into shapes. Melted iron may be poured into molds of different shapes. As the iron cools, it hardens. Today, however, most iron is made into steel. Steel is a mixture of iron and carbon. Steel is stronger than iron alone.

Thousands of years ago people may have gotten iron from iron meteorites. Meteorites are chunks of rock that fall to Earth from outer space. After ancient peoples discovered how to smelt iron, they learned how to make iron tools and weapons. During a period called the Iron Age, the knowledge of how to use iron spread across Europe and Asia.

Iron in the Body

Iron is an important part of a person's diet. Good sources of iron are red meat, chicken, tuna, egg yolks, beans, whole grains, dried fruit, and leafy green vegetables. The body uses iron to build a substance called hemoglobin in the blood. Hemoglobin carries oxygen to all the cells in the body. The cells use the oxygen to release the energy they need to do their jobs.

Iron Age

The Iron Age was a time in early human history when people began to use tools and weapons made of iron. The Iron Age started and ended at different times in different places. The earliest Iron Age probably took place in the Middle East

People in eastern Europe made iron tools more than 2,400 years ago.

and southeastern Europe. It started there in about 1200 BC.

Background

The earliest human beings lived during the Stone Age. Stone Age peoples made tools and weapons of stone. Later they learned to make tools and weapons from copper and from bronze, which is a mixture of copper and tin. This time was known as the Bronze Age. The Iron Age started after people learned to remove iron from rock using a very hot fire. Iron was better than bronze for tools and weapons because it was harder and stronger.

Events of the Iron Age

The knowledge of how to get iron from rock and how to make iron tools spread quickly from the Middle East to Egypt and Greece. The Iron Age eventually spread as far as West Africa, northern Europe, India, and East Asia. Australia and the Americas did not have an Iron Age. European settlers brought iron-working to those places much later.

The use of iron brought important changes to people's lives. People used iron to make strong tools, which made farming easier. They also made iron swords and other weapons. Huge armies of soldiers soon carried iron weapons. These weapons made an army much harder to defeat. Armies traveled to other lands and took over places they liked. Kings and other rulers gained great power.

Other changes in technology also happened during the Iron Age. People built

A museum in Great Britain shows the type of house that people built in about 300 BC, during the British Iron Age. The house is made of wood, plant materials, and mud.

large forts and bridges. Pottery and weaving improved. Humans dug deep mines in the ground to find salt and other valuable minerals.

End of the Iron Age

The Iron Age came at the end of prehistory, or the time before humans used writing. (In some places people were already using early forms of writing when the Iron Age began.) The Iron Age ended as writing became widespread and as civilization grew more complex.

Still, iron was the most important metal until the 1800s. People had often mixed iron with other materials to make it stronger, but in the 1800s they learned easier ways to do this. As a result steel (a mixture of iron and carbon) became more widely used than iron alone.

Iroquois

The Iroquois Confederacy was a powerful alliance, or group, of Native American tribes in the 1600s and 1700s. The five original Iroquois tribes were the Cayuga, the Mohawk, the Oneida, the Onondaga, and the Seneca. The Tuscarora joined later. The Iroquois lived mainly in what is now the U.S. state of New York. Many Iroquois still live in New York. Others live in Wisconsin or southern Canada.

The Iroquois traditionally lived in buildings called longhouses. They built longhouses by covering a wooden frame with tree bark. Each longhouse was large enough for several families. For food, the Iroquois planted fields of corn, beans, and squash. They also fished and hunted deer.

According to tradition, the Iroquois Confederacy was founded by a chief named Hiawatha in the late 1500s. French explorers arrived in Iroquois territory in the 1600s. The Iroquois fought the French and their Indian allies. They

The Iroquois made houses out of tree bark and carved canoes out of logs.

became allies and trading partners of the British, who were enemies of the French. With guns that they got in trade, the Iroquois drove enemy tribes out of their land.

The American Revolution (1775–83) split the confederacy. The Mohawk, the Seneca, the Onondaga, and the Cayuga remained loyal to the British. They were led by the Mohawk chief Joseph Brant. The Oneida and the Tuscarora helped the Americans.

After the war the Iroquois lost much of their New York land. The British gave Brant some land in Ontario, and many Iroquois moved there. At the end of the 20th century there were about 80,000 Iroquois.

Irrigation

Irrigation is what farmers do when they add water to their fields. The water makes their crops grow. Irrigation takes the place of rainfall in dry regions. It can greatly increase farm production. However, irrigation can also cause problems with the environment.

Getting Water

Most water for irrigation comes from the ground or from a river. Farmers get water from the ground by digging a well. Then they lift or pump the water from the well.

Irrigation allows farmers to grow crops in dry areas such as the desert of Saudi Arabia.

Farmers may get water from a river by digging a channel, or path, from the riverbank. They also may collect river water by building a dam across the river. Water collects behind the dam in an artificial lake called a reservoir.

After getting water, farmers move it to the farm fields. They move it through canals or pipelines. Gravity moves the water if the fields lie lower than the water source. If the water source lies lower than the fields, then farmers use pumps to raise the water.

Applying Water

The next step in irrigation is to deliver the water to the plants in the fields. There are many ways to do this. They include surface, subsurface, and overhead irrigation.

Surface irrigation systems apply water directly onto the soil surface. One kind of surface irrigation is called flood irrigation. This method floods the growing plants with water. Rice is the main crop irrigated by flood irrigation.

A second kind of surface irrigation is called furrow irrigation. A furrow is a shallow ditch between two rows of growing plants. Water flows into the furrows and then soaks into the earth. Potatoes, sugar beets, cotton, and corn are often irrigated by furrow irrigation.

A third kind of surface irrigation is called drip, or trickle, irrigation. Pipes with holes in them drip water onto plants. This method is good for dry regions. Because the plants get so little water at one time they can use it right away. This way, no water is wasted.

Subsurface irrigation systems apply water beneath the soil's surface. Buried pipes with holes in them deliver water to the plants. This method is good for fruit plants and garden vegetables.

Overhead irrigation systems spray or sprinkle water over crops. Rotary sprinklers are a common form of overhead irrigation. They sprinkle water in a wide circle while moving slowly across a field.

Water flows through furrows in a field in Idaho.

An overhead sprinkler system waters the crops on a farm in France.

Not all irrigation water gets to the plants. Some evaporates into the air, sinks deep into the ground, or runs off along the ground. An irrigation system usually includes a drainage system—ditches or underground pipes—to remove excess water from the soil.

Environmental Issues

Irrigation can cause environmental problems. Irrigation water contains more salt than rainwater. Salt can build up in the soil and harm plants. Salt buildup has ruined farmland in India, Pakistan, and other countries.

Taking too much water to use for irrigation can cause water shortages in other places. Irrigation now takes more water than nature can replace from the ground in some areas. In central Asia, the rivers that flow into the Aral Sea are heavily used for irrigation. The sea (actually a salt lake) is getting smaller as a result.

History

Ancient farmers irrigated crops by channeling river water. The Egyptians first used Nile River water about 7,000 years ago. The people in Mesopotamia (what is now Iraq) used the Tigris and Euphrates rivers. The people of the ancient Indus Valley civilization used the Indus River. The ancient Chinese used the Huang He, or Yellow River.

Native Americans were using irrigation more than 2,000 years ago. The Inca of Peru developed an advanced farming civilization based on irrigation. In about AD 1200 the Hohokam Indians built irrigation systems in what is now the U.S. state of Arizona.

Since then more and more land has come under irrigation. In the 1900s the U.S. government built many large dams for irrigation purposes. In the early 21st century India, China, the United States, and Pakistan had more irrigated land than any other countries.

Isis and Osiris

Isis and Osiris were among the most important gods in ancient Egyptian mythology. Osiris was the god of the dead. He was also the god of crops and plentiful growth. Isis was his wife and

The ancient Egyptians worshipped many gods. Isis (right) and Osiris were two of the most important gods.

sister. She was a mother goddess believed to have great magical powers. Isis and Osiris had a son named Horus. The

Egyptians considered Isis and Horus to be the perfect mother and child.

According to legend, Osiris and Isis had a brother named Seth (or Set). Seth was a god of violence and disorder. He tricked Osiris into climbing into a wooden box. When Osiris climbed in, Seth slammed the lid shut. He threw the box into the Nile River, sending Osiris to his death.

Stories tell that Isis mourned her husband's death deeply. She recovered Osiris' body and buried him. Isis then used her great magic to give new life to Osiris. From then on, he was considered the ruler of the land of the dead, or underworld. Osiris was said to grant people life after death in the underworld.

Islam

Islam is one of the world's major religions. Its founder was Muhammad. Islam has about 1.3 billion followers worldwide. Most of the followers of Islam, called Muslims, live in North Africa, the Middle East, and southern and central Asia.

Beliefs

At the core of Islam is this idea: "There is no God but Allah, and Muhammad is the prophet of Allah." Muslims believe that Allah created the universe and that humans must submit to his will. The content of the Koran, the

Did You Know?

Muslims consider Adam, Noah, Abraham, Moses, and Jesus to be prophets.

Muslims pray at a mosque in India.

holy book of Islam, is believed by Muslims to be the word of Allah as told to Muhammad.

Practices

Five duties, called the five pillars of Islam, are expected of every Muslim. The first is the most important: to profess that there is one God and that Muhammad was his prophet. The second duty is prayer. Muslims pray five times a day. On Fridays communities gather at a place of worship, called a mosque, for special prayers. The third duty is charity. The fourth duty is to fast, or refuse to eat, from sunrise to sunset during the holy month of Ramadan. The fifth duty is to make a

pilgrimage, or journey, to the holy city of Mecca in Saudi Arabia at least once.

Divisions

There are two major branches of Islam. Most Muslims belong to the Sunnah branch. They are called Sunnites. Sunnites are known as traditional Muslims. They follow the sayings of Muhammad and emphasize community.

Members of the smaller Shi'ah branch are called Shi'ites. They believe that the truths of the Koran are revealed only through a community leader called the imam. Interpretations by other people are not accepted. For this reason Shi'ites are not as open to other views as Sunnites are.

History

Muhammad

According to Muslims, in 610 an angel told Muhammad that Allah had chosen him as a prophet. Throughout his life, Muhammad continued to receive messages that he believed came from God.

The idea that there is only one God was unusual for Arabs at the time. Many people in Muhammad's hometown of

Some Important Islamic Holidays		
Holiday	Meaning	Date
Ramadan	a month of fasting, or not eating, during daylight hours	ninth month of the Islamic calendar
‘Id al-Fitr	celebration of the end of Ramadan	first three days of the 10th month of the Islamic calendar
‘Id al-Adha	end of the time of the hajj, or the journey to Mecca	begins on the 10th day of the last month of the Islamic calendar and lasts for four days
Note: The Islamic calendar is based on the Moon, so the holidays may occur in different seasons.		

Mecca disliked the new religion because of that belief. To avoid their hostility, Muhammad encouraged his followers to move to the nearby city of Medina. Muhammad's journey to Medina ended on September 24, 622, which is considered the starting point of Islamic history.

Division and Spread of Islam

Muhammad eventually persuaded most of the people of Arabia (including Mecca) to practice Islam. But after his death in 632, Muslims disagreed as to who should lead them. Muhammad's son-in-law 'Ali became the Muslim leader, or caliph, in 656. But he was murdered in 661. Some Muslims maintained that Muslim leadership belonged to 'Ali's descendants alone. They formed the Shi'ah branch of Islam. The Muslims who disputed this claim became the Sunnites.

During the 600s and 700s, Islam spread far beyond Arabia, from the western Mediterranean region to central Asia. Holy wars called jihads were fought to gain political control over societies so that they could be run using Islamic principles.

In the 11th century the Turks began their rise as an Islamic power. The Seljuk Turks conquered vast territories in the Middle East. In 1071 they captured Jerusalem. The Seljuks refused to allow Christians to visit holy sites in the land they controlled. Over the next two centuries, Muslim powers fought off Christian attempts to win back the Holy Land in a series of wars known as the Crusades. In the 1200s another group of

Muslim Turks, the Ottomans, began an empire. The Ottomans eventually ruled over North Africa, the Middle East, and southeastern Europe for hundreds of years.

Islam in Modern Times

During the 1800s and 1900s Western powers established colonies in Muslim nations for the purpose of trade. Islamic leaders lost political power. However, Muslims drew together more as a community in the face of colonization. In the 1900s this sense of unity helped many Muslim countries in their struggles for political independence.

In the late 1900s Islam became one of the fastest-growing world religions. Some Muslims have resisted the influence of the West, which they view as leading to a loss of traditional Muslim values. In Iran a revolution brought Islamic religious

Pakistan

Island

An island is an area of land that is surrounded by water. Islands can be found in all bodies of water, from streams and rivers to lakes, seas, and oceans. The two main types of islands are oceanic islands and continental islands.

An oceanic island in the South Pacific rises from the ocean floor.

Formation of a Coral Atoll

An atoll is a ring of land surrounding a pool of water called a lagoon. This kind of island forms from a volcanic island circled by a coral reef.

Oceanic Islands

Oceanic islands are the tops of underwater volcanoes. An oceanic island forms when a volcano erupts deep under the ocean and pushes the ocean floor upward into a mountain. The island is the top of that mountain. The Hawaiian Islands are examples of oceanic islands.

Atolls are another type of island in the ocean. An atoll is a ring of land around a shallow body of water called a lagoon. Atolls form when corals build a colony, or reef, around the top of an underwater volcano. Eventually the reef reaches the surface of the water and becomes land. Atolls make up the country of the Marshall Islands.

Continental Islands

Continental islands are close to the continents. They are parts of the same land that makes up the continents. One way that continental islands form is by the flooding of valleys close to the coast. The valleys fill with seawater, and the tops of nearby hills then become islands. Long Island, which lies off the coast of

the U.S. state of New York, is a continental island.

The islands in rivers and lakes are also continental islands. The city of Paris, France, began as a settlement on an island in the Seine River.

Archipelagoes

An archipelago is a group of islands. The islands in archipelagoes may be oceanic or continental. Japan and the Aleutian Islands in the U.S. state of Alaska are archipelagoes. Indonesia is the largest archipelago in the world.

A small continental island lies in the Seine River near the town of Les Andelys, France.

Israel

The country of Israel, located in the Middle East, was founded in 1948. It was the first homeland for the Jewish people in nearly 2,000 years. Because Israel lies in territory claimed by Arabs, it has faced conflict with neighboring Arab countries. Israel has also experienced violence between Jews and Arabs (known as Palestinians) living within its borders. Israel claims Jerusalem as its capital.

Geography

Israel borders Egypt, Jordan, Syria, and Lebanon. The Mediterranean Sea lies to the west. Israelis and the Arabs of the region have long disagreed about the limits of Israel's territory.

Along the coast is a narrow plain. Hills rise in northern and central Israel. The country's highest point, Mount Meron, is in the mountains of Galilee in the north. Several valleys run the length of

The dry region known as the Negev takes up a large part of Israel.

Israel in the east. In the south is a dry, rugged region called the Negev.

In the east the Jordan River flows southward into the freshwater Sea of Galilee and the salty Dead Sea. The Dead Sea is the lowest place on Earth. It is 1,312 feet (400 meters) below sea level. Israel generally has mild, wet winters and hot, dry summers.

Plants and Animals

Modern Israelis have planted millions of trees to replace forests that were cut down long ago. Shrubs cover the hills. Desert scrub grows in the Negev. Citrus trees grow on the coastal plain.

Israel's animals include wildcats, wild boars, gazelles, ibex, jackals, hyenas, and badgers. Among its reptiles are lizards and vipers. Birds include partridges, tropical cuckoos, and desert larks.

People

Jews make up more than three fourths of the population. Jews from all over the world began settling in the region even before Israel became an independent country in 1948. Most of the rest of the people are Arabs. Judaism is the main religion, but the majority of the Arabs follow Islam. Hebrew and Arabic are the main languages. Many people also speak English. Most people live in cities, mainly along the coast.

Economy

The economy of Israel is based on services, including banking, government work, and tourism. Manufacturing is also important. The country is a top producer of cut and polished diamonds. Other products include electronics, computer software, machinery, transportation equipment, chemicals, metals, processed foods, paper products, and clothing.

Only a small number of people work in agriculture, but Israel's farms produce much of the country's food. Crops include potatoes, tomatoes, citrus fruit, wheat, grapes, apples, olives, and cotton. The main livestock are sheep and cattle.

History

The territory now known as Israel is part of a region called Palestine. The area was the ancient homeland of the Jews. Long ago it came under the control of other rulers, though some Jewish people continued to live there. In the 600s it became part of the Muslim world. In the late 1800s Jews began a movement, called Zionism, to re-create a Jewish state. The Arabs in Palestine opposed the movement.

In 1918 the British occupied Palestine. After World War II (1939–45) the British asked the United Nations to help settle the disagreements between the Jews and the Palestinian Arabs. In 1947 the United Nations voted to divide the region into separate Jewish and Arab states. Arab leaders refused to accept that decision. The State of Israel declared its independence in 1948.

The Arab-Israeli Wars

Egypt, Jordan, Syria, Lebanon, and Iraq immediately declared war on Israel. Israel won the war. It was the first of several Arab-Israeli wars. In 1949 Israel took control of three fourths of Palestine, twice as much land as proposed by the United Nations.

Israel gained more territory in the Six-Day War of 1967. It took the eastern

part of Jerusalem and the West Bank from Jordan, the Sinai Peninsula and the Gaza Strip from Egypt, and the Golan Heights from Syria. In 1973 Egypt and Syria launched a surprise attack on Israel. Israel lost many soldiers but eventually won the war.

In 1979 Israel and Egypt signed a peace treaty. However, Israel's relations with other Arab countries remained poor. In 1982 Israel invaded Lebanon. It wanted

to drive out Palestinian fighters belonging to a group known as the Palestine Liberation Organization (PLO). In 1987 Palestinians living in the West Bank and the Gaza Strip began a violent protest (*intifada* in Arabic) against Israel.

The Troubled Peace Process

Peace talks between Israel, the Arab countries, and Palestinians began in 1992. The following year Israel agreed to give the Palestinians some control of the Gaza Strip and the West Bank. Soon after that Israel signed a peace treaty with Jordan. In 2000 Israeli troops pulled out of Lebanon. Five years later Israel pulled its troops and settlers out of the Gaza Strip. The peace process continued to face difficulties, however.

Haifa is Israel's main port. The city overlooks the Mediterranean Sea.

Istanbul

Population
(2007 estimate)
10,757,327

Istanbul is the largest city in the country of Turkey. A channel of water called the Bosphorus divides the city into two parts. One part of Istanbul is in Europe, while the other part is in Asia.

For more than 1,500 years Istanbul was the capital of a series of powerful empires. Today Ankara, not Istanbul, is the capital of Turkey. However, Istanbul is the center of Turkey's economy and culture.

Places of Interest

A former church in Istanbul called the Hagia Sophia is considered one of the world's greatest buildings. The church was built in the 500s. It later became a mosque and then a museum.

The Topkapi Palace in Istanbul was home to the rulers of the Islamic Ottoman Empire. Many mosques were built in the city during their rule. They include the large Mosque of Süleyman and the Blue Mosque.

Economy

Istanbul is Turkey's center of trade, banking, tourism, and other service industries. The city is also an industrial

The Blue Mosque (front) is one of several magnificent mosques in Istanbul.

center. Factories in Istanbul make fabrics, clothing, processed foods, chemicals, and cement.

History

The Greeks founded the city as a colony in about the 600s BC. They named it Byzantium. In AD 330 the Roman emperor Constantine made the city the capital of the Roman Empire. He renamed the city Constantinople. The eastern part of the Roman Empire later became the Byzantine Empire. Constantinople was its capital for many centuries.

The Ottoman Turks captured Constantinople in 1453. They made it the capital of the huge Ottoman Empire. Under Ottoman rule the city became known as Istanbul. The Ottoman Empire ended in 1918. Istanbul soon became part of the new country of Turkey.

Italy

The European country of Italy is shaped like a high-heeled boot. Two thousand years ago the capital of Italy, Rome, ruled one of history's largest empires. Today Italy is an important member of the European Union.

Geography

Most of Italy's land is a peninsula that extends from southern Europe into the Mediterranean Sea. Sicily and Sardinia also belong to Italy. They are two large islands in the Mediterranean. Italy shares borders with France, Switzerland, Austria, and Slovenia. The Adriatic Sea lies to the east. Italy's longest river, the Po, flows into the Adriatic.

Italy's land is mountainous. The Alps rise in the north, and the Apennines run through the peninsula. Italy's highest point, Monte Rosa, lies in the central Alps. Southern Italy has some active volcanoes, including Mount Vesuvius

A man in Italy harvests grapes that will be used to make wine.

and Mount Etna. The south is generally warmer than the north.

Plants and Animals

At the foot of the Alps, the most common trees are evergreen cork oaks, olives, and cypresses. Beech trees grow slightly higher up. At still higher elevations grow larches and spruces. Holm oaks grow in the Apennines.

Most of Italy's animals live in the mountains. Wolves hunt in the remote Apennines. Brown bears, lynx, ibex, and other animals are protected in parks and preserves in the Alps and the Apennines.

People

Nearly all the people in Italy are ethnic Italians. Almost everyone speaks Italian. Most Italians are Roman Catholics. The majority of the population lives in cities. The largest city is Rome. In the western part of Rome is Vatican City, an independent state and the headquarters of the Roman Catholic church.

Economy

Services—including tourism, banking, and communications—are Italy's main economic activities. Manufacturing is also very important. Italy's main products include iron and steel, machinery, automobiles, electrical appliances, textiles, chemicals, ceramics, and shoes. Italy has few natural resources. It must import many of the raw materials needed for industry.

Agriculture is a smaller part of the economy. Some leading farm products are wheat, olives, and grapes. Wheat flour is used in making bread and pasta, one of the main Italian foods. Olives provide olive oil for cooking. Grapes are used to make wine. Other crops include sugar beets, corn, tomatoes, potatoes, rice, and various fruits. Farmers also raise sheep, pigs, cattle, and chickens. Fishing is another important source of food.

History

More than 2,500 years ago a group of people known as the Etruscans began building a civilization in west-central Italy. The Etruscans later fell under the control of the Romans, their neighbors

to the south. Rome became the chief power in the Mediterranean world. By AD 117 the Roman Empire stretched from Britain to North Africa to what is now the Middle East.

Later, groups of people from the north invaded the Roman Empire. By AD 476 they had destroyed the empire. After that the region was divided into many small kingdoms. Various rulers tried to control the different kingdoms. The most important of these local rulers, however, was the pope. The pope was the leader of the Roman Catholic church and was based in Rome.

City-States and the Renaissance

During this period some cities in northern Italy developed into small but powerful states. They were called city-states. Among them were Florence, Venice, and Milan. These city-states competed intensely for the control of trade between Europe and Asia.

As the city-states gained wealth from trade, they became centers of art. Their rulers and merchants encouraged architecture, painting, sculpture, and literature. This growing interest in the arts is known as the Renaissance. It made Italy the cultural center of the Western world from the 1300s to the 1500s.

From Foreign Rule to Unification

In the late 1400s France invaded Italy. Until the 1800s rulers from France, Spain, and Austria controlled the various parts of Italy.

TIMELINE

The Roman Empire falls.		Italy becomes a united kingdom.		Italy sides with Germany in World War II.		Italy becomes part of the European Union.
about 476	about 1350	1870	1922	1940	1946	1993
	The Renaissance begins in Italy's city-states.		Fascist leader Benito Mussolini comes to power.		The Italian Republic is founded.	

In the 1800s three men began to fight against the foreign rulers. Their names were Giuseppe Mazzini, Giuseppe Garibaldi, and Camillo Cavour. They forced the rulers to leave. They then brought all the parts of Italy together as one country. By 1861 most of Italy was united under Victor Emmanuel II, who became king. The pope still controlled Rome, but in 1870 Italian troops invaded the city and took control. This completed the unification of Italy.

Mussolini and World War II

Italy joined the Allies—Russia, France, and Great Britain—during World War I (1914–18). After the war Italians were divided on many issues. Many wanted a strong leader to take charge. The dictator Benito Mussolini and his Fascist party soon rose to power. (Fascists believe that the strength of the country is all-important.) Mussolini ruled harshly. People who criticized him were imprisoned, sent far away, or killed.

Italy formed an alliance with Nazi Germany in 1936. In 1940 Mussolini brought Italy into World War II on Germany's side. When the Allies invaded Italy in 1943, Mussolini escaped. Italy surrendered to the Allies and then joined the war against Germany.

Postwar Italy

After the war, in 1946, the Italian people voted to make the country a republic. (A republic is a country not ruled by a king or queen.) Italy developed many political parties and had more than 50 changes in government by the 21st century. Nevertheless, the economy grew to be one of the strongest in the world. Italy was a founding member of the European Economic Community, which became the European Union in 1993.

Ivan IV

Ivan IV ruled the country of Russia from 1533 to 1584. In 1547 he became Russia's first tsar. The tsar was the country's highest leader at that time. Although Ivan made improvements to his country during his reign, he is remembered mostly for his cruelty. He is also called Ivan the Terrible.

Ivan was born in 1530 to Grand Prince Vasily III of Moscow and his second wife, Yelena Glinskaya. On December 4, 1533, Ivan's father died. The 3-year-old Ivan then became grand prince of Moscow. Ivan's mother ruled for him until her death in 1538.

As Russia's leader, Ivan hoped to make the country more powerful. He created new laws and reorganized the government. He also improved the military and encouraged the development of Russian culture. But he mistreated many people who opposed him. He had more than 3,000 people killed. He even struck and killed his son Ivan. After Ivan IV died in 1584, his son Fyodor became tsar.

Ivory Coast

► see Côte d'Ivoire.

Ivy

Ivy is a vine that is known for clinging to walls and trees. It grows in cool, moist regions. There are several types of ivy, but the most common is English ivy.

Ivy is native to Europe, Asia, and North Africa. Many varieties of ivy have been introduced throughout the world.

Ivy clings to walls and trees with disks that grow from the stems. As the stems reach the top of their support, they either grow to the side or hang. Leaves with three to five sections grow from the stems. Ivy does not harm trees as long as the plant is not allowed to grow too much. If it does grow wildly, it may strangle the tree. Ivy is also used as a ground cover beneath large trees where grass has difficulty growing. It is also a popular houseplant.

Some ivy growing on brick walls can be good. It encourages dryness and warmth. It also protects the wall from bad weather and adds beauty. However, if the ivy starts growing through cracks in the wall, the wall may be damaged.

Several other plants are called ivy though they are not related to the true ivies. These include poison ivy and Virginia creeper.

Ivy often covers brick buildings.

Jackal

Jackals are wolflike animals that are related to dogs. At night jackals howl to communicate with each other. The howl can be quite bothersome to humans. People often describe the noise as sounding like loud crying or a siren.

There are three species, or types, of jackal. The golden jackal is found from eastern Europe and North Africa to southern Asia. The black-backed jackal and the side-striped jackal are found in southern and eastern Africa. Jackals live in open spaces such as grasslands.

An adult jackal is about 3 feet (1 meter) long, including the tail. It weighs about 15–24 pounds (7–11 kilograms). A jackal's fur color depends on what species it is. The golden jackal is usually yellow to pale gold. The black-backed jackal is rusty red with a black back. The side-striped jackal is grayish with a white-tipped tail and a stripe on each side of the body.

Jackals live alone, in pairs, or in groups called packs. They hide during the day

Black-backed jackals are widespread in southern Africa.

and come out at dusk to hunt. They eat small animals and plants. Packs of jackals can catch sheep and antelope. Jackals also follow lions that are hunting. Once the lion has eaten and gone, the jackals move in and eat the scraps that are left.

Jackson

Population
(2000 census)
184,256;
(2007 estimate)
175,710

Jackson is the capital of the U.S. state of Mississippi. It is the state's largest city. It lies along the Pearl River.

Jackson is a center of manufacturing and transportation. Goods made in the surrounding areas are shipped out from Jackson. Many residents work for the government or in communications.

A French Canadian named Louis Le Fleur built a trading post on the site of Jackson in 1792. It was called Le Fleur's Bluff. In 1822 it became the capital of Mississippi. It was then renamed after Andrew Jackson, the seventh president of the United States.

During the American Civil War, Union troops burned down Jackson. The city

The state Capitol in Jackson, Mississippi, is nestled between high-rise buildings.

then became known as Chimneyville. Jackson recovered slowly after the war. It grew rapidly during the 1900s.

Mississippi

Jackson, Andrew

Andrew Jackson was the seventh president of the United States.

Known as Old Hickory, Andrew Jackson served two terms as the seventh president of the United States. Jackson was

the first president to have grown up poor and on the western frontier. He made the presidency more powerful and helped to found the Democratic Party.

Early Life and Career

Andrew Jackson was born on March 15, 1767, in the western Carolinas, probably in what is now South Carolina. A few days before Andrew was born, his father died. His mother and two brothers died during the American Revolution.

Jackson studied law at an office in Salisbury, North Carolina. After 1788 he worked as a lawyer in a what later became Tennessee. Jackson married Rachel Donelson Robards in 1791. They later adopted Robards' nephew and named him Andrew Jackson, Jr.

In 1796 Jackson helped write the constitution for the new state of Tennessee. The state's voters elected him as their first representative to the U.S. House of Representatives. In 1797–98 he served as a U.S. senator. Jackson then became a judge for the highest court in Tennessee.

Military Career

In 1802 Jackson became major general of the Tennessee militia. During the War of 1812 with Great Britain Jackson fought the Creek Indians, who were British allies. He defeated them in the battle of Horseshoe Bend, in Alabama. Jackson later forced the British to leave New Orleans, Louisiana. He became a national hero.

Did You Know?

Neither Jackson nor the British knew that the War of 1812 was officially over when they fought the battle of New Orleans.

After the war Jackson went to the Alabama-Georgia region. He was supposed to defend settlers against attacks by Seminole Indians from Florida. In 1818, without orders, he led his troops to Florida, which belonged to Spain. The next year, Spain agreed to give up Florida.

Presidential Elections

In 1823 Jackson returned to the Senate. The next year he ran against three other candidates for president. Jackson won the highest number of votes but not a majority. The decision went to the House of Representatives, which chose John Quincy Adams.

Jackson ran for the presidency again in 1828. His war record and background attracted voters. They saw him as a man of the people, not a rich politician from the East. With the support of the western states, Jackson defeated President Adams. Jackson's supporters formed the

new Democratic Party, which helped him win a second term in 1832.

Presidency

Jackson relied on the advice of some of the journalists and politicians who had helped elect him. That informal group came to be known as his “kitchen cabinet.” (The Cabinet is the president's official group of advisers.)

As president, Jackson ended the powerful Bank of the United States. He also strengthened the central government by opposing the rights of states to make their own decisions in certain cases. When South Carolina threatened to ignore a federal law, Jackson said he would send soldiers to enforce it.

In another case, however, Jackson allowed Georgia to ignore the U.S. Supreme Court. The state had taken lands from the Cherokee people. The Supreme Court ruled against Georgia, but Jackson did nothing to enforce the

Jackson, Jesse

Jesse Jackson

Jesse Jackson fought for the rights of African Americans during the civil rights movement of the 1960s. Later on he became involved in politics and world affairs.

Jesse Jackson was born on October 8, 1941, in Greenville, South Carolina. He

went to college at the University of Illinois and at North Carolina Agricultural and Technical College. Then he studied religion in Chicago, Illinois. In 1968 he became a Baptist minister.

Jackson joined the civil rights movement while he was a student. In 1965 he began working for the Southern Christian Leadership Conference (SCLC). The SCLC was a civil rights group led by Martin Luther King, Jr.

In 1971 Jackson founded the group People United to Save [or Serve] Humanity (PUSH). This group helped African Americans to get jobs and to open businesses. In 1984 Jackson founded the National Rainbow Coalition to help all kinds of people, not just African Americans. (These two groups joined in 1996 to form the Rainbow/PUSH Coalition.)

Jackson ran for U.S. president as a Democrat in 1984 and 1988. He did not win. But he did better than any African American presidential candidate who had come before.

Jackson also gained a lot of attention for his role in world affairs. He spoke out against apartheid (separation of the races) in South Africa. He took part in peace talks in the Middle East. He also worked with several countries to free U.S. citizens being held as prisoners.

Did You Know?

In 1990 Washington, D.C., residents elected Jackson as a "statehood senator." His job was to try to get statehood for the city.

Jaguar

The jaguar is the largest cat that lives in the Americas. It is found mainly in the Amazon rain forest of South America. The scientific name of the jaguar is *Panthera onca*.

The jaguar looks much like the leopard. But the jaguar is larger and has bigger black spots. The average jaguar is between 5 and 6 feet (1.5 and 1.8 meters) long, not including the tail. Males weigh between 220 and 350 pounds (100 and 160 kilograms). Females are usually smaller. The jaguar has a large head and big legs. Its coat ranges from deep yellow to golden brown.

The jaguar hunts alone at night. It is a swift animal that climbs and swims well. The jaguar preys on piglike animals called peccaries. It also eats rodents, deer, birds, crocodiles, and fish.

The jaguar once lived in forests ranging from the southern United States to

The jaguar gets its name from the American Indian word *yaguar*, meaning "he who kills with one leap."

Argentina. Today there are far fewer jaguars scattered over a much smaller area. Some of the forests have been destroyed. The animals therefore have fewer places to live. People hunt jaguars for sport and for their fur. People also kill jaguars because the animals sometimes eat cattle.

Jainism

Along with Hinduism and Buddhism, Jainism is one of the three major religions that started in ancient India. Its followers are called Jains. In the early 21st century there were more than 4 million Jains, most of them in India.

Jains believe that after people die, they are reborn as other beings. By purifying their souls, they believe, they can eventually free themselves from repeated rebirth. Jains believe that 24 men, the Tirthankaras (saviors), have escaped rebirth.

For Jains, purifying the soul involves practicing ahimsa, or nonviolence. This means that they should not harm any living thing, including humans, animals, and insects. Also, Jains believe that no group of people is above or below any other group.

Jain people in India celebrate a festival by pouring holy water over a statue.

To avoid harming living things, Jains do not eat any meat. In temples and at shrines they pay respect to the 24 Tirthankaras. At certain times they fast, or refuse to eat, to help purify the soul. Jain monks and nuns follow Jainism more strictly. They dedicate their lives to purifying their souls.

Jainism began during the 600s–400s BC in eastern India. Hinduism was the main religion there. But some people rejected certain Hindu beliefs, including the idea that only the highest group of people could perform religious ceremonies. Some of these opponents of Hinduism founded Jainism.

Jains believe their religion started with the 24 Tirthankaras. Mahavira, who probably lived in the 500s or 400s BC, was the last savior. Mahavira taught people how to purify their souls. He

converted many Hindus to his ideas, later called Jainism.

Jakarta

Population
(2005 estimate)
8,603,349

Jakarta is the capital of Indonesia, a country of Southeast Asia. It is one of the largest cities in the world. Jakarta is located on the coast of the island of Java.

Jakarta is a major center of education, industry, banking, and trade. It is the country's largest port. Its factories make soap, cloth, food, and machines.

Jakarta was founded in 1527 after a local ruler defeated Portuguese troops there. He called the city Jayakarta, meaning "glorious fortress."

Dutch traders captured and destroyed the city in 1619. They then built their own town, named Batavia, there. It became the capital of the Dutch government in Indonesia.

Indonesia became an independent country in 1949. The city was renamed Djakarta, and it became the capital. In 1972 the city was renamed Jakarta.

Jamaica

Jamaica is part of the West Indies in the Caribbean Sea. Jamaica is known for reggae, a type of music. The capital is Kingston.

Geography

Jamaica lies south of Cuba and west of Haiti. The island is mountainous with plains along the coast. Jamaica has warm weather year-round. Hurricanes sometimes cause severe destruction.

Plants and Animals

Ebony, mahogany, and rosewood trees grow in some valleys. Other plants include bamboo, orchids, and ferns.

Jamaica is home to birds, bats, frogs, and crocodiles.

People

Most of Jamaica's people are of African origin. A smaller group has mixed African and European roots. There are also small numbers of East Indians, Chinese, and whites. Most people speak English

Many people visit Jamaica for its beautiful beaches and mild weather.

or Jamaican Creole. More than half of Jamaicans live in cities.

Economy

Jamaica's economy is based mainly on services, especially tourism. Mines provide the mineral bauxite, from which aluminum is made. Factories make cement, processed foods, and clothing. Farmers grow sugarcane to make raw sugar, molasses, and rum. Other crops are citrus fruits, bananas, and coffee.

History

The Arawak people lived on the island when Christopher Columbus sighted it in 1494. The Spanish took control in the early 1500s and enslaved many Arawak. The British seized Jamaica in 1655. They brought in Africans to work as slaves on sugar plantations. Jamaica gained independence in 1962.

Jamestown

Jamestown was the first permanent English colony in North America. It was located on a piece of land in the James River, near what is now Williamsburg, Virginia.

The people who founded Jamestown were members of the Virginia Company of London. King James I of England gave them the right to settle along the east coast of North America. Their goal was to find ways to make money.

The 105 colonists, all men, arrived in North America in May 1607. Life in the colony was hard. Many colonists died from illness and lack of food.

Conditions in Jamestown improved under the leadership of Captain John Smith. Under his direction, the colonists built houses and forts and dug a well. They also fished and planted crops. After being injured, Smith returned to England in the autumn of 1609.

The Native Americans of the region, called the Powhatan confederacy, sometimes gave the colonists food. But the two groups did not always trust each other.

After Smith left, the Native Americans stopped sharing food with the colonists. They also attacked colonists who left Jamestown. As a result more than 80 percent of the colonists died during the winter of 1609–10. This period was called the Starving Time.

The first colonists built Jamestown on a marshy piece of land on the James River.

More colonists arrived in 1610. In 1612 a colonist named John Rolfe began growing tobacco. The colonists sold tobacco to England, which helped Jamestown to survive.

In 1614 Rolfe married Pocahontas, the daughter of the chief of the Powhatan confederacy. This brought eight years of peace between the colonists and the Native Americans.

The colonists formed a democratic government in 1619. In the same year the first Africans arrived. The colonists treated Africans first as servants and later as slaves.

In 1624 Virginia became a royal colony, ruled by the king of England. Jamestown was Virginia's capital at first. In 1699 the capital was moved to Williamsburg. Today the site of Jamestown is part of Colonial National Historical Park.

Japan

The Asian country of Japan is marked by contrast between old and new. The country values its complex and ancient cultural traditions. Yet Japan is known for its powerful, modern economy and its advanced technology. Japan's capital is Tokyo.

Geography

Japan is located off the east coast of Asia. It consists of four large islands and more than 3,900 smaller islands. The islands form an arc that stretches across about 1,500 miles (2,400 kilometers). From north to south the main islands are Hokkaido, Honshu, Shikoku, and Kyushu. The largest is Honshu, which is considered the Japanese mainland.

The Pacific Ocean borders Japan's eastern shores. On the west the Sea of Japan, also called the East Sea, separates Japan from North Korea, South Korea, and

Cherry flowers surround a pagoda in Kyoto, Japan. A pagoda is a tower that may serve as a temple or a memorial.

Russia. China is to the southwest, across the East China Sea.

Mountains cover most of the land. Some mountains are active volcanoes. Mount Fuji, in central Honshu, is Japan's highest point. It is 12,388 feet (3,776 meters) high.

The southern islands are generally warmer than the northern ones. All the islands receive plenty of rain. Japan also experiences hundreds of earthquakes every year.

Plants and Animals

Forests cover a large part of Japan. The country's evergreen trees include pines, cypresses, hemlocks, cedars, firs, and spruces. Numerous broad-leaved trees include oaks, maples, ashes, birches, beeches, and poplars. Bamboo and palms grow in southern and central Japan. Cherry trees are known as sym-

bols of Japan. The Japanese plant them throughout the country. They also grow wild in the mountains.

Many animals live in the forested mountains. Mammals include bears, foxes, deer, wild boars, antelope, hares, and wild monkeys. The seas are home to whales, dolphins, porpoises, and a wide variety of fish. The raising of goldfish and colorful carp is a Japanese specialty.

People

Most Japanese people share the same ethnic and cultural background. They are closely related to the other peoples of East Asia. One group of Japanese, the *burakumin* (people of the village), often live in poorer conditions than other Japanese. Their ancestors belonged to the lowest class in traditional Japanese society. Koreans form the largest minority group. There are also small numbers of Ainu, a native people of northern Japan.

Japanese Kabuki plays are colorful combinations of singing, dancing, mime, and drama.

The country's main language is Japanese. Shinto and Buddhism are the major religions. Most Japanese live in cities, mainly on Honshu.

Economy

Most Japanese work in services, including banking, health care, and communications. Manufacturing and international trade are also strong parts of the economy. Japan is a leading maker of ships, automobiles, watches, and electronics—especially cellular phones, television sets, computers, cameras, photocopiers, and robots. Japan also produces steel, chemicals, plastics, cement, fabrics, and paper.

Farming and fishing are small parts of the economy. Nevertheless, Japan produces large amounts of food. Its leading crops include rice, potatoes, sugar beets, fruits, vegetables, and tea. Japan also catches more fish than most other countries do.

History

People lived in Japan at least 10,000 years ago. According to legend, the emperor Jimmu founded the Japanese state in 660 BC. Historical records, however, show that Japan was not united as one state until the late AD 300s or early 400s.

For many centuries the Japanese borrowed heavily from Chinese culture. The Japanese adopted Chinese characters to write the Japanese language. They also used some Chinese ideas about government. Japan's culture became more Japanese after the 800s.

TIMELINE

Japan becomes a unified kingdom.		Japan bans its people from traveling overseas.		The Japanese attack Pearl Harbor, Hawaii.		Junichiro Koizumi becomes Japan's 87th prime minister.
about 400	1192	1635	1868	1941	1945	2001
	The samurai set up a military government, or shogunate.		The emperor Meiji takes power and modernizes Japan.		The United States drops atomic bombs on Japan.	

Military Government

During the 1100s a class of warriors called samurai rose to power. The samurai often managed the estates of wealthy people, and sometimes they held land themselves. The samurai developed advanced military skills.

In 1185 a samurai named Minamoto Yoritomo took control of Japan. In 1192 he took the title of shogun. His military government was called a shogunate. Japan had an emperor, but he held less power than the shogun.

From the 1300s to the 1500s powerful families fought each other for control of Japan. The country was divided into private estates ruled by the landowners. The shogun and the emperor became less powerful.

Meanwhile Japan was developing trade contacts with the outside world. Trade missions to China began in 1404. In

1543 Portuguese traders arrived in Japan. Spanish, English, and Dutch traders followed.

The division and disorder in Japan ended in the late 1500s. Powerful leaders defeated the local landowners and united the country.

During the 1600s and 1700s strong shoguns of the Tokugawa family ruled Japan. Japan enjoyed peace, stability, and a growing economy. At the same time, the shoguns began to fear conquest by foreign powers. They banned Christianity (a foreign religion), stopped foreign travel, and cut back on foreign trade.

By the mid-1800s the Tokugawa shogunate was unable to keep European and U.S. traders away. The shogun's support among the Japanese people collapsed. In 1868 the shogun was forced to step down.

The Japanese Empire

Japan set up a new government under an emperor who took the name Meiji, meaning “enlightened government.” The transfer of power from the shogunate to the Meiji emperor was the start of Japan’s modern era.

Japan soon started to build an empire. It defeated China and Russia in war. It made Korea into a Japanese colony in 1910. During World War I (1914–18), Japan fought on the side of the Allies (mainly Great Britain, France, and Russia). Japan seized additional territory in East Asia during the war.

World War II

In 1931 Japan seized the region called Manchuria from China. Japan moved troops into China in 1937 and into Southeast Asia in 1940. The Japanese also formed an alliance with Germany and Italy. The three countries were known as the Axis powers. They fought against the Allies during World War II (1939–45).

Crowds of people cross a street in a busy Japanese city. Japan has many large cities.

In 1941 Japan attacked U.S. forces at Pearl Harbor, Hawaii. The attack pulled the United States into the war. In 1945 the United States dropped atomic bombs on the Japanese cities of Hiroshima and Nagasaki. The bombs destroyed large parts of the cities and killed more than 100,000 people. The Japanese then surrendered.

Postwar Japan

After the war Japan had to give up all the territory it had acquired since 1895. It also broke up its military. In addition, U.S. forces occupied Japan until 1952. A new constitution in 1947 took power away from the emperor and made Japan more democratic.

Japan rebuilt its ruined economy with the help of new technology. By 1990 Japan had one of the world’s largest economies. Although economic growth slowed in the 1990s, Japan remained one of the richest countries in the world.

Girls wear traditional clothing at a festival in Kanazawa, Japan. Many Japanese cities, towns, and temples hold local festivals.

Jazz

Jazz is a type of music. It began among African Americans. Today jazz is popular all over the world.

Features

There are many different kinds of jazz music. But most jazz is at least partly improvised. This means that a jazz musician composes (makes up) the music while playing it, rather than beforehand.

Jazz bands can have many different types of instruments. They often feature drums, piano, bass, trumpet, trombone, and saxophone. Jazz often includes singers, too.

History

In the 1700s and 1800s enslaved people from Africa brought their music to the United States. Jazz grew from a mix of African and European music. Ragtime, a form of piano music, and blues music also influenced jazz.

The Preservation Hall Jazz Band performs in New Orleans, Louisiana.

New Orleans, Louisiana, is often called the home of jazz. Many important early jazz musicians, such as pianist Jelly Roll Morton, were from New Orleans. In 1917 the Original Dixieland Jass Band, a New Orleans band, made the first jazz recording.

In about 1918 many musicians from New Orleans began heading north. Chicago, Illinois, quickly became the jazz capital of the United States. New York City became an important center for jazz, too.

Louis Armstrong was an important jazz musician from this time. Armstrong's style of jazz became known as swing. It was popular throughout the 1930s and 1940s. Other famous swing musicians included orchestra leader Benny Goodman and singer Billie Holiday.

Another popular type of jazz music was called big-band jazz. Large orchestras with many musicians played this kind of jazz. Duke Ellington was a famous jazz musician, composer, and big-band leader. Count Basie was another well-known bandleader.

Jazz music continued to grow and change throughout the 1950s and 1960s. Some famous jazz musicians from this time include saxophonist Charlie Parker and trumpeter Miles Davis.

During the 1970s and 1980s musicians from many countries created new kinds of jazz. The result was fusion music.

This kind of music combined jazz, rock, and Latin American music.

Armstrong, Louis • Blues • Music

Jefferson, Thomas

Thomas Jefferson was the third president of the United States.

Thomas Jefferson was the chief author of the Declaration of Independence and the third president of the United States. Many people praise Jefferson as someone who believed strongly in the ideas of democracy, equality, and freedom. At the same time, however, he owned slaves, and that has caused some people to question his beliefs.

Early Life

Thomas Jefferson was born on April 13, 1743, in Shadwell, Virginia. His parents

were Peter Jefferson, a land surveyor, and Jane Randolph, a member of a rich family. The Jeffersons lived on a plantation with slaves. Jefferson studied at a boarding school and at William and Mary College in Williamsburg, Virginia. In 1767 he became a lawyer. The next year he designed his own home, named Monticello, near Shadwell.

Jefferson married Martha Wayles Skelton on New Year's Day in 1772. They had six children. Skelton died after 10 years of marriage, and Jefferson never remarried.

Political Career

Jefferson was elected to the Virginia legislature in 1769. He became a strong supporter of American independence from Great Britain. He served as Virginia's delegate to the Continental Congress in 1775 and 1776. In 1776 he was the main author of the Declaration of Independence. He wrote the famous lines that said "all men are created equal" and have the rights of "life, liberty and the pursuit of happiness."

Jefferson then returned to the Virginia legislature. There he proposed ending the privileges of the wealthy, making education available to all citizens, and separating church and state. In 1779 Jefferson was elected governor of Virginia. Many criticized him for not defending the state from a British attack in 1780. In 1782 Jefferson reentered the Continental Congress. After the American Revolution ended, he replaced Benjamin Franklin as U.S. minister to France.

Did You Know?

Thomas Jefferson and John Adams both died on the same day—the 50th anniversary of U.S. independence.

TIMELINE

Jefferson is born in Shadwell, Virginia.

April 13, 1743

Jefferson is elected vice president under President John Adams.

1796

The Louisiana Purchase doubles the size of the United States.

1803

Jefferson dies at his home near Charlottesville, Virginia.

July 4, 1826

Jefferson writes the Declaration of Independence.

1776

Jefferson is elected president.

1800

Jefferson retires after a second term.

1809

During 1790–93 Jefferson was the first U.S. secretary of state, under President George Washington. Jefferson clashed with Alexander Hamilton, the secretary of the treasury. Jefferson and his supporters, called Republicans (or Democratic-Republicans), believed that the states should have the power to make their own decisions in most matters. Hamilton led the Federalists, who believed in a powerful central government. In 1796 Jefferson was elected vice president under President John Adams.

Presidency

In 1800 Jefferson and Aaron Burr ran for president against President Adams. Jefferson and Burr received the same number of electoral votes. The House of Representatives eventually chose Jefferson as the winner.

The most important event of Jefferson's first term was the purchase of a large

area of land known as the Louisiana Territory from France in 1803. The territory doubled the size of the United States. The president launched the Lewis and Clark Expedition to explore the new territory. Jefferson easily won reelection in 1804, but his second term was less successful than the first. A war between Britain and France hurt U.S. trade with Europe.

Retirement

In 1809 Jefferson retired to Monticello, where he wrote, looked after his estate, and entertained friends. His last great project was founding the University of Virginia at Charlottesville. Jefferson died on July 4, 1826.

Jefferson City is the capital of the U.S. state of Missouri. The city is located on the Missouri River.

Farmers from the surrounding area sell crops and livestock in Jefferson City. Many people in the city work for the government or in health care or education. Factories in Jefferson City make shoes, books, electrical appliances, and food products.

The city began as a small settlement called Lohman's Landing. In 1821 the settlement was selected as the site for the capital of Missouri. A son of the famous American pioneer Daniel Boone laid out

the city in 1822. It was named after Thomas Jefferson, the third president of the United States. Jefferson City officially became the state capital in 1826.

Jellyfish

Jellyfish are sea animals with a soft, jelly-like body and no bones. They have tentacles, or feelers, that they use to sting their prey. Sometimes they sting swimming people, too.

Jellyfish are related to corals and sea anemones. There are about 200 species, or types, of jellyfish. They are found in all oceans. Most live at or near the surface of the water.

A typical jellyfish is shaped like a bell or an umbrella. Some jellyfish are hardly large enough to be seen. Others are more than 6 feet (2 meters) across. Jellyfish can be transparent (see-through), white, brown, pink, blue, or maroon. Some jellyfish have eyes around the edge of the body. The mouth and stomach are in the middle of the body.

A jellyfish may have a few or many tentacles. Thin tentacles run around the edge of the body. Four or more larger tentacles hang down from the middle of the body, below the mouth. The tentacles are lined with stinging cells that make poison. The poison can stun small animals. The tentacles then pull the animals into the mouth.

Did You Know?

Jellyfish are not fish. They are a much simpler form of living thing.

Tourists leave the Governor's Mansion in Jefferson City, Missouri.

Jellyfish swim by opening and closing their bodies like an umbrella.

Certain jellyfish can be very dangerous to humans. Even a small sting from the jellyfish called sea wasps can kill a person within a few minutes.

Jemison, Mae

Mae Jemison was the first African American woman to become an astronaut. She was a part of the crew of the space shuttle *Endeavor*, which orbited Earth for more than a week in 1992.

Jemison was born on October 17, 1956, in Decatur, Alabama. She was the youngest of three children. When she was 3, the family moved to Chicago, Illinois. Even as a young girl Jemison was deeply interested in science.

Jemison graduated from high school at age 16. She then received a scholarship to attend Stanford University in California. She graduated from there in 1977 with a degree in chemical engineering.

After Stanford, Jemison attended medical school at Cornell University in New York. She received her medical degree in 1981. She worked as a doctor first in Los Angeles, California, and then with the Peace Corps in West Africa.

Then Jemison applied to the National Aeronautics and Space Administration (NASA) to become an astronaut. She was one of only 15 out of 2,000 applicants accepted by NASA. Jemison entered NASA's astronaut program in 1987. In 1992 Jemison flew aboard the shuttle *Endeavor* as the science mission specialist. At the time she was the only female African American astronaut.

After retiring from NASA in 1993, Jemison founded her own company, the Jemison Group. The company created new technologies, especially to help developing countries. Jemison also cre-

Jerusalem

Jerusalem is an ancient city in the Middle East. Three major religions—Judaism, Christianity, and Islam—regard the city as holy. In modern times the country of Israel and the Palestinian Arabs have fought for control of Jerusalem. Israel claims the city as its capital. However, the Palestinians have protested that claim.

Major Holy Sites

The part of Jerusalem called the Old City has many important religious sites. Jews consider the Western Wall to be a holy place of prayer. It is all that remains of the Second Temple of Jerusalem, which was destroyed in ancient times.

Christians consider Jerusalem holy because of its connections with Jesus. The Church of the Holy Sepulchre is in Jerusalem. Christians built it over the

Jews pray at the Western Wall in the Old City of Jerusalem. Behind the Western Wall is the Dome of the Rock.

place where they believe Jesus was killed, buried, and then raised from the dead.

The holiest Muslim site in Jerusalem is a monument called the Dome of the Rock. Muslims believe it marks the place where an angel carried Muhammad, the founder of Islam, up to heaven.

Economy

Many people in Jerusalem work at jobs serving the public, such as in government, health care, or education. The city is also a center of tourism and banking. Factories in the city make electronics, processed foods, and other products.

History

People have lived in Jerusalem for at least 5,000 years. In about 1000 BC King David made Jerusalem the capital of the Jewish kingdom of Israel. The Jews built the First Temple of Jerusalem in the 900s BC. Troops from Babylonia

Did You Know?

The Old City is surrounded by a stone wall built in 1538–40. Newer parts of Jerusalem were built outside the wall.

destroyed the temple in 586 BC. They also forced many Jews to leave Jerusalem. About 50 years later the Jews returned and built the Second Temple.

Jesus was killed in Jerusalem in about AD 30. At that time Jerusalem was part of the Roman Empire. In AD 70 the Romans destroyed much of the city, including the Second Temple.

Various Muslim leaders ruled Jerusalem for most of the 600s to the early 1900s. Christian soldiers called Crusaders captured the city a few times during the 1000s to 1200s.

In 1948 the country of Israel was created. The United Nations was supposed to rule Jerusalem as an international city. However, war broke out. During the fighting the country now called Jordan captured Jerusalem's eastern section. Israel captured Jerusalem's western section. Israel took control of the entire city in 1967.

Jesus Christ

The teachings of Jesus, or Jesus Christ, are the basis of Christianity. Christians believe that Jesus was the Messiah—a savior sent to deliver people from sin. The word Christ comes from *Khristos*, the Greek word for Messiah.

A painting shows an artist's idea of what Jesus looked like. The halo around Jesus' head is a symbol of holiness.

Early Life

Nearly everything known about Jesus comes from the Bible, in the four books of the New Testament known as the Gospels. According to the Bible, the angel Gabriel visited a woman named Mary and told her she would give birth to the Son of God. Her son, Jesus, was born in about 6 BC in Bethlehem, a city in the Middle Eastern region of Palestine. Mary and her husband, Joseph, were from Nazareth, and that is where Jesus grew up.

Ministry

Jesus began preaching when he was about 30 years old. He gathered a group of 12 followers, or disciples, called the apostles, who helped him spread his message. Jesus was a Jew, and many of his teachings grew out of Judaism. He taught people to forgive others, to live a good life, and to honor God so as to

enter God's kingdom. He often taught by using parables, or short stories that illustrated his message. The Gospels also describe various miracles he performed, such as raising the dead, turning water into wine, and healing the sick. Jesus attracted many followers.

Opposition to His Ministry

Jesus welcomed all types of people, even those whom Jewish religious leaders considered to be sinners. Some religious leaders thought that Jesus' teaching was wrong and that it was leading people astray. Others feared that he might start a political uprising and that this would lead to great trouble.

Death and Resurrection

Jesus knew that opposition to him was growing and that one of his disciples, Judas Iscariot, was turning against him. Jesus gathered the apostles together for a meal, later known as the Last Supper. He told them that his death was necessary because it would establish a new bond between God and humans. Jesus took bread and wine, blessed them, and shared them with his disciples. Christians remember this in a ceremony known as Holy Communion or the Lord's Supper.

Later that night, Judas brought men to arrest Jesus, and Jesus was sentenced to death. He was crucified, or nailed to a cross. He died on the cross and was buried nearby.

On the third day after that, a group of women went to Jesus' tomb and found the body gone. The Gospels tell that

Jesus then appeared to one of the women, Mary Magdalene, and to the disciples. He spent 40 days on Earth after his Resurrection, or return from the dead, and then was taken up to heaven.

The story of Jesus' Resurrection is central to Christian belief. His apostles continued to teach his message after his death, and as that message spread, Christianity was born.

Jewelry and Gems

Jewelry is any object other than clothes that is worn to decorate the body. People use many different materials in making jewelry. Fine jewelry is made of valuable

A girl wears a necklace made of beads and shells.

metals, such as gold and silver, and beautiful stones called gems. Jewelry that is made of plastic, steel, ceramics, glass, or other less costly materials is called costume jewelry. People who still live as their ancient ancestors did make jewelry from bone, claws, animal hair, wood, and shells.

The Importance of Jewelry

People wear jewelry for many reasons. Kings, queens, and other leaders have often worn fine jewelry at important ceremonies and events. Some people wear jewelry for religious reasons. Many people wear jewelry to mark an important life event. For example, many men and women give each other rings at their weddings.

Types of Gems

Most gems are hard minerals that are found naturally in the earth. However, a few gems come from animals or plants. Pearls form inside the shells of oysters, clams, and other animals called

Some pearls form naturally inside the shells of mollusks. Other pearls, called cultured pearls, form after people stick beads or other tiny objects inside a mollusk's shell.

mollusks. Amber is tree sap that has fossilized, or turned to stone. Jet is a hard form of brown coal, which is made from fossilized plants. Coral comes from the skeletons of sea animals called corals.

The color of gems ranges from colorless to pure black. Gems may be transparent (see-through) or opaque, which means that light cannot shine through them.

Among the rarest and most valuable gems are diamonds, rubies, emeralds, and sapphires. These gems are all transparent minerals. Diamonds may be yellow, pink, blue, or black. Rubies are red, and emeralds are green. Sapphires may be blue, violet, yellow, green, or almost black.

Other valuable gems include jade, carnelian, and lapis lazuli. These gems are opaque. Jade is usually green, but it can also be pink, white, or lavender. Carnelian is red or reddish brown. Lapis lazuli is blue with gold-colored flecks in it.

The crown of Queen Victoria, who ruled the United Kingdom from 1837 to 1901, is filled with diamonds.

History

People have been making jewelry for tens of thousands of years. Ancient peoples made jewelry from teeth and animal bones. People began making jewelry from gold more than 4,000 years ago. In ancient times and in the Middle Ages people shaped and polished gems to make them round and shiny. In the 1400s people discovered how to cut gems to give them many flat surfaces called facets. Facets make gems sparkle. In the 1800s people learned how to make artificial, or fake, gems.

Joan of Arc

Joan of Arc is a national heroine of France. Born a peasant, she became a military leader while just a teenager.

Joan of Arc was born in Domrémy, France, probably in 1412. At the time France and England were fighting the Hundred Years' War. Reims, the city where French kings traditionally were crowned, was in enemy hands. As a teenager Joan claimed that the voices of saints commanded her to drive the English out of northern France. Charles VII, heir to the French throne, could then be crowned king in Reims.

Joan traveled far to visit Charles at his castle. Some of Charles's advisers were suspicious of her. Church officials thought she might be a witch. They asked her many questions. Finally they advised Charles to use Joan's services.

Joan inspired the French troops with her great spirit. In 1429 she led them to victory over the English in a battle in the French city of Orléans. The army then entered Reims. Joan stood beside Charles VII as he was crowned king.

Joan fought other battles, too. In 1430 she got separated from her soldiers and was forced to surrender. The English put her on trial. She was charged with witchcraft and other crimes against the church. She had to confess to wrongdoing or be put to death.

Joan confessed but then changed her mind. She said that saints had criticized her for confessing. On May 30, 1431, she was burned to death at the stake. She was just 19 years old. Years later a church court canceled the judgment

Joan of Arc watched as Charles VII was crowned king of France in 1429.

against Joan. In 1920 the Roman Catholic church made Joan a saint.

Johnson, Andrew

Andrew Johnson became president of the United States in 1865, when Abraham Lincoln was assassinated. Johnson's biggest challenge was the rebuilding of the Southern states, which had just lost the American Civil War.

Early Life

Andrew Johnson was born in Raleigh, North Carolina, on December 29, 1808. His father, Jacob Johnson, died when Andrew was young. His mother, Mary McDonough Johnson, worked as a spinner and a weaver.

In 1826 the poor family moved to Greeneville, Tennessee, where Johnson opened a tailor shop. At age 18 he mar-

Andrew Johnson was the 17th president of the United States.

ried Eliza McCardle. The couple had five children.

Political Career

Johnson served as mayor of Greeneville. In 1835 he entered the Tennessee legislature. In 1843 he began the first of five terms in the U.S. House of Representa-

TIMELINE

1869

tives. Afterward he served two terms as governor of Tennessee. In 1857 he entered the U.S. Senate.

After Abraham Lincoln became president in 1860, Johnson was the only Southern senator who did not resign in protest. Many people in the South disagreed with Lincoln over the issue of slavery. They were afraid that Lincoln would try to end slavery. This soon led to the Civil War. Johnson, however, sided with the Union, not the Southern states. Lincoln appointed him military governor of Tennessee in 1862.

Johnson was a Democrat, but in the 1864 election the Republicans chose him to run as Lincoln's vice president. The party hoped to win the votes of Democrats who supported the Union. Lincoln and Johnson won easily.

Presidency

When Lincoln was assassinated on April 14, 1865, Johnson became president. The Civil War was over, and Johnson had to rebuild the Union—a process called Reconstruction. He spent much of his term struggling with the Republicans in Congress.

The Republicans set harsh rules for letting Southern states back into the Union. They also wanted to ensure civil rights for freed slaves. Johnson did not want to punish the South or give blacks the right to vote. He vetoed, or rejected, Congress's acts. However, Congress overrode the vetoes, or passed the acts with a large majority of votes.

Congress also passed a law preventing the president from firing government officers. When Johnson fired his secretary of war, the House of Representatives voted to impeach Johnson (put him on trial) for breaking the law. Johnson was the first U.S. president to be impeached. The Senate found Johnson not guilty.

Last Years

Johnson left office in 1869 and returned to Tennessee. In 1875 he reentered the U.S. Senate. He died soon afterward, on July 31, 1875.

Johnson, Jack

Jack Johnson was the first African American to win the heavyweight boxing championship of the world. He was famous during a time of great uneasiness

Jack Johnson

between blacks and whites. Many white people hated Johnson for being successful. They criticized him unfairly.

John Arthur (Jack) Johnson was born in Galveston, Texas, on March 31, 1878. He dropped out of school after the fifth grade. He began boxing professionally in 1897.

Johnson won the heavyweight title in 1908. He defeated Tommy Burns in a fight in Australia. Johnson lost the title in 1915, when Jess Willard knocked him out after 26 rounds.

Johnson's professional career lasted until 1928. In that time he fought more than 100 matches. He was knocked out only three times.

In 1912 Johnson broke a law by crossing a state line with his bride before they were married. He was sentenced to a year in prison. To avoid jail, he fled to Canada disguised as a member of a black baseball team. Johnson returned to serve his sentence in 1920.

After his release from prison, Johnson boxed sometimes. He also performed in carnival acts. He eventually owned his own supper club.

On June 10, 1946, Johnson was killed in an automobile accident in Raleigh, North Carolina. He was inducted into the Boxing Hall of Fame in 1954.

Johnson, Lyndon B.

Lyndon B. Johnson was the 36th president of the United States.

Lyndon B. Johnson became president of the United States in 1963, when John F. Kennedy was assassinated. During his presidency Johnson introduced important social laws, including a civil rights bill. He is also remembered for expanding U.S. involvement in the Vietnam War.

Early Life

Lyndon Baines Johnson was born on August 27, 1908, on a farm near Stonewall, Texas. He was the oldest of five children. His father, Sam Ealy Johnson, Jr., was a businessman and a member of the Texas legislature. His mother, Rebekah Baines Johnson, was a daughter of a state legislator.

Did You Know?

Jack Johnson continued to box in non-championship matches until he was about 67 years old.

After graduating from college in 1930, Johnson taught at a Houston high school. The next year he went to Washington, D.C., as an assistant to a Democratic congressman. In 1934 Johnson married Claudia Alta Taylor, known as Lady Bird. The couple had two daughters.

Political and Military Career

In 1937 Johnson entered the U.S. House of Representatives. He joined the U.S. Navy in 1941. After fighting in World War II, Johnson was elected to the U.S. Senate in 1948. During his 12 years there he became the leader of the Democratic senators. He had a heart attack in 1955 but soon went back to work.

Presidency

In 1960 Johnson ran for vice president under the Democrat John F. Kennedy. The Republican presidential candidate was Richard M. Nixon. Johnson's influence in the South helped the Democrats

to win. On November 22, 1963, Kennedy was assassinated in Dallas, Texas. Johnson was sworn in as president that afternoon.

Johnson helped to calm the mourning nation. He urged Congress to pass laws that Kennedy had proposed. In July 1964 Johnson signed the historic Civil Rights Act. The act's goal was to end racial discrimination.

In the presidential election of 1964 Johnson defeated Republican Barry Goldwater. In his second term Johnson continued his program of reforms called the Great Society. He signed laws to fight poverty and to improve education, medical care for the aged, and housing. In 1965 Congress passed the Voting Rights Act, which outlawed the many ways that people had tried to prevent African Americans from voting.

Despite those successes, many people criticized Johnson for sending hundreds

Johnson, Magic

Magic Johnson was a basketball player who led the Los Angeles Lakers to five National Basketball Association (NBA) championships. He was known especially for his expert passing and for his leadership on the court.

Early Life

Earvin Johnson, Jr., was born in Lansing, Michigan, on August 14, 1959. As a young boy he practiced basketball for many hours at the playground. In high school he earned the nickname Magic for his skills in handling the ball. In 1977 he helped his high school team win the state championship. Later he played for Michigan State University. He led the Michigan State Spartans to the college championship in 1979.

Magic Johnson of the Los Angeles Lakers makes a hook shot during the 1992 NBA All-Star Game.

Professional Career

That same year Johnson joined the Los Angeles Lakers. He was the team's point guard from 1979 to 1991. He was named the NBA's most valuable player six times. He also earned a gold medal as a player on the 1992 U.S. Olympic basketball team.

In 1991 Johnson found out that he had HIV. HIV is the virus that causes the disease AIDS. He left the NBA, but he returned for the 1995–96 season. In 2002 he was named to the Basketball Hall of Fame.

Beyond Basketball

In 1991 Johnson started the Magic Johnson Foundation. The foundation gives money to HIV/AIDS clinics in U.S. cities. It also builds computer centers and provides money for city chil-

dren to go to college. Johnson became part owner of the Lakers in 1994.

Jolliet, Louis

Louis Jolliet was a French-Canadian explorer and mapmaker. He and Father Jacques Marquette were the first white men to explore the upper Mississippi River in North America.

Louis Jolliet was born in about September 1645 in Beaupré, Canada. He went to France to study science. After returning to Canada, he made his living trading furs near the Great Lakes.

In 1672 the French governor in North America asked Jolliet and Marquette to explore the great river west of the Great Lakes—the Mississippi. They set out with five other men on May 17, 1673,

Louis Jolliet and Father Jacques Marquette sometimes had to portage, or carry their canoes, while exploring the Mississippi River.

in two canoes made of bark. They left from Saint Ignace in what is now the Upper Peninsula of Michigan. From Lake Michigan they entered the Fox River at Green Bay. They portaged, or carried their canoes and supplies, from the Fox to the Wisconsin River. Then they continued to the Mississippi.

In July Jolliet and Marquette reached the mouth of the Arkansas River in what is now Arkansas. The Quapaw people there told them that the river flowed into the Gulf of Mexico. The explorers had hoped that the river would take them all the way to the Pacific Ocean. Jolliet and Marquette turned back and returned by way of the Illinois River. They became the first white men to visit what is now Illinois.

Jolliet later explored Hudson Bay and some Canadian rivers. He died in the summer of 1700 near Quebec, Canada.

Jones, John Paul

John Paul Jones was a hero of the colonial navy during the American Revolution. He defeated a British ship in one of the most famous sea battles in history.

Early Life

John Paul Jones was originally named John Paul. He was born on July 6, 1747, near Kirkcudbright, Scotland. At about age 12, he began working on ships that carried goods for trade.

Did You Know?

Jolliet took notes on and drew maps of the Mississippi River. All were lost when his canoe overturned.

Career

By 1766 Paul had sailed to places as far away as North America and Jamaica. In 1768 a fever spread through the ship he was on. When the ship's commanders died, Paul took charge and brought the ship safely into port. The ship's owners quickly appointed him captain of the ship.

In 1772 Paul bought a ship in the West Indies. The following year he killed a sailor who challenged his authority. To escape trial Paul fled to North America, where he changed his name to John Paul Jones.

When the American Revolution began, the leaders of the American colonies made Jones a senior lieutenant in the Continental Navy. During the war Jones and his crew destroyed and captured many enemy ships.

In 1779 Jones fought his most famous battle—a fierce clash with the British ship *Serapis*. The battle took place off the east coast of England. The *Serapis*

John Paul Jones's ship the *Bonhomme Richard* is pictured in battle with the British ship *Serapis* on September 23, 1779.

John Paul Jones

was larger and better-armed than Jones's ship, the *Bonhomme Richard*. But when the British captain called to Jones to surrender, Jones yelled back, "I have not yet begun to fight!" After a long battle, the *Serapis* surrendered. However, the *Bonhomme Richard* was badly damaged, and it sank soon afterward. In 1787 Jones received a Congressional gold medal.

Retirement and Death

After serving briefly in Russia's navy, Jones retired to Paris, France. He died in that city on July 18, 1792. More than 100 years later, U.S. warships carried Jones's body back to the United States. He was reburied in a tomb at the U.S. Naval Academy in Annapolis, Maryland. His grave was made a national shrine.

American Revolution • Navy

Jordan

The Middle Eastern nation of Jordan is a small state with an ancient history. The country's full name is the Hashimite Kingdom of Jordan. The capital and largest city is Amman.

Geography

Jordan borders Syria, Iraq, Saudi Arabia, Israel, and the Palestinian territory of the West Bank. The Jordan River flows along Jordan's western border to the Dead Sea. Jordan has a short coastline on the Gulf of Aqaba, an arm of the Red Sea.

A fertile valley runs along the Jordan River. East of the valley are rocky highlands. Beyond the highlands is a desert, which covers more than 80 percent of Jordan's land. The country is generally dry, with hot summers and cool winters.

Plants and Animals

Banana, date palm, and citrus trees grow in the valley. The highlands have small trees, sagebrush, and grasslands. Few plants grow in the desert.

The animals found in Jordan include wild boars, hares, jackals, foxes, wildcats, hyenas, wolves, mongooses, and gazelles. Birds include golden eagles, vultures, pigeons, and partridges.

People

Most of Jordan's people are Arabs. About a third of the Arabs are Palestinians from Israel and the West Bank.

Most of the people practice Islam. There is also a small number of Christians. Arabic is the main language, but many people also speak English. About three fourths of the people live in cities.

Economy

Unlike some other countries in the Middle East, Jordan does not have much petroleum (oil) or other natural resources. The economy is based on services, including banking, government work, and tourism. Many tourists come to see the biblical cities near the Jordan River.

Manufacturing and mining are also important. Factories produce chemicals, cement, clothing, and food products. The country refines petroleum and mines potash and phosphates, which are used to make fertilizers. Limited farming produces tomatoes, olives, vegetables, and citrus fruits.

Jordan's Queen Rania visits with local children.

History

People have lived in Jordan for more than 200,000 years. Ancient Jordan was part of the area known as Palestine. Early kingdoms—including Ammon, Moab, and Edom—ruled from the 1200s BC.

Assyrians, Babylonians, Persians, Seleucids, and the Roman Empire later controlled the region. In the AD 600s Arab invaders brought Islam to the area. The Ottoman Empire ruled from the 1500s until 1918.

In 1920 Great Britain took control of what is now Jordan. The territory, then called Transjordan, gained full independence in 1946. Abdullah of the Hashimites, a powerful Arab family, became king.

Jordan soon became involved in conflicts with its neighbors. In 1948 the

country of Israel was created out of part of Palestine. Jordan joined other Arab nations in a war against Israel. A large number of Palestinians were forced out of Palestine and into Jordan.

In 1967 Jordan fought another war with Israel. Jordan lost the West Bank and the eastern part of Jerusalem to Israel. The losses increased the number of Palestinians who moved to Jordan.

Jordan began moving toward peace and stability in the 1980s. In 1988 Jordan gave up its claims to the West Bank. In 1994 Jordan signed a peace treaty with Israel. In the early 21st century Jordan continued to work for peace in the Middle East.

Jordan, Michael

Michael Jordan of the Chicago Bulls tries to slam-dunk a ball during an NBA All-Stars competition in 1987.

Michael Jordan was one of the best basketball players of all time. He led the Chicago Bulls to six National Basketball Association (NBA) championships. He was called Air Jordan because of how he soared toward the basket for spectacular slam dunks.

Early Life

Michael Jeffrey Jordan was born on February 17, 1963, in Brooklyn, New York. He grew up in Wilmington, North Carolina. In 1981 he entered the University of North Carolina at Chapel Hill. As a freshman he scored the winning basket in the 1982 college championship game. Jordan was named college basketball player of the year in 1983 and 1984. He left North Carolina after his junior year.

Olympics

Jordan led the U.S. basketball team to a gold medal at the 1984 Summer Olympic games in Los Angeles, California. In 1992 he earned another gold medal at the Summer Olympics in Barcelona, Spain. He and the other U.S. players were called the Dream Team.

Success with the Bulls

Jordan first played for the Bulls in the 1984–85 season. In 1985 he was named Rookie of the Year. With his help the Bulls won the NBA championship three years in a row, from 1991 to 1993. Jordan was named most valuable player (MVP) of each championship series.

Jordan retired from basketball in 1993 to play professional baseball. He returned to the Bulls in March 1995. Again he led the team to three NBA championships in a row, from 1996 to 1998. Jordan was the MVP of each championship series.

Washington Wizards and Retirement

Jordan retired from basketball again in 1999, but in 2001 he returned to the NBA. He played two seasons for the Washington Wizards.

Jordan retired for a third and final time in 2003. His career totals included 32,292 points, 2,514 steals, 5 MVP awards, and 10 scoring titles. He played in 13 NBA All-Star games.

Basketball

Did You Know?

Jordan helped the Bulls win 72 games in the 1995–96 season.

Jordan River

The Jordan River, in the Middle East, is the lowest river in the world. It ends in the Dead Sea, at a depth of 1,312 feet (400 meters) below sea level. The river is important to Christians, Jews, and Muslims because of its location in an area that is holy to all three.

The Jordan River is more than 223 miles (360 kilometers) long. It starts on the slopes of Mount Hermon, on the border of Lebanon and Syria. It flows southward through northern Israel to the Sea of Galilee. There the river drops sharply, to 686 feet (209 meters) below sea level.

South of the Sea of Galilee, the Jordan divides Israel and the Israeli-occupied West Bank on the west from Jordan on the east. It flows through a deep, narrow valley with steep sides. Finally it empties into the Dead Sea.

Little rain falls in the Jordan River valley. This makes the river's water very important to farmers in the region. Irrigation systems pump water from the

The distance between the beginning and end of the Jordan River is less than 124 miles (200 kilometers). Because the river winds a lot, however, its length is more than 223 miles (360 kilometers).

Judaism

The religion of the Jewish people is Judaism. Judaism has more than 14 million followers throughout the world, more than a third of whom live in the United States. Many other Jews live in Israel, a country at the eastern edge of the Mediterranean Sea.

Beliefs

Like Christianity and Islam, Judaism teaches that there is only one God and that God created the world. God

Jewish children study the teachings of their religion. Jews sometimes wear skullcaps called yarmulkes.

expressed what he expects of people in the Ten Commandments and other laws.

Jews believe that God chose them to have a special relationship with him. They must devote themselves to God and love one another because God

selected them to bring knowledge of him to the rest of the world. They believe that, in return, God has promised to make the Jews (Israel) a great nation that will eventually draw other nations together in a worldwide community of justice and peace.

The sacred book of Judaism is the Hebrew Bible. Particularly important to Judaism are the first five books, which are known as the Torah. These writings explain and interpret God’s laws. The Talmud is a collection of traditional Jewish laws along with stories and comments about those laws.

Practices

In Judaism the lives of individuals are closely connected to the larger community. The Jewish house of worship, called a synagogue, also serves as a community gathering place. Its leader is known as a rabbi. At the heart of synagogue worship is the public reading of the Torah.

An important time during each week is the Sabbath. Jews observe this period of

Some Important Jewish Holidays		
Holiday	Meaning	Date
Passover	remembrance of the early Jews’ escape from slavery in Egypt	March/April
Purim	celebration of the survival of early Jews living under the rule of the Persians	usually in March
Shavuot	remembrance of the day that God gave the Ten Commandments to Moses	50 days after Passover
Rosh Hashana	Jewish new year	September/October
Yom Kippur	day of asking forgiveness for sins	eight days after Rosh Hashana
Sukkot	festival of thanksgiving	September/October
Hanukkah	celebration of a miracle at the Second Temple of Jerusalem	usually in December
Note: Actual dates depend on the Jewish calendar.		

A Jewish service takes place inside a synagogue.

holiness and rest from sunset on Friday to nightfall on Saturday.

Divisions

Judaism has three main divisions. The most traditional is Orthodox. Orthodox Jews believe that Judaism today should be practiced just as it was in ancient times. In the 1800s two groups broke away. They believed that Judaism should adapt to new situations. Reform Jews made the most changes. They do not participate in all the ceremonies that are observed by Orthodox Jews. Conservative Jews uphold many ancient traditions but have made some changes in their religious practices.

History

Abraham

Judaism is thought to trace back to about 2000 BC. A man named Abraham is considered the founder. According to

the Torah, God told Abraham to leave his home in Mesopotamia (now Iraq) and take his people to Canaan (Palestine). God promised that if Abraham obeyed, he and his offspring would become a great nation in this new land. This is the first covenant, or agreement, that God made with the Jews.

Moses

Long after the days of Abraham, a famine caused the Israelites to move to Egypt. They were later turned into slaves there. After more than 400 years, the Jews were freed from slavery under the leadership of Moses in about the 1200s BC. As instructed by God, Moses led the Israelites back to Canaan. Jews believe that God gave Moses the Ten Commandments and promised that if the Israelites followed these rules, he would look after them.

Rise and Fall of Israel

Over the next several centuries, Israel became a fairly powerful nation in the Middle East, particularly under its first three kings—Saul, David, and Solomon. David conquered Jerusalem and established it as the capital city. His son, Solomon, built the first great Temple of Jerusalem in the 900s BC.

In the 700s BC the Assyrian Empire captured northern Israel. Early in the 500s BC, Babylonians conquered southern Israel, destroyed the Temple, and sent some of the Jews away into slavery. This event marked the beginning of the Diaspora, which means “scattering.” From then on, the Jewish people were no longer together in one place.

Some Jews later returned to their homeland and rebuilt the Temple. But the region remained under the control of one foreign power after another. The Roman Empire took control of the area in the 1st century BC. Jewish revolts against the Roman Empire in the 1st and 2nd centuries AD were unsuccessful. During this period the Romans destroyed the second Temple. Many Jewish people moved away and eventually settled in other countries.

Establishment of Modern Israel

In the late 1800s a movement called Zionism began in Europe. It was named for Mount Zion, a hill in Jerusalem. The Zionists wanted to create a new Jewish country in Palestine. In the early 1900s many Zionists moved to Palestine to escape harsh conditions in Europe. By 1935 the Jewish population in Palestine was about 300,000.

This Jewish immigration increased greatly when Adolf Hitler came to power in Germany in the early 1930s. Hitler and his Nazi Party hated the Jews. First the Nazis made life hard for Jews, and later they decided to kill them. This crime became known as the Holocaust. The Holocaust ended with the defeat of Germany in World War II in 1945. Three years later the modern country of Israel was founded as a homeland for the Jews.

Juneau

Population
(2000 census)
30,711; (2007
estimate)
30,690

Juneau is the capital of the U.S. state of Alaska. It has the largest area of any U.S. city. The city covers more than 3,000 square miles (8,000 square kilometers).

Juneau lies on the Gastineau Channel, a narrow passage of the Pacific Ocean. The city has no road connections with most of the rest of Alaska. It must be reached by air or water.

Many people in Juneau work for the government. Tourism, fishing, forestry, and mining are also important to the city's economy.

The Juneau area was once a fishing camp of the Tlingit Indians. In 1880 gold was discovered there. Gold miners

Juneau, Alaska, lies at the foot of Mount Roberts and Mount Juneau.

then founded Juneau. For many years the city was the mining center of Alaska. Juneau's gold mine closed in 1944.

Juneau became the capital of Alaska in 1900. In 1959 Alaska became a U.S. state. Juneau was then the state capital.

Juniper

Junipers are evergreen trees and shrubs with fragrant wood and flavorful berries. They belong to the cypress family. Some junipers are called cedars, but they are not true cedars. True cedars belong to the pine family.

Junipers are found throughout the northern parts of the world. They grow well in shallow, rocky soil. The roots are often aboveground, and they can curl around boulders and other objects.

Junipers can grow as a low, spreading shrub or as an upright tree. Some trees are as tall as 60 feet (18 meters). The

Juniper berries are used to flavor foods and drinks.

bark is brownish red or gray. The leaves are flat and look like needles. They can be bright green, golden, silvery, or bluish green. Juniper berries can be white, pale green, blue, purple, or black.

Junipers grow very slowly and can live a long time. Some junipers growing in the western United States are estimated to be more than 2,000 years old.

Juniper wood is used to make fence posts, pencils, and storage chests. The berries are used to flavor meats, sauces, and drinks. Oil from junipers is used in perfumes and soaps.

Jupiter

Jupiter is one of the planets that orbit, or travel around, the sun in the solar system. It is the largest planet in the solar system. In fact, it is bigger than all the other planets put together. Jupiter is the fifth planet from the sun. It travels around the sun at an average distance of about 484 million miles (780 million kilometers).

Physical Features

Jupiter is so huge that it could contain more than 1,000 Earths. Its diameter, or distance through its center, is about 89,000 miles (143,000 kilometers).

Jupiter is a kind of planet called a gas giant. It consists almost entirely of gases, mainly hydrogen and helium. The planet has no solid surface.

Jupiter's clouds appear in colored spots and bright and dark stripes. These markings show the planet's weather patterns. One of the spots is a huge storm called the Great Red Spot. The storm is more than twice as wide as Earth. It has lasted hundreds of years.

Deep inside Jupiter is an area of hot, thick liquid. The planet's center may reach temperatures of 45,000° F (25,000° C).

A system of thin rings surrounds Jupiter. The rings consist of tiny rocks and dust. They are much smaller and dimmer than the planet Saturn's rings.

Orbit and Spin

Like all planets, Jupiter has two types of motion: orbit and spin. Jupiter orbits, or travels around, the sun very slowly. It takes about 12 Earth years to complete one orbit. In other words, a year on Jupiter lasts about 12 Earth years.

Jupiter also spins rapidly about its center. The planet takes less than 10 hours to complete one rotation. That is how long a day lasts on Jupiter.

Moons

More than 60 moons orbit Jupiter. Most of them are very small. However, Jupiter has four very large moons: Io, Europa, Callisto, and Ganymede. Ganymede is larger than the planet Mercury.

Though Jupiter appears solid, it is made up mostly of gases.

Observation and Exploration

People have observed Jupiter from Earth since ancient times. Scientists sent the first unmanned spacecraft to the planet in the 1970s. The spacecraft, called Pioneer 10 and 11 and Voyager 1 and 2, flew by the planet and collected information about it.

Later the unmanned U.S. Galileo spacecraft orbited Jupiter. In 1995 it dropped an object called a probe toward the planet. The probe sailed through the upper layers of Jupiter's gases and measured their properties. It was the first man-made object to make contact with a gas giant.

Kabul

Population
(2006 estimate)
2,536,300

Kabul is the capital of Afghanistan, a country in central Asia. It is Afghanistan's largest city and center of economy. The city's economy, however, was hurt by many years of war.

Kabul has existed for at least 3,500 years. It became an important city long ago because of its location. Kabul lies on the main routes to passes through the country's mountains.

In the early 1500s Kabul was the capital of the Mughal Empire of northern India. In the 1770s Afghanistan became an independent country with Kabul as its capital.

In recent history Kabul has seen much fighting. In the late 1970s and 1980s the city was the site of fighting during a civil war. The Soviet Union also invaded Kabul during that period.

In the 1990s local groups fought each other for control of Kabul. A group called the Taliban took over much of Afghanistan, including Kabul. The Taliban were thought to have helped terrorists who attacked the United States in 2001. In response U.S. forces bombed

Kahlo, Frida

Frida Kahlo was one of the most famous Mexican artists of the 1900s. She was

Frida Kahlo

known especially for her disturbing style and her many unsmiling self-portraits.

The pain Kahlo expressed in her paintings came from her own life. She was born Magdalena Carmen Frida Kahlo y Calderón in Coyoacán, Mexico, on July 6, 1907. She suffered from the disease polio at 6 years old and walked with a limp the rest of her life. At 18 she was nearly killed in a bus crash. Her injuries were so severe that she spent many weeks in the hospital.

Did You Know?

Kahlo often included blood and skulls in her paintings.

Kahlo began painting self-portraits while in the hospital. Once she was well, she showed her paintings to the famous Mexican painter Diego Rivera. Rivera was enthusiastic. He encouraged her and promoted her work to others. Kahlo and Rivera married in 1929. They divorced in 1939 but remarried in 1941.

During her life Kahlo was more famous in the United States and Europe than in her homeland. Since her death, on July 13, 1954, she has become equally famous in Mexico.

Kalahari

The Kalahari is a desert in Southern Africa. It lies mostly in Botswana. It also covers parts of Namibia and South Africa.

The Kalahari is covered mostly by reddish sand. Hills of sand, called dunes,

are common in the west. Rainfall is rare, and it varies from place to place and from year to year.

Despite the dry climate, the Kalahari has grasses, shrubs, and even some forests. Animal life includes antelope, wildebeests, giraffes, elephants, and cheetahs.

Most of the people of the Kalahari raise cattle and goats. They also grow corn, sorghum, and pumpkins. They get water from underground by digging wells.

Springbok, a type of antelope, roam through the Kalahari Gemsbok National Park in South Africa.

Some people have always lived in villages. Others, notably the San people, used to live as nomads. They traveled through the desert hunting animals and gathering food. Some San still live as nomads, but today most work on cattle ranches.

Kanem-Bornu Empire

Kanem-Bornu was an empire in Africa. It controlled trade around Lake Chad from the 800s to the 1800s. Its territories included parts of what are now Chad, Cameroon, Nigeria, Niger, and Libya.

Kanem-Bornu handled trade between North Africa and lands to the south. The empire sold such products as salt, elephant tusks, ostrich feathers, and live

© 2006 Encyclopædia Britannica, Inc.

animals. The empire also traded slaves to people in North Africa in exchange for horses. The Kanem-Bornu people raised crops and livestock for their own use.

The Kanem-Bornu Empire was originally known as Kanem. It was probably founded around the mid-800s. Kanem's rulers were members of the Sef family.

Kanem got stronger in the 1100s and 1200s. Then it shrank until little of it was left except for a southern province called Bornu. In the early 1500s Bornu recaptured the rest of Kanem and became Kanem-Bornu. The empire reached its height during the reign of King Idris Alawma. He ruled from about 1571 to 1603.

In 1846 the Sef dynasty died out. Other people then took power for brief periods. By the late 1800s the French, British, and Germans were making their own empires in Africa. They soon divided Kanem-Bornu among themselves.

A female kangaroo carries her baby in a pouch.

Kangaroos generally have soft, woolly fur. It can be gray, brown, red, or blue-gray. Some species have stripes on the head, back, or upper limbs.

Kangaroos can be 6 feet (1.8 meters) tall and weigh 200 pounds (90 kilograms), though some are much smaller. They have long, powerful back legs that are good for jumping. Their long, thick tails help them balance while jumping. Kangaroos use their short front legs almost like human arms.

A female kangaroo usually has one young, called a joey, each year. Just after birth it crawls into a pouch on the mother's stomach. It feeds on its mother's milk as it grows. Gradually, it learns to hop out and look for food. When it is 7 to 10 months old, the joey leaves the pouch for good.

Marsupial

Did You Know?

Some people in Australia hunt kangaroos for their meat.

Kangaroo

Kangaroos belong to a group of animals called marsupials. These animals carry their young in a pouch. There are more than 50 species, or types, of kangaroo. Some of the smaller species are called wallabies.

Kangaroos live in Australia and nearby areas. Most live in grasslands, but one species lives in trees.

Kansas

Farmers in Kansas grow sunflowers as a crop. Sunflower seeds are used as food. They also contain oil that is used in cooking.

The U.S. state of Kansas is named for the Kansa (or Kaw) tribe of Native Americans who lived along the Kansas River. Because so many wild sunflowers grow in the state, Kansas is nicknamed the Sunflower State. Kansas has been the site of many tornadoes, leading to another nickname—the Cyclone State. The capital is Topeka.

Geography

Kansas sits at the geographical center of the 48 states that lie between the Canadian border and Mexico. Osborne County in Kansas is the center of North America. Kansas is bordered on the north by Nebraska, on the west by Colorado, on the south by Oklahoma, and on the east by Missouri.

All of Kansas is made up of generally level plains. The land rises slowly and steadily from 700 feet (210 meters) above sea level in the southeast to more

than 4,000 feet (1,200 meters) near the Colorado border in the west. The main rivers are the Kansas in the north and the Arkansas in the south. Kansas has warm summers and cold winters.

People

Whites of European heritage make up the majority of the Kansas population. Hispanic Americans represent about 7 percent of the population, African Americans about 6 percent, and Asians about 2 percent. Almost 25,000 Native Americans live in the state.

The largest city in Kansas is Wichita, located on the Arkansas River in the south-central part of the state. Kansas City sits where the Kansas and Missouri rivers meet. The main public institutions of higher education are the University of Kansas, at Lawrence, with its Medical Center at Kansas City; Kansas State

Economy

The state's leading manufacturing product is transportation equipment, including aircraft and motor vehicles. Kansas farm products have made the processing of foodstuffs another important manufacturing industry. The most valuable farm products are cattle, wheat, and corn. Telecommunications and service industries such as finance, commercial sales, the transportation of goods, and health care are also large parts of the state's economy.

History

The Cheyenne, Pawnee, Kaw, and other Native American groups lived in what is now Kansas before Europeans settled on the land. Spanish explorer Francisco Coronado visited the area in 1541. In 1682 the French explorer Sieur de La Salle claimed the region for his country. The United States acquired the region from France in the Louisiana Purchase of 1803. Kansas was thoroughly explored in the following decades.

The Kansas-Nebraska Act of 1854 created the Kansas Territory and opened it to white settlement. The law left it up to the settlers to decide whether they wanted Kansas to become a free (antislavery) state or a slave state. Slavery supporters established settlements at Atchison and Leavenworth. Antislavery groups founded Topeka and Lawrence. The two sides soon battled, and the fighting earned the territory the name Bleeding Kansas.

The Arkansas River flows through Wichita, Kansas.

Kansas joined the Union in 1861 as a free state. In the years after the American Civil War, Kansas became part of the frontier region called the Old West. Cowboys drove their cattle to such towns as Dodge City and Abilene. After the cattle boom ended in the 1880s, wheat farming became critical to the region. By 1900 most of the farmland had been taken over by settlers.

During the 1930s Kansas went through a severe drought. The state became part of what was known as the Dust Bowl as the drought ruined much of the farmland. As a result, many farmers and workers could not make a living. About 80,000 people left the state during this time.

In the 1940s, however, many people came to Kansas to work in the aircraft plants of Wichita. Since the 1940s Kansas has experienced a slow but steady growth in population.

Kansas-Nebraska Act

An illustration shows men lining up to vote on the issue of slavery in Kansas Territory. In 1855 voters chose to allow slavery.

A law called the Missouri Compromise of 1820 ruled out slavery in the United States north of Missouri's southern border. The Kansas-Nebraska Act of 1854 made it possible again. This angered abolitionists, or people who wanted to end slavery. It led to violence in Kansas, where people fought and killed each other over the issue of slavery. The fighting brought the United States closer to the American Civil War.

The Kansas-Nebraska Act created Kansas and Nebraska as territories. The act allowed the people of each territory to decide whether or not to allow slavery.

Nebraska stayed fairly calm, but Kansas did not. People who supported slavery

poured into Kansas from Missouri. They voted to allow slavery in 1855. Abolitionists came to Kansas from the Northern states. They did not think the vote in favor of slavery was legal. They held their own vote and set up another government.

The town of Lawrence was an abolitionist center. On May 21, 1856, a proslavery mob attacked the town. Three days later abolitionists led by John Brown struck back and killed five men. Over the next few years both sides made many violent attacks. The territory became known as Bleeding Kansas.

The people of Kansas voted against a proslavery constitution in 1858. By this time most of the people were against slavery. Kansas was admitted to the United States as a free state on January 29, 1861.

Kaw

The Kaw are Native Americans who once lived along the Kansas and Saline rivers in what is now Kansas. They are also known as the Kansa or the Konza. Both the state of Kansas and the Kansas River are named after the tribe.

The Kaw lived in villages of cone-shaped lodges that were large enough to house two or three families. They grew corn, beans, and other vegetables. After they were introduced to horses in the early 1700s, the Kaw began to hunt bison (buffalo) on horseback. They used bison skins to make clothing and to cover the tepees they used for shelter while on the hunt.

The Kaw believed that there were mysterious spirits called wakans that could help them in their lives. Kaw boys looked for these spirits while taking part in a ceremony called the vision quest.

The Kaw first lived in eastern North America, along the coast of the Atlantic

A group of Kaw meets with a representative of the U.S. government in the 1800s.

Ocean. They later moved westward along with other related tribes, including the Omaha, the Osage, the Quapaw, and the Ponca.

European explorers began to arrive in Kaw territory in the early 1600s. The settlers carried new diseases, such as smallpox, that killed many of the Kaw. The settlers also wanted the Kaw's land. By the mid-1800s the Kaw had signed agreements that gave most of their territory to the U.S. government. The Kaw moved to a reservation in what is now Kansas. In 1873 they moved to a reservation in Indian Territory (now Oklahoma). In the early 20th century, the reservation was divided into small, privately owned pieces of land.

By the end of the 20th century there were about 1,000 Kaw. Most lived in Oklahoma.

Kazakhstan

The largest nation in central Asia is Kazakhstan. It is named for the Kazakhs, a people who once roamed the region's vast grasslands. The capital is Astana.

Kazakhstan shares borders with Russia, China, Kyrgyzstan, Uzbekistan, and Turkmenistan. The Tian Shan mountain range lies along the border with China. Much of the south and center is desert.

Grasses and shrubs grow on the plains and in the desert. Antelope and elk live on the plains. Wolves, bears, snow leopards, and saiga (a hoofed animal) live in the hills.

The Kazakhs, a Muslim people, make up more than half of the population. About one third of the people are Russians. Other ethnic groups include Ukrainians, Uzbeks, Germans, and Tatars. The main languages are Kazakh and Russian.

Young women dressed in traditional clothing and fur hats attend a ceremony in Astana, Kazakhstan.

Kazakhstan's economy is based on its petroleum (oil) and natural gas. Kazakhstan also mines iron ore, copper, zinc, and gold. Its industries produce iron and steel, food products, and machinery. Farmers raise wheat, vegetables, cotton, and livestock.

Over the centuries the Mongols and others ruled parts of Kazakhstan. In the 1400s many Uzbeks arrived. They lived as nomads, or wanderers, and became known as Kazakhs. The Kazakhs soon ruled an empire in central Asia.

By 1848 Russia controlled the Kazakhs' land. In 1920 Kazakhstan became part of the Soviet Union. After the Soviet Union collapsed Kazakhstan declared its independence in 1991.

Keller, Helen

Helen Keller

Helen Keller was both blind and deaf. But despite these disabilities, she became a skilled writer and speaker.

Helen Adams Keller was born on June 27, 1880, in Tuscumbia, Alabama. When she was 19 months old, she got very sick. The disease left her unable to see or hear.

When Helen was 6, she got a teacher named Anne Sullivan. Sullivan used Helen's sense of touch to teach her. She handed Helen a doll. Then she traced the letters of the word doll on the palm of Helen's hand. Helen guessed the connection between the letters and the object she was holding. She learned that things had names.

With Sullivan's help, Helen made rapid progress. Soon she could read sentences by feeling raised words on cardboard. A few years later she learned Braille. Braille is a special system of writing for the

blind that uses raised dots instead of printed words. People read Braille with their fingertips.

Learning to speak was a bigger challenge. Helen did it by touching the lips and throat of a person who was speaking. She was able to feel the way the lips moved and the throat vibrated. At the same time someone spelled out the words that were being spoken.

Keller graduated from Radcliffe College in 1904. Then she wrote magazine articles and books about blindness.

Keller also gave many speeches. Some people had trouble understanding her, so she took along another person who repeated her words. Keller died in Westport, Connecticut, on June 1, 1968.

Blindness • Braille • Deafness

Helen Keller touches the face of Anne Sullivan, her remarkable teacher. Keller learned to speak partly by feeling how people's lips move when they talk.

Kennedy, John F.

John F. Kennedy was the 35th president of the United States.

John F. Kennedy was the 35th president of the United States. He was the youngest person ever elected to the presidency. Kennedy was a very popular leader. His assassination in 1963 shocked the country and the world.

Early Life

John Fitzgerald Kennedy was born on May 29, 1917, in Brookline, Massachusetts. He was the second of nine children born to Joseph and Rose Kennedy. Both his grandfathers had been in state politics. His father held government posts under President Franklin D. Roosevelt.

In 1940 Kennedy graduated from Harvard University. During World War II he joined the U.S. Navy. He commanded a torpedo boat in the Pacific Ocean. It was sunk by a Japanese destroyer. Although

he was seriously hurt, Kennedy led his crew to safety. For this he earned a medal for heroism.

Political Career

In 1946 Massachusetts voters elected Kennedy, a Democrat, to the U.S. House of Representatives. In 1952 Kennedy was elected to the U.S. Senate. During his two terms he fought for labor reform and civil rights. While he was a senator Kennedy married Jacqueline Lee Bouvier. They had two children. He also published the book *Profiles in Courage* (1956), about great U.S. leaders.

Presidency

Kennedy ran for president in the 1960 election. He defeated his Republican opponent, Richard M. Nixon. In his speech on the day he took office Kennedy asked citizens to help make the United States a better place. He said, “Ask not what your country can do for you—ask what you can do for your country.”

Kennedy took office during the Cold War, a time of tension between the United States and the Soviet Union, a Communist nation. He promised to stop the spread of Communism. He sent military advisers, money, and supplies to fight Communists in Vietnam. In 1961 he supported rebels who wanted to overthrow the Communist government of Cuba. The rebels’ invasion at the Bay of Pigs in Cuba failed, however.

A serious crisis of the Cold War took place in October 1962. The United

TIMELINE

Kennedy is born in Brookline, Massachusetts.

May 29, 1917

A U.S.-backed invasion of Cuba at the Bay of Pigs fails.

1961

Cuban missile crisis almost leads to nuclear war.

1962

Kennedy is assassinated in Dallas, Texas.

November 22, 1963

Kennedy is elected president.

1960

Congress approves the Peace Corps.

1961

Agreement to end most testing of nuclear weapons is signed.

1963

States discovered that the Soviet Union was building nuclear missile bases in Cuba, which is very close to the U.S. state of Florida. Kennedy saw this as a threat to the United States. He ordered U.S. warships to Cuba. For 13 days nuclear war seemed near. Finally the Soviets agreed to remove the weapons. The next year the United States, the Soviet Union, and Great Britain signed the Nuclear Test-Ban Treaty. It banned most nuclear testing.

Meanwhile, Kennedy proposed programs to help people both at home and in other countries. He sought to lower unemployment, provide medical care for the aged, reduce taxes, and protect civil rights. Kennedy also supported exploration of the moon. Congress approved several of his projects, including the Peace Corps, a volunteer service to help other countries in their development efforts. Other plans did not pass until after Kennedy's death.

Assassination

During his campaign for reelection, Kennedy visited Dallas, Texas, on November 22, 1963. He and his wife were riding through the city in an open car when shots rang out. Bullets hit the president in the neck and the head. He died shortly after he was brought to the hospital. Within hours Vice President Lyndon B. Johnson was sworn in as president.

Police arrested Lee Harvey Oswald for the shooting. Jack Ruby, a nightclub owner, killed Oswald before he could go on trial. Some people thought that a secret group had planned Kennedy's assassination. Johnson ordered an investigation. The Warren Commission was formed to examine the evidence. It decided that Oswald had acted alone.

Kentucky

In 1792 Kentucky became the first U.S. territory west of the Appalachian Mountains to gain statehood. The capital of Kentucky is Frankfort.

The state probably took its name from a Native American word meaning “meadowland” or “prairie.” Kentucky is nicknamed the Bluegrass State after the bluish green grass that grows in many parts of the state. It is known for its Thoroughbred horses and the Kentucky Derby, a very popular horse race held each year.

Geography

Kentucky is located in the south-central part of the United States. The Ohio River separates northern Kentucky from Ohio, Indiana, and Illinois. The Tug River and the Big Sandy River run between Kentucky and West Virginia on the east and northeast. Virginia borders Kentucky to the southeast, and Tennessee lies to the south. In the west the Mississippi River forms the boundary between Kentucky and Missouri.

Louisville is the largest metropolitan area in the U.S. state of Kentucky. It lies on the Ohio River.

In the east are the Appalachian Mountains, including the Cumberland and Pine ranges. Between the eastern mountains and the Tennessee River in the west is a large area of lowlands. The westernmost part of the state is an area of flat plains. It is part of the great lowland region that extends north from the Gulf of Mexico. Kentucky has cool winters and warm summers.

People

The majority of Kentucky’s population consists of whites of European descent. African Americans make up about 7 percent of the state’s population. Kentucky remains a largely rural state of small towns. The only cities with populations greater than 100,000 are Lexington and Louisville.

Economy

Manufacturing and service industries are the main sources of income and

employment in Kentucky. The major manufactured products include motor vehicles and parts, foodstuffs, fabricated metal products, and electronic equipment.

Tobacco has long been a major cash crop. The state ranks first in the nation in the breeding of racehorses. Broiler chickens and cattle are the most valuable farm animals. Kentucky is one of the major producers of coal in the nation.

History

The area that is now Kentucky was inhabited by the Shawnee, Iroquois, and Cherokee Indians when Europeans first arrived. For many years the American colonists could not expand westward into the region because they were blocked by mountain ranges. This situation changed in 1750 when the Cumberland Gap—a pass through the Cumberland Mountains—was discovered. In the 1770s the frontiersman Daniel Boone helped create a trail that allowed other pioneers to enter the territory.

The first permanent white settlement in what is now Kentucky was founded in 1774. The next year Boone founded a settlement at what is now Boonesboro. At first the region was made a part of the colony of Virginia. In the 1780s, however, Kentuckians began to call for the separation of their territory from Virginia. Success came in 1792, when Kentucky joined the Union as the 15th state.

During the American Civil War, Kentucky was one of the border states that lay between the North and South. Abraham Lincoln, president of the United States during the war, and Jefferson Davis, president of the Confederacy, were both born in the state. Although the state never withdrew from the Union, many Kentuckians fought for the Confederacy.

The economy of Kentucky grew steadily in the late 1800s. The introduction of tobacco farming brought much money into the state. Coal mining on a large scale began in the 1870s. Bloody clashes between miners and operators took place in the 1930s. In later decades mining machinery reduced the need for miners. Manufacturing businesses became increasingly important in the latter part of the century. In the early 21st century, manufacturing still represented a significant part of Kentucky's economy.

Kenya

Kenya, a country in East Africa, is a land of natural beauty. Many visitors come to Kenya to see its scenery and its rare wild animals. Kenya's capital is Nairobi.

Geography

Kenya lies along the equator on Africa's east coast. Kenya touches Tanzania, Uganda, Sudan, Ethiopia, and Somalia. Lake Victoria lies in the west. The Indian Ocean is to the east.

Highlands rise in the western part of Kenya. The Great Rift Valley divides the highlands. Mount Kenya, at 17,058 feet (5,199 meters), is Kenya's highest peak. It lies in the center of the country. East of the highlands, the land slopes down toward the coast.

Kenya's most important river, the Tana, flows from the highlands to the Indian Ocean. Most of the country's other rivers are short and shallow. They some-

Workers dry coffee on racks in Nyeri, Kenya.

times dry up when there is little rainfall. The Great Rift Valley has many lakes.

Kenya has two wet seasons and two dry seasons. The highlands and the coast receive the most rain. The north is Kenya's driest area. Temperatures are generally warmer in the north and cooler in the highlands.

Plants and Animals

Evergreen forests and bamboo grow in the highlands. East and west of the highlands, low trees grow among grass. Thorn bushes and baobab trees dot the dry landscape of the north. The coast is mainly grassland with some forests.

Some of the rarest wildlife in the world lives in Kenya. The country's animals include elephants, rhinoceroses, lions, leopards, giraffes, wildebeests, zebras, impalas, hyenas, hippos, and crocodiles. Many national parks and game reserves protect the wildlife.

Impalas graze in Nairobi National Park in Kenya.

People

The people of Kenya belong to many different ethnic groups. The largest groups are the Kikuyu, the Luhya, the Luo, the Kalenjin, and the Kamba. There are also groups of nomads, or wanderers, such as the Masai. Each group has its own language and culture. Most people also speak English or Swahili as a second language.

The most common religion is Christianity. Smaller groups of people follow Islam or traditional African religions.

Most Kenyans live in rural areas, but cities have grown rapidly since the early 1970s. Nairobi is the largest city.

Economy

Most Kenyans are farmers who grow crops for their families. Corn is the main food crop. Kenya also grows tea, flowers, and coffee to sell to other countries.

Manufacturers make flour from grains and sugar from sugarcane. They also

produce beverages, petroleum (oil) products, cloth, paper, cement, and leather.

Tourism is an important part of Kenya's economy. Many tourists visit Kenya to see its wildlife or to visit its beautiful beaches.

History

For centuries African people along Kenya's coast traded with Arabs from across the Indian Ocean. Europeans arrived in the area in the 1800s. By the 1890s the British had taken control of Kenya. They made it a British colony in 1920.

The British encouraged white people from Great Britain and South Africa to settle in Kenya. The British set aside much of the colony's land for whites. As a result, the native people of Kenya grew angry at the British. In 1952 they began a rebellion. A group called the Mau Mau led the struggle. The British stopped the Mau Mau rebellion in 1960. But the people of Kenya continued to push for freedom. Kenya became an independent country in 1963.

After independence, Kenya had a strong government. It banned political parties that disagreed with it. Other countries criticized the government's actions. In 1992 Kenya held its first elections since the 1960s with candidates from more than one political party. After that, Kenya's government improved.

Key, Francis Scott

Many citizens of the United States know the words to the most famous song written by Francis Scott Key, “The Star-Spangled Banner.” Key wrote the song during the War of 1812. It later became the U.S. national anthem.

Key was born in western Maryland on August 1, 1779. He studied at home until age 10. He then went to school in Annapolis. Later he studied law at St. John’s College. After graduating, Key set up a law practice in Georgetown, in what is now Washington, D.C.

In August 1814, during the War of 1812 between the United States and Great Britain, the British set fire to the Capitol and other buildings in Washington,

D.C. Afterward they captured a friend of Key’s named William Beanes. As a lawyer, Key went to ask the British to free Beanes. The British agreed but held both men on a ship overnight.

During the night Key watched the British attack Fort McHenry, which guarded Baltimore, Maryland. At dawn Key saw the U.S. flag still flying over the fort. It had not fallen to the British. Relieved, Key began to write a poem about the battle.

Key published the poem under the title “Defence of Fort M’Henry.” People soon began singing the poem to the tune of an English drinking song, “To Anacreon in Heaven.” The song, now called “The Star-Spangled Banner,” became popular across the country. The U.S. Army and Navy later used it as their anthem.

In 1833 Key became an attorney for the District of Columbia. He also kept writing. He published *The Power of Literature and Its Connection with Religion* in 1834. *Poems* appeared in 1857, long after Key’s death in Baltimore on January 11, 1843. In 1931 the U.S. Congress made “The Star-Spangled Banner” the national anthem.

Khartoum

Population
(1993 census),
city, 947,483;
(2008
estimate), urban
area,
8,000,000

Khartoum is the capital of Sudan, a country in northeastern Africa. The city lies where the Blue and White Nile rivers meet to form the main stream of the Nile River. Two other cities, Omdurman and North Khartoum, lie just across the rivers. Omdurman is the largest city in Sudan. It is also the place where the country's lawmakers meet.

Khartoum is Sudan's center of transportation and trade. Many people in the city work for the government.

A man walks past a mosque in Khartoum, Sudan.

Factories there make cotton cloth and other products.

Khartoum began in 1821 as an Egyptian army camp. It soon grew into a town. Egypt and Great Britain shared control of the area.

In the 1880s local Muslim forces rebelled against foreign rule. They captured Khartoum in 1885. British and Egyptian troops took back the city in 1898. Khartoum was the center of British and Egyptian rule of Sudan until 1956. In that year Sudan became an independent country with Khartoum as its capital.

Did You Know?

"Khartoum" means "elephant's trunk" in the Arabic language.

Khwarizmi, Al-

Al-Khwarizmi was an Arab mathematician and astronomer of the AD 800s. He is known as the Father of Algebra.

Muhammad ibn Musa al-Khwarizmi was born in about 780. Historians believe that either he or his ancestors came from Khwarezm, a region in central Asia. The region is now part of the countries called Turkmenistan and Uzbekistan.

As an adult al-Khwarizmi lived in Baghdad, in what is now Iraq. There he worked at the House of Wisdom, a center for scientific research. Al-Khwarizmi studied the works of Arab, Greek, and Indian scholars.

A postage stamp honors the mathematician known as Al-Khwarizmi.

Al-Khwarizmi invented new ways to solve mathematical problems. One of the books he wrote explained a problem-solving system that is now known as algebra. The word algebra comes from the Arabic word *al-jabr*, which appears in the title of al-Khwarizmi's book. European universities used the book to teach mathematics from the 1100s to the 1500s.

Another one of al-Khwarizmi's books introduced Arabic numerals to Europe. Arabic numerals are the 10 digits (0, 1, 2, 3, 4, 5, 6, 7, 8, 9) that most people use today.

Al-Khwarizmi was interested in more than mathematics. He also wrote important books on astronomy and geography. He died in about 850.

Numbers and Number Systems

Kidney

All living things must remove wastes from their bodies. Reptiles, birds, mammals, and some other animals remove some of these wastes through two body parts called kidneys. Kidneys are part of the urinary system. They take out extra water and wastes from the blood. These wastes leave the body in the form of urine.

Structure

Human kidneys are reddish brown and shaped like beans. They sit in the lower back, one on each side of the backbone. Each kidney is about 4 to 5 inches (10 to 12.5 centimeters) long.

The inner curve of the kidney has a dent in the middle called the hilus. The hilus is the point where blood vessels enter and leave the kidney. These blood vessels include a renal artery and a renal vein. The word renal means “kidney” in the Latin language. Blood enters the kidney

through the renal artery and leaves through the renal vein.

Also at the hilus is a funnel-shaped structure called the renal pelvis. The renal pelvis is a hollow area that collects urine. A tube called the ureter leads from the renal pelvis out of the kidney. The ureter runs down to the bladder.

Blood flows through the kidneys in tiny blood vessels called capillaries. The capillaries lead to tiny tubes called nephrons, which make urine. Each kidney has at least a million nephrons.

How Kidneys Work

Every few minutes all the blood in the body runs through the kidneys. The nephrons remove water and some substances from the blood. Some of these substances are waste. Others are nutrients, or things that are useful to the body. The nephrons pass the nutrients and most of the water back into the blood. The wastes and the extra water stay in the nephrons. This liquid is the urine. Drop by drop, the urine passes from the nephrons into the renal pelvis. From there it goes into the bladder, which stores the urine until it leaves the body.

Sometimes wastes, especially salts, remain in the kidneys. These salts can form hard lumps called kidney stones. Medicines can help to dissolve these stones.

Kilimanjaro, Mount

Located in northeastern Tanzania, Mount Kilimanjaro is the highest point in Africa. Though it lies in the tropics, its peak is covered with ice and snow year-round.

Mount Kilimanjaro is made up of three inactive volcanoes. Kibo is in the center, Mawensi is to the east, and Shira is to the west. Kibo is the highest peak, reaching a height of 19,340 feet (5,895 meters). Mawensi rises to 16,893 feet (5,149 meters). Shira is 13,000 feet (3,962 meters) high. Parts of the lower

slopes are densely forested. Elephants, buffalo, monkeys, and oxlike antelope called eland live in the forests.

People live only on the lower slopes. They grow bananas, millet, and coffee and raise cattle. On the southern and eastern slopes, the Chaga people have developed an irrigation system for watering their crops.

Europeans learned of Kilimanjaro when German missionaries spotted it in 1848. Climbers first reached Kibo's peak in 1889. Today thousands of hikers try to climb Kibo each year. The town of Moshi, at the southern foot of the mountain, is a base for climbers.

King, Martin Luther, Jr.

Martin Luther King, Jr., led the civil rights movement in the United States. He used nonviolent, or peaceful, protest to get equal rights for African Americans. He was awarded the Nobel peace prize in 1964.

Early Life

King was born in Atlanta, Georgia, on January 15, 1929. His father was a Baptist minister. At age 15 Martin entered Morehouse College in Atlanta. He graduated in 1948.

King studied for three years at a seminary (school for ministers) in Pennsylv-

Did You Know?

King learned nonviolent methods partly from the example of Mahatma Gandhi of India.

Mount Kilimanjaro extends nearly 50 miles (80 kilometers) from east to west.

Civil rights leader Martin Luther King, Jr., is pictured giving a speech after leading a march in Selma, Alabama.

nia. There he learned about nonviolent protest. King later received a degree from Boston University in Massachusetts in 1955. While in Boston he met Coretta Scott. They married in 1953 and had four children.

Civil Rights Movement

In 1954 King became pastor of a Baptist church in Montgomery, Alabama. In December 1955 an African American woman named Rosa Parks refused to give her seat on a Montgomery bus to a white man. She was arrested for breaking a segregation law. Such laws were meant to keep blacks and whites separate. To protest her arrest, King encouraged African Americans not to ride city buses. This was called the Montgomery bus boycott. The boycott was successful. In 1956 the U.S. Supreme Court banned racial segregation on public transportation.

In 1958 King organized a group called the Southern Christian Leadership Conference (SCLC). The SCLC led many nonviolent protests against segregation.

In August 1963 King and other leaders brought together about 250,000 people for a gathering called the March on Washington. Here King delivered his famous “I Have a Dream” speech.

King’s actions helped get the Civil Rights Act of 1964 passed. In 1965 King led a march in Selma, Alabama, in support of African American voting rights. Soon the Voting Rights Act of 1965 was passed.

Final Years

In 1966 King turned to other problems. He fought racism in Northern cities and spoke out against the Vietnam War. He planned a Poor People’s March to Washington, D.C.

In 1968 King went to Memphis, Tennessee, to help city workers who were on strike. On April 4 a white man shot and killed him. King was only 39 years old.

King’s reputation grew after his death. In 1986 the United States set aside the third Monday in January as a holiday to honor him.

Kingfisher

A kingfisher sits on a twig.

Kingfishers are brightly colored birds that often fish for their food. There are about 90 kinds of kingfisher throughout the world. Most of these live in warm regions near rivers or lakes.

Kingfishers have plump bodies that are about 4 to 18 inches (10 to 46 centimeters) long. Their feathers come in many colors. Many kingfishers have blue feathers on their back and reddish or white feathers on their belly. Some have a crest, or tuft of upright feathers, on top of their head. A kingfisher's short tail allows the bird to turn easily when it is underwater. The daggerlike bill is useful for spearing fish, insects, and other food.

Kingfishers hunt for fish by swooping down and diving into the water. Sometimes they hunt on land for lizards and insects. Kingfishers are also known for chasing and attacking each other in the air.

Kingfishers spend their time alone until it is time to mate. During the mating season, the birds pair up to build nests for their eggs. They make nests in the hollows of trees or dig tunnels in banks of earth. After the eggs hatch, the parents raise their young together. When the babies are old enough, the parents go off on their own again. Kingfishers can live as long as 15 years.

King Philip's War

In King Philip's War Native Americans tried to stop the settlers of New England from taking their land. They fought well but lost the war. After it ended, the English settlers felt free to take even more land.

Metacom, called King Philip by the English, was grand sachem (chief) of the Wampanoag people. The Wampanoag lived in what are now the U.S. states of

An illustration shows English settlers attacking Native Americans in 1675, during King Philip's War.

Did You Know?

About 12 white settlements were destroyed in King Philip's War.

Rhode Island and Massachusetts. Metacom and the neighboring English settlers did not trust each other. In 1671 the English demanded that the Wampanoag surrender their guns. Metacom then became convinced his people could no longer live side by side with the English. He persuaded the Nipmuc and other Native American tribes to help him fight the settlers.

In 1675 three Wampanoag men killed a Native American for helping settlers. Settlers then killed the three men. These events set off the war. It spread over much of New England. Settlers and Native Americans destroyed each other's villages.

In the spring of 1676 the Native Americans ran short of food. The winter had been harsh and the fighting had kept them from attending to their crops. Nevertheless, Metacom kept on fighting. He was killed in August 1676. Some fighting continued after that. However, it was clear that the settlers had won.

King Philip's War was the biggest war in New England during the 1600s. Native Americans attacked more than half of New England's 90 settlements. In addition, about 3,000 Native Americans and 600 English settlers died. After the war, the weakened Native Americans of southern New England were no longer able to stop the English from taking over their lands.

Kingston

Population
(2001 census),
city, 96,052;
(2006
estimate), urban
area, 585,300

Kingston is the capital of Jamaica, an island country in the Caribbean Sea. The city lies along a scenic natural harbor on the island's coast.

Kingston is Jamaica's main port and center of business. The city has a busy shipping industry. It is also a major tourist center. In addition, many people in Kingston work for the government.

Kingston was founded in 1692. In that year an earthquake destroyed the town of Port Royal. The people who survived the earthquake built Kingston nearby. The city grew quickly, mainly because of its harbor.

Devon House in Kingston was the home of one of the few black millionaires in Jamaica in the 1800s.

Great Britain ruled Jamaica for many years. The British made Kingston their capital on the island in 1872. The city survived several fires and, in 1907, a violent earthquake.

In 1962 Jamaica became an independent country. Kingston remained the capital.

Congo, Democratic Republic of the

Kiowa

The Kiowa are a Native American people who probably first lived in what is now Montana. In the 1700s they moved to the Great Plains. The Kiowa were powerful warriors. They defended their land from U.S. settlers and troops longer than most other Plains Indian tribes did.

After arriving on the plains the Kiowa were introduced to horses. On horseback Kiowa hunters followed roaming herds of bison (buffalo). Bison meat

Elk Tongue of the Kiowa poses with his daughter in about 1891.

became their major source of food. They used bison hides to make clothing and covers for their tepees. The Kiowa did not farm.

The Kiowa formed alliances with other Native American tribes. The Kiowa and their allies attacked travelers, traders, and settlers who entered their lands. They also raided settlements in Texas and Mexico. But U.S. settlers started taking over Kiowa land anyway. In 1867 some Kiowa leaders agreed to give up all their land except for a small reservation in what is now Oklahoma. Many Kiowa, however, continued to fight U.S. troops. They were defeated in 1875. Then most Kiowa moved to the reservation. At the end of the 20th century there were about 9,000 Kiowa.

Kiribati

The Republic of Kiribati consists of 33 islands in the central Pacific Ocean. It is part of the region called Oceania. Most of the islands are low atolls, or coral reefs surrounding a lagoon. The capital is Bairiki, on Tarawa Atoll.

Geography

Kiribati includes three island groups—the Gilbert Islands, the Phoenix Islands, and most of the Line Islands—and Banaba Island. The islands are spread over about 2 million square miles (5 million square kilometers). Kiritimati

(Christmas Island), in the Line Islands, is the world's largest coral atoll. It makes up nearly half of the country's land area. Kiribati has hot weather year-round.

Plants and Animals

Coconut palms are among the few plants that grow in Kiribati. Breadfruit trees and pandanus palms also grow on some of the islands. Kiribati's animals include seabirds and a variety of fish.

People

Almost all the people of Kiribati are Micronesians. Nearly everyone is Christian. Most people speak Gilbertese, but English is common on Tarawa Atoll. Most of the population lives in the Gilbert Islands. People usually live in huts.

Economy

Most people in Kiribati are farmers or fishers. The main crops are coconuts, taro, bananas, breadfruit, and papayas. Kiribati sells copra (dried coconut meat) and fish to other countries.

History

Great Britain took over the Gilbert Islands in 1892. Japan occupied Kiribati during World War II. The United States and Britain tested nuclear weapons on Kiritimati in the 1960s. Kiribati gained independence from Britain in 1979.

Kite

Kites are popular toys on windy days. A kite is made of paper, plastic, or cloth stretched across a light, often wooden frame. They fly high in the air at the ends of long strings.

Kites come in many sizes and shapes. Many simple kites are flat and shaped like diamonds. More complex kites might be shaped like boxes or even like animals.

Flying a Kite

Getting a kite into the air can take two people. One person holds the kite facing the wind. Another person stands some distance away and holds the kite's string. If the string is tight, the wind will push against the kite and raise it. The wind's force keeps the kite up.

Many children and adults fly kites for fun. Some form clubs that hold kite-flying events. In many Asian countries, kite flying is part of festivals.

Kites come in many different shapes.

History

People flew the first kites about 3,000 years ago, probably in China. These kites were strips of bamboo covered with silk.

Later, scientists used kites to study weather. In the American colonies in 1752 Benjamin Franklin flew a kite with a key attached in a thunderstorm. The key drew electricity from the storm, proving that lightning was a form of electricity. Such experiments are dangerous, however. Ordinarily kites should never be flown during bad weather.

Kites also teach aerodynamics—how solid objects move through the air. Inventors of early airplanes based many of their ideas on kites.

Military forces have used kites, too. During the early 1900s kites carried cameras and even soldiers to spy on enemies. During World War II (1939–45) soldiers practiced shooting down planes by shooting at kites.

Klamath and Modoc

The Klamath and the Modoc were two neighboring Native American peoples. They traditionally lived in what are now Oregon and California. They were separate tribes, but their languages and cultures were similar.

A photograph from the 1920s shows a Klamath woman preparing food.

Both tribes got much of their food by fishing. They also hunted small animals and gathered roots, berries, and seeds. During the winter Klamath and Modoc families kept warm in earth-covered homes. While on hunting and fishing trips in the summer, they camped in shelters made of poles and mats.

The Klamath and the Modoc had little if any contact with people other than Native Americans until the early 1800s. By the 1850s many settlers were invading Klamath and Modoc lands. In 1864, after years of fighting, the tribes agreed to give most of their territory to the U.S. government. Along with other Indian groups, they moved onto a reservation in southern Oregon.

A group of Modoc fled the reservation and were eventually sent to live in

Indian Territory (now Oklahoma). They became known as the Modoc Tribe of Oklahoma. In Oregon the Klamath, the Modoc, and the Yahooskin Band of the Snake Indians together become known as the Klamath Tribes. At the end of the 20th century there were about 500 Modoc and fewer than 3,000 Klamath.

Knee

The biggest joint in the human body is the knee. A joint is a place where bones meet. The knee lets the leg straighten and bend. It also supports the weight of the body above it.

The Human Knee

Two large bones, the femur and the tibia, meet at the knee. The femur is the

Humans, chickens, and all other animals that have a backbone and legs have knees.

thigh bone, and the tibia is the shin bone. Ligaments, or tough strands of tissue, connect the bones to each other. A layer of springy tissue called cartilage cushions the ends of the bones. A smaller bone called the patella, or knee-cap, sits at the end of the femur. The patella protects the front of the knee joint.

A large muscle group in the thigh comes together at the knee. It makes the leg straighten. When the leg is straight, the knee's ligaments tighten. This prevents the lower leg from rotating. Other muscles in the thigh make the leg bend.

Knees of Other Animals

All vertebrates, or animals with a backbone, that have legs also have knees. In many animals, including birds and horses, it looks as if the knees of the hind legs bend backward. These joints are actually ankle joints, not knees. The knees, which are higher on the leg, bend forward like human knees.

Knight

Today the king or queen of England makes people knights to honor good work. Male knights are called Sir. Female knights are called Dame. Hundreds of years ago knights were very different. They served an important role in society during the period called the Middle Ages (AD 500–1500). A knight then was a fighter of wars. He rode a

A picture from the 1300s shows knights on horseback returning from a tournament. Tournaments were contests in which knights showed off their skills and bravery.

horse and served a lord, or powerful landowner.

In the Middle Ages, a knight started training at about the age of 7. He was sent to live in the house of a lord. There he was a page. A page did odd jobs. He also learned different skills, including reading, writing, and hunting. At about age 12 he became a squire. A squire served a knight and learned how to use swords and spears. He also learned how to get around in body armor. At about age 21 the squire promised to serve a lord. Then the squire became a knight.

Knights were important during the Crusades. The Crusades were wars between Christians and Muslims. Knights, who were Christian, traveled to the Middle East to fight Muslims between 1095 and 1291. Several orders, or organized groups, of Christian knights formed

Did You Know?

The word knight comes from the Old English word *cniht*, which means "horseman."

during this time. Some of these orders became rich and powerful.

During the late Middle Ages there were changes in the way people fought wars. New weapons came into use that could be used from long distances. These included crossbows and cannons. They made knights less important. By the 1500s knighthood had become an honor that had almost no connection to fighting.

Knitting

Knitting is the making of textiles, or cloth, by interlocking, or connecting, loops of yarn. The yarn is usually wool or cotton, but almost any type of fiber can be knitted. Knitted cloth may be plain. Or it may contain many colors of yarn knitted together in attractive patterns.

Many people enjoy knitting sweaters, scarves, and other types of clothing as a hobby.

Knitting is different from weaving. Woven cloth does not have interlocking loops. Instead two sets of yarn cross each other in an over-under pattern. The interlocking loops make knitted cloth more stretchy than woven cloth. For this reason socks, tights, and other formfitting clothes are usually knitted, not woven.

Knitting by hand is a popular hobby. A knitter begins by looping yarn onto two or more needles. Knitting needles come in different lengths and widths. The knitter then uses the needles to stitch many loops of yarn together. Today most knitted cloth is made on large, fast, computer-controlled machines.

People have been knitting since ancient times. Early fishermen knitted fishnets. Knitted cloth from thousands of years ago has been found in Egyptian tombs. Throughout history home knitters have made sweaters, shawls, mittens, and socks for their families.

Koala

The koala is a small, furry animal of eastern Australia. It is sometimes called a “bear” because it looks like a living teddy bear. But the koala is not really a bear. It belongs to the group of animals called marsupials, which carry their young in a pouch. The scientific name of the koala is *Phascolarctos cinereus*.

The koala has a sturdy body with pale gray to yellowish fur. It is about 24 to 33

Did You Know?

A koala sits on a eucalyptus branch.

inches (60 to 85 centimeters) long. It has small, yellow eyes; a round, black, leathery nose; and big, fluffy ears.

The koala lives mostly in eucalyptus trees. It has strong claws and toes that help it to grasp branches. The koala eats the leaves of only a few types of eucalyptus tree. It can be hard for a koala to find food because it is such a picky eater.

A female koala has one baby at a time. The baby is called a joey. The mother carries the joey in her belly pouch for a few months. Then the joey climbs onto its mother's back. It clings to her until it is about 1 year old.

The koala was once hunted by the millions for its fur. Then governments passed laws to protect it. But the koala is

still threatened by disease and by the loss of its natural habitat.

Konigsburg, E.L.

The U.S. author E.L. Konigsburg has written several novels for young people. She has won two Newbery Medals, the top honor for children's fiction. Konigsburg's books deal with the important and everyday problems of children.

Konigsburg's original name was Elaine Lobl. She was born on February 10, 1930, in New York City. She grew up in Pennsylvania and earned a degree in chemistry. After graduation she married David Konigsburg.

E.L. Konigsburg began writing novels after her children were in school. Her first book, *Jennifer, Hecate, Macbeth, William McKinley, and Me, Elizabeth*, was published in 1967. The novel is about the character Elizabeth's loneliness at a new school, where she does not fit in. When she meets Jennifer, another outsider, the two girls become friends. The idea for the story came from the experiences of Konigsburg's daughter, who had to adjust to school in a new place.

Also in 1967, Konigsburg published *From the Mixed-Up Files of Mrs. Basil E. Frankweiler*. In the book, the heroine Claudia runs away from home with her brother, Jamie. They hide in the Metropolitan Museum of Art in New York

City. There they solve a mystery about an important statue. Konigsburg illustrated the book in addition to writing it. It won the Newbery Medal.

Konigsburg later published several other novels. She won her second Newbery Medal in 1997. That award was for *The View from Saturday*, a book of short stories.

Kootenai

The Kootenai (or Kutenai) are a tribe of Native Americans. They probably once lived on the Great Plains, in the middle of North America. Long ago, however, they moved west across the Rocky Mountains. There they settled in Idaho, Montana, and British Columbia, Canada.

The Kootenai got much of their food by fishing. They fished with spears and nets. They also built canoes from logs

and bark. The Kootenai also hunted. In the 1700s they got horses. They rode their horses east over the Rockies to hunt bison (buffalo) on the Great Plains. The Kootenai adopted some customs of the other Indians they met there. Like Plains Indians, the Kootenai wore clothing made from animal skins and lived in tepees while hunting.

In the early 1800s U.S. traders began arriving in Kootenai territory. The Kootenai were friendly to the newcomers. In 1846 the border of the United States and Canada was set. The border split Kootenai land between the two countries. Some Kootenai on the U.S. side moved north to Canada. Others settled on reservations in Idaho and Montana. The Canadian Kootenai settled in British Columbia.

At the end of the 20th century there were about 1,200 Kootenai. Half lived in the United States and half lived in Canada.

Koran

The Koran (or Qur'an) is the holy book of Islam. According to Muslim tradition, God revealed the Koran to the prophet Muhammad in visions and messages over a period of 20 years. In Islam, the book is regarded as the true word of Allah, or God. It is the final authority in Islamic social, religious, and legal matters.

Did You Know?

Each chapter of the Koran has a title taken from an important word in the chapter, such as "The Poets."

A Kootenai group poses in front of a tepee in the early 1900s.

The Koran was written in Arabic. It is divided into 114 chapters called suras, each of which includes a prayer and verses.

Message

During the time of Muhammad, Arabs worshipped many gods. The Koran emphasizes that there is only one God, Allah. Allah's message to Muhammad is both a warning and a promise. The warning is to all who refuse to believe in the one God. Those who believe in Allah and do Allah's will are promised a reward that will last forever.

Resurrection, or rising from the dead, is an important subject of the Koran. Other topics include angels and devils and heaven and hell. There are also chapters about marriage and divorce laws. Other sections tell the duties of

A woman reads the Koran.

parents to their children, of masters to their servants, and of the rich to the poor. The Koran also includes stories about prophets and people in the Bible.

History

Islam teaches that Muhammad received his first vision in AD 610. From time to time he received more messages from God, until he died in 632. Muhammad and his followers memorized the messages and sometimes wrote them down.

The year after Muhammad's death, many people who knew the Koran by heart were killed in a battle. Muslims feared that knowledge of the Koran would be lost, so they collected all the messages and wrote them down.

Korea, North

The Korean peninsula is a block of land that sticks out from East Asia. The nation of North Korea sits on the northern half of the peninsula. South Korea covers the southern half. The people of North Korea and South Korea share a long history and a common language. However, the two Koreas have been enemies since the late 1940s. North Korea's capital is Pyongyang.

Geography

North Korea shares borders with China, Russia, and South Korea. The East Sea, which is also called the Sea of Japan, forms North Korea's east coast. The Yellow Sea forms the country's west coast.

Mountains and valleys cover most of North Korea. The country's highest point, Mount Paektu, is in the north-east. North Korea's two longest rivers are the Yalu and the Tumen. They run along the border with China.

The winters in North Korea are long, cold, and snowy. The summers are warm and rainy. Tropical storms called typhoons sometimes strike during the rainy season.

Plants and Animals

Forests of fir, spruce, larch, and pine trees grow in the northern mountains. In the southern mountains there are

forests of oak, pine, elm, beech, and poplar trees.

Small numbers of deer, mountain antelope, goats, tigers, and leopards live in the forests. Many birds, including wild pigeons, herons, and cranes, live in the valleys. Rabbits and other small mammals are common. In the rivers there are many carp and eels.

People

Nearly all the people of North Korea are ethnic Koreans. A tiny number of Chinese also live in the country. All Koreans speak the Korean language. More than half of the people live in cities.

Most North Koreans follow no religion. Smaller groups of people follow traditional Korean beliefs or a religion called Chondogyo. Chondogyo combines Buddhism, Christianity, and Confucianism (ancient Chinese teachings).

© 2006 Encyclopædia Britannica, Inc.

Women wear traditional Korean clothing during a festival in Pyongyang, North Korea.

Economy

The North Korean government controls the economy. Most of the people work in factories or on farms. The factories produce iron and steel, chemicals, machinery, food products, cloth, and other goods.

North Korea's farms produce mainly rice. Other crops include potatoes, corn, cabbages, and soybeans. Fish and pigs are also important sources of food.

However, North Korea does not produce

enough food to feed its people. Hundreds of thousands of people died of starvation in the late 1990s.

History

People have lived on the Korean peninsula for more than 12,000 years. These early people settled along rivers and the seacoast. Sometime after 3000 BC the ancient kingdom of Choson rose up in the northwest. The Han Dynasty, or Han ruling family, of China conquered Choson in 108 BC.

The Three Kingdoms

By AD 400 three Korean states controlled the peninsula. Koguryo ruled the north, Paekche ruled the southwest, and Silla ruled the southeast. They are known as the Three Kingdoms.

The Three Kingdoms battled each other for centuries. With help from China, Silla defeated the Paekche and Koguryo kingdoms in the AD 600s. Silla then controlled most of Korea.

936

Japan takes over Korea.

1910

The Korean War begins.

1950

A lake lies near the top of Mount Paektu, which is the highest point in North Korea. Much of the country is mountainous.

During the peacetime that followed, Korea made advances in astronomy, medicine, metal casting, sculpture, and cloth making. Ships from Silla and China traded many products.

Koryo and Choson Periods

The Koryo state united Korea again in 936. The Koryo ruled from what is now the city of Kaesong, North Korea.

In 1392 a Korean general took power. He named his state Choson, after the ancient kingdom. The Choson capital was in the south, at what is now Seoul, South Korea.

Division into North and South Korea

In 1910 Japan made Korea into a Japanese colony. The Japanese brought modern ways, but they treated the Koreans very poorly. During World War II (1939–45) Japan forced Koreans to fight in the Japanese army. Japan lost control of Korea at the end of the war. In 1945, the Soviet Union took over the northern part of Korea. The United States sent its forces into the south.

North Korea became an independent country in 1948, one month after South Korea. Like the Soviet Union, North Korea adopted a Communist form of government.

The Korean War

In 1950 North Korea started the Korean War by invading South Korea. The United States and other countries helped South Korea. China, a Communist country, helped North Korea. The war ended in 1953 with the peninsula still divided.

North Korea After the War

North Korea's government ruled harshly. After President Kim Il-sung died in 1994, his son Kim Jong Il came to power.

In 2000 the leaders of the two Koreas met for the first time. They agreed to work toward a peaceful, reunited Korea. However, the relationship between the two countries remained tense.

Korea, South

For many centuries Korea was a single state on the Korean peninsula. The Korean peninsula is a piece of land that sticks out from East Asia. In the mid-1900s Korea divided into two countries: North Korea and South Korea. South Korea, also known as the Republic of Korea, covers the southern half of the peninsula. Seoul is South Korea's capital and largest city.

Geography

South Korea's only land border is with North Korea. South Korea's eastern border lies along the East Sea, or Sea of Japan. The Yellow Sea is to the west. The East China Sea is to the south. A large island named Cheju lies off South Korea's southwest coast.

Low mountains cover most of South Korea. The country's highest peak is Mount Halla on Cheju Island. South Korea's three largest rivers are the Nak-

People walk down a busy street in Seoul, South Korea.

tong, the Han, and the Kum. The lowlands near the rivers provide the country's best farmland.

South Korea has cold, dry winters. Its summers are hot and humid. The southern coast is the wettest part of the country.

Plants and Animals

Evergreen forests of camellia, camphor, and other trees grow on the southern coast and on Cheju Island. Pines, oaks, maples, and birches also grow in South Korea.

Deer and rabbits are among the most common animals. Many types of birds, reptiles, and fish also live in the country. South Korea's national parks protect some plants and animals.

People

Almost all the people of South Korea are ethnic Koreans. They speak the Korean

language. There is also a small group of Japanese people. Most South Koreans live in cities and towns. Many of the cities are very crowded.

Half of the population follows no religion. About one in four South Koreans is Christian. About the same number of people are Buddhists.

Economy

The South Korean economy depends on services and manufacturing. Services include banking, education, stores, the military, transportation, and entertainment.

Huge companies called *chaebol* control much of the country's industry. Factories in South Korea make cellular phones, televisions, and other electronic equipment. They also make cars, ships, machinery, cloth, and chemicals.

Statues at a museum in South Korea show men in traditional Korean clothes.

The first astronomical observatory in Asia was built in Kyongju, South Korea, in the 600s.

Agriculture is a smaller part of the economy. Rice is the most important crop. Other crops include cabbages, onions, and fruits. Farmers also raise large numbers of pigs, cattle, and chickens. Fish come from the sea or from fish farms.

History

By 10,000 BC people had settled on the Korean peninsula. The ancient kingdom of Choson was founded after 3000 BC. It was located in the northwest. In 108 BC Choson fell to the Chinese.

The Three Kingdoms

In the 1st century BC the Three Kingdoms were founded. They were Koguryo in the north, Paekche in the southwest, and Silla in the southeast. By AD 400 they controlled the peninsula.

The Three Kingdoms often fought each other. In the AD 600s Silla joined forces with China. It then conquered Paekche in 660 and Koguryo in 668. Most of Korea was then under Silla rule.

A period of peace followed. This time was marked by great achievements in such areas as medicine, sculpture, and cloth making. Silla and China were major trading partners.

Koryo and Choson Periods

In the 800s Silla lost control of parts of Korea. In 936 the Koryo state united the peninsula. Its capital was located in the north, at what is now Kaesong, North Korea.

Koryo was invaded several times in the 1200s. In 1392 it was overthrown by a Korean general. He founded the Choson Dynasty. Its capital was located in the south, at what is now Seoul, South Korea.

Division into North and South Korea

Korea became a Japanese colony in 1910. Japan tried to modernize Korea. However, it ruled harshly. Japan was defeated in World War II. Under a war-time agreement, the United States took over the southern part of Korea. The Soviet Union took over the north.

South Korea became a separate, independent country in 1948. Several weeks afterward, North Korea also became independent.

The Korean War

In 1950 North Korea invaded South Korea. The invasion started the Korean War. The United States and other countries sent armies to help South Korea. China supported North Korea.

About 1,800,000 Koreans were killed during the war. In 1953 the war ended, with the peninsula still divided into North Korea and South Korea. Ever since, armies have guarded both sides of the border.

South Korea After the War

South Korea changed its system of government several times. During the 1960s and 1970s, army leaders controlled the government. They did not allow anyone to challenge their power. They killed or arrested many people who disagreed with them.

In 1979 President Park Chung Hee was assassinated. In 1980 many people protested against the military government. Finally, in 1987, the constitution was changed to allow all the people to elect the president.

South Korea began to develop better relations with other countries. The 1988 Summer Olympic games took place in Seoul. North Korea and South Korea both joined the United Nations in 1991. The leaders of the two countries met for the first time in 2000. They agreed to work together.

Korean War

North Korea and South Korea fought the Korean War from June 1950 to July 1953. Other countries, notably the United States and China, also were involved. It was the first major battle over Communism. Communism is a political and economic system in which the government owns all property. Communism was first established in the Soviet Union. The United States and others were opposed to Communism.

Japan controlled Korea until the end of World War II (1939–45). After Japan lost the war, the Soviet Union took over in the north, while the United States took over in the south. The 38th parallel of latitude (38° north) was the dividing line between the two parts. In 1948 the country was officially divided into North Korea and South Korea.

On June 25, 1950, the North Koreans, supported by the Soviets, attacked southward across the 38th parallel. This began the Korean War.

The United States and 15 other countries sent troops to help South Korea. The North Korean army drove the South Koreans and early U.S. forces back to the southeast tip of the Korean Peninsula. Then fresh U.S. troops arrived. By October 1, 1950, the North Koreans had retreated to the north of the 38th parallel.

South Korea and its allies then advanced into North Korea. This angered China, a Communist country on North Korea's

The Korean War Veterans Memorial in Washington, D.C., honors Americans who served in the Korean War.

northern border. On November 25, 1950, Chinese troops entered the war. By December 15, they had driven the allies back south of the 38th parallel. By June 1951, after several more battles, the battle line stood mostly north of the 38th parallel.

Peace talks began in July 1951. On July 27, 1953, both sides signed an agreement. The boundary between North and South Korea was set very close to the battle line of June 1951. The Korean War took the lives of about 1,300,000 South Koreans, 1,000,000 Chinese, 500,000 North Koreans, and 37,000 Americans. Korea remained divided into the 21st century.

Kosovo

Kosovo is a self-declared country in the Balkans region of southeastern Europe. It was a province of Serbia until 2008, when the people of Kosovo declared their independence. Pristina is the capital of Kosovo.

Kosovo is bordered by Serbia to the north and east, Macedonia to the south, Albania to the west, and Montenegro to the northwest. Its land consists largely of two basins situated between mountains.

The land is good for growing crops. The people of Kosovo grow grains including wheat, barley, and corn. They also grow fruits and vegetables. They grow tobacco to be sold.

More than 90 percent of the people of Kosovo are Albanians. Most of the rest are Serbs. Islam is the main religion.

Kosovo once lay at the heart of the Serbian empire. Then the whole region was

conquered by the Ottoman Turkish army in 1389, and the two regions gained separate identities. Serbia won independence from Turkey early in the 1800s and regained control of Kosovo in 1912. In 1918 Serbia became part of a kingdom that was later renamed Yugoslavia. Kosovo remained a part of Serbia even after the rest of Yugoslavia broke apart in the early 1990s.

At about that time, Kosovo's Albanians began a movement to gain independence. A group called the Kosovo Liberation Army (KLA) began an armed rebellion in 1996. In response, the Serbian government attacked the Albanians. By 1998 widespread fighting had broken out between the KLA and Serbian troops. In March 1999 the North Atlantic Treaty Organization (NATO) launched a bombing campaign against the Serbians to try to stop the attacks on the Albanians. The fighting ended in June 1999.

The United Nations then took charge of running the province. By early 2008 Kosovo was determined to break away from Serbia. The province formally declared independence in February. The United States and several members of the European Union (EU) recognized Kosovo's independence. Serbia, Russia, and a number of other countries did not.

Kremlin

Several cities in Russia were built around fortresses called kremlins. Russians built kremlins for defense during the Middle Ages. A kremlin was often located along a river. A wall, a moat, and towers usually separated it from the surrounding parts of the city. Kremlins contained cathedrals (churches) and palaces for princes and bishops. They also held government offices and ammunition.

The most famous kremlin is located in central Moscow. It is often called just the Kremlin. The Kremlin is shaped like a triangle. Its east side faces the famous plaza called Red Square. Another side faces the Moscow River. The Kremlin has long been a symbol of Russia's power.

A Russian prince started building the Kremlin in 1156. It was first built of wood. In the 1300s it was rebuilt using white stone. Its red brick walls and great palaces, cathedrals, and towers were added later. Several of the palaces are now museums.

Behind the red brick walls of the Kremlin are many churches, palaces, and government buildings.

The Kremlin lost its importance as a fort in the 1620s. But it was the center of Russian government until 1712, when the capital was moved from Moscow to Saint Petersburg. Moscow once again became the capital in 1918 following the Russian Revolution. The Kremlin became the base of government when Russia became part of the Soviet Union in 1922. After the Soviet Union collapsed in 1991, the Kremlin remained the center of Russia's government.

Krill

Krill are shrimplike animals that live in the ocean. They belong to the group of animals called crustaceans, which also includes shrimp, crabs, and lobsters.

There are about 85 species, or types, of krill. They are an important source of food for fish, squid, whales, seabirds, and other animals, especially around Antarctica.

Krill can grow to about 2.5 inches (6 centimeters) in length. Like other crustaceans, krill have a hard covering known as an exoskeleton. A krill sheds this outside covering many times as it grows. The body is almost see-through, with small, reddish spots. Krill have many legs, which they use for swimming and gathering food. Most krill have special organs, or body parts, on their

underside that give off light. This makes them visible at night.

Krill swim together in large groups called swarms. Some swarms are so thick that they make the water look pink. Krill spend much of their time deep in the ocean away from enemies. At night they go to the water's surface to feed on plants or tiny animals. Krill are able to go without eating for months at a time.

Fishers catch krill to use as food for people and land animals. They are a rich source of vitamin A.

Kuala Lumpur

Population
(2000 estimate)
1,297,526

Kuala Lumpur is the capital of Malaysia, a country of Southeast Asia. It is the largest city in Malaysia. It is also the country's center of business and culture. In 1999 Malaysia's government began building a city called Putrajaya to be the new capital.

The economy of Kuala Lumpur depends on manufacturing and services such as banking, health care, and tourism. Fac-

The Petronas Twin Towers in Kuala Lumpur, Malaysia, were the world's tallest buildings when they were built in the late 1990s.

tories in the city make computer parts, electronics, furniture, foods, and other products.

Kuala Lumpur was founded by Chinese tin miners in 1857. The British soon took over the area. In the late 1880s Kuala Lumpur became the capital of a region called the Federated Malay States.

In 1957 the western part of Malaysia became independent. Kuala Lumpur was its capital. The rest of Malaysia became independent in 1963. Then Kuala Lumpur became the capital of all of Malaysia. The city grew very quickly.

Ku Klux Klan

The Ku Klux Klan, or KKK, is a terrorist group in the United States. Terrorist groups seek to achieve their goals by creating fear through violence. The Klan

formed after the Civil War ended in 1865. Its purpose was to frighten newly freed African Americans and to take away their rights. By the 1990s the Klan had broken up into small groups, mostly in the Southern states.

The early Klan was called the Invisible Empire of the South. Its leaders had such titles as Grand Wizard, Grand Dragon, and Grand Titan. Klan members wore white robes and hoods to hide their faces and to frighten people. They went out at night to scare, whip, and kill former slaves. Sometimes they burned homes and barns. After their raids Klan members often left behind a burning cross as a symbol of the Klan.

The Klan's membership went up and down over the years. It reached a peak of about 4 million members in the 1920s. At that time the Klan's list of enemies grew to include Catholics, Jews, immigrants (people from other countries), and others.

The Klan grew again in the 1960s. It was the time of the civil rights movement, which worked to gain equal rights for African Americans. Klan members protested this movement by attacking African Americans in the South.

Since then the number of Klan members has fallen to a few thousand people. The Federal Bureau of Investigation (FBI) and other police groups have watched the Klan and worked to prevent its members from hurting people. Courts have sent some Klan members to jail for

crimes that they committed many years earlier.

Kurd

The Kurds are an ethnic group that lives mostly in a mountainous region called Kurdistan. Kurdistan lies in southwestern Asia where the countries of Turkey, Iran, Syria, and Iraq meet. Kurds also live in other nearby countries. They speak a language called Kurdish.

Kurds have lived in the same territory since prehistoric times. Early Kurds moved from place to place while herding sheep and goats. Some Kurds still bring their animals to mountain pastures in the summer and return to their villages in winter. Many Kurds, however, are farmers who stay in one place. Some Kurds have moved to cities.

In the 600s most Kurds became followers of the religion known as Islam. People who practice Islam are called

Many Kurds now live in cities, but some still lead traditional lives of animal herding.

Muslims. There are two types of Muslims: Sunnites and Shi'ites. Most Kurds are Sunnites. They have had problems in regions governed by Shi'ites.

Many Kurds want to have their own country. The governments of those countries in which they live—especially Turkey and Iran—have sometimes tried to force the Kurds to give up their language and culture. The government of Iraq drove millions of Kurds out of their homes in the 1980s and 1990s. Kurds have often rebelled against the governments of Turkey, Iran, and Iraq. They hoped to win political and cultural freedom.

trade with other peoples. The Kushites could ship goods on the Nile River. They could also transport goods on roads to the Red Sea.

Kush

The ancient kingdom of Kush (also spelled Cush) ruled a region in Africa south of Egypt. The region was then called Nubia. Now it is a part of the country of Sudan. Kush began as an Egyptian colony. It rose to rule over Egypt and much of the Nile River valley. Kush combined Egyptian and other African cultures.

The people of Kush, called Kushites, were black Africans. Most Kushites were farmers, but there were also craftsmen and traders. The Kushites sometimes captured other people.

Kush was a rich kingdom. It had gold mines. It also had rich farmland. In addition, Kush was in a good location to

Nubia was originally part of ancient Egypt. During the 1400s BC Egypt divided Nubia into two parts. Kush was the southern part. During the 700s BC the Kushites took control of Egypt. In the 600s BC, however, the Assyrians from Asia drove them back to Nubia.

After that, Kush was a smaller kingdom on the middle Nile for almost 1,000 years. The kingdom of Aksum finally wiped out Kush in about AD 350.

The Kushites sold gold, incense, ivory, ebony, oils, ostrich feathers, and leopard skins to other peoples.

Kuwait

Despite its small size, the Middle Eastern country of Kuwait has some of the largest oil reserves in the world. The capital is Kuwait city.

Kuwait borders Iraq and Saudi Arabia. The Persian Gulf is to the east. Kuwait is a hot, flat desert with no lakes or rivers.

Kuwait's plants are mainly scrub and low bushes. Saltwater plants grow along the coast. The animals of the desert include foxes, small mammals called civets, gazelles, lizards, and snakes.

Most of Kuwait's people are Arabs. Many of them were born in neighboring Arab countries or in South Asia and came to Kuwait to work. Arabic is the main language, but English is common. Most Kuwaitis follow Islam. Almost all the people live in or near Kuwait city.

The economy of Kuwait depends on the sale of its oil. Kuwait also produces

Water towers dot the sky in Kuwait's capital.

natural gas, food products, clothing, and metal products. Agriculture is limited to growing small vegetable crops.

Nomads, or wandering peoples, lived in what is now Kuwait for many centuries. In 1756 a member of the Sabah family became sheik, or ruler, of Kuwait. The Sabah family ruled the country into the 21st century. In 1899, however, Great Britain took over Kuwait's foreign affairs.

In 1961 Kuwait gained independence. In 1990 Iraq invaded Kuwait. The invasion led to the Persian Gulf War. United Nations forces, led by the United States, drove Iraqi troops out of Kuwait in 1991.

The city of Kuwait is the capital of a country that is also named Kuwait. The city lies on a bay of the Persian Gulf, in the Middle East. Its name comes from the Arabic work *kut*, meaning “fort.”

Many government, business, and banking offices are located in Kuwait city. Kuwait University is also there. The city and its suburbs have large oil and chemical industries.

A group of Arab families founded Kuwait city in the early 1700s. For more than 200 years the city’s people made a living mostly by fishing and gathering pearls.

Modern skyscrapers rise above the city of Kuwait, Kuwait.

The country started producing oil in the middle of the 1900s. As a result Kuwait city grew much bigger and wealthier.

In 1990 troops from neighboring Iraq captured Kuwait city. The Iraqis took everything of value there, including food supplies. Many people fled. The invasion of Kuwait led to the Persian Gulf War of 1991. Iraq lost the war. Kuwait’s people then moved back and repaired the damage to the city.

Kwakiutl

The Kwakiutl are the people of several related Native American groups. They traditionally lived on or near Vancouver Island in what is now British Columbia, Canada.

The Kwakiutl built their villages along the water. They lived in large rectangular houses made from cedar wood. They made dugout canoes from the trunks of cedar trees. The Kwakiutl got most of their food by fishing and hunting deer and moose.

The Kwakiutl were famous for their ceremonial feasts known as potlatches. The family hosting a potlatch gave fine gifts to their guests. Potlatches were held to celebrate important occasions, such as a marriage or the birth of a child, or to make up for some offense against the tribe.

Chief Hamasaka of the Kwakiutl holds a ceremonial staff and rattle.

In the late 1700s British, American, and Russian traders began to arrive in the Kwakiutl's land. They brought goods such as steel tools. They traded these to the Kwakiutl in exchange for furs. In the mid-1800s settlers and missionaries began to arrive. They brought diseases that killed many Kwakiutl.

Both the missionaries and Canadian officials wanted the Kwakiutl to give up their old ways. Potlatches were outlawed by the Canadian government between 1889 and 1951. In the early 21st century there were more than 4,000 Kwakiutl living in Canada.

Kwanzaa

Kwanzaa is a celebration of African family, community, and culture. This Afri-

can American holiday was created in 1966 by a professor named Maulana Karenga. It is based on African harvest festivals. Its name comes from the African language Swahili and means “first fruits.” Kwanzaa takes place each year from December 26 to January 1.

The symbols of the festival come from different African cultures. The symbols include a candleholder, seven candles, ears of corn, gifts, and a unity cup. The celebrants use the unity cup to salute their ancestors and to show unity in the family and community.

Each day of Kwanzaa is dedicated to one of seven principles, or ideas. The principles are unity, self-determination, collective responsibility, cooperative economics, purpose, creativity, and faith. Each night, one or more of the seven candles is lit. Then, one of the seven principles is discussed. Kwanzaa is also celebrated with a community feast on December 31.

A family dressed in traditional African clothing lights candles for Kwanzaa. Other symbols of Kwanzaa, including an ear of corn and the unity cup, are on the table.

Kyrgyzstan

The Kyrgyz Republic, also known as Kyrgyzstan, is an independent nation in Central Asia. Until 1991 it was part of the Soviet Union. The capital is Bishkek.

Geography

Kyrgyzstan borders Kazakhstan, China, Tajikistan, and Uzbekistan. The massive Tian Shan mountain system runs throughout Kyrgyzstan. Its highest point is Victory Peak, at 24,406 feet (7,439 meters) tall. In general, Kyrgyzstan's summers are hot and its winters are cold. The lowest and highest areas are deserts.

Plants and Animals

Evergreen forests grow in the lower valleys and on some mountain slopes. White spruce, larch, juniper, and walnut trees are common. In the forests live brown bears, wild pigs, lynx, gray wolves, and ermines. Mountain sheep and goats, deer, and snow leopards live in the valleys. Hares, yellow gophers,

and large-eared hedgehogs live in the deserts.

People

Most of the people are Kyrgyz. The largest minority groups are Uzbeks and Russians. Most people speak Kyrgyz, a Turkic language, or Russian. About three fourths of the people are Muslims. More than half of the population lives in rural areas.

Economy

About half of Kyrgyzstan's workforce works in agriculture. They raise sheep, cattle, and horses. Crops include wheat, potatoes, sugar beets, cotton, and tobacco. Mines provide gold, coal, antimony, and mercury. Industries produce machinery and cloth. Kyrgyzstan also uses waterpower to produce electricity.

History

The ancient Kyrgyz were nomads, or wanderers. Beginning in the 1200s the Mongols, China, and neighboring Muslims ruled the Kyrgyz region at different times. In the late 1800s Russia gradually took control. The Kyrgyz lands became part of the Soviet Union in 1924. Kyrgyzstan declared its independence in 1991. Protesters forced out Kyrgyzstan's first president in 2005.

Labor

Most people have to work to get food, clothing, housing, and other things. Their work is called labor. Even people who do not work depend on the labor of others.

Types of Labor

In the simplest societies people work in small groups of family members or tribal members. Not everyone does the same work, however. For example, in some societies men hunt animals and fight enemies while women gather plants and care for children. This is called a division of labor.

In the past, many societies divided labor between free workers and slaves. Slaves got the worst jobs and could not leave them. They did not receive pay. Their owners punished them if they did not obey orders. People throughout history and in many different societies have owned slaves. Between the 1500s and the 1800s, Europeans made many Africans into slaves and took them to work in the Americas.

Like slaves, workers called serfs had to work for no pay. There were many serfs in Europe during the Middle Ages (from about AD 500 to about 1500). Serfs did farm work on land owned by more powerful people, called lords. Unlike slaves, serfs could not be sold. However, they were not free to leave the land.

In the towns of Europe in the Middle Ages, some products required special skills to make. The people who made

An illustration shows serfs working the land during the Middle Ages.

and sold them were called craftsmen. A group called a guild controlled each craft. There were guilds for weavers, blacksmiths, bakers, painters, and many other types of craftsmen. A young person learned a craft as an unpaid helper called an apprentice. Adult workers, called journeymen, got pay. A business owner was called a master.

A great change in the way people worked began in the 1700s, during the Industrial Revolution. Inventors created machines that made it easy to produce many goods quickly in factories. Many people went from working on farms and in craft workshops to working in factories. Factory workers did not need special skills, so the guilds disappeared. Factory workers usually worked long hours in unhealthy working conditions.

Did You Know?

Before 1833, children as young as 4 years old were put to work in Great Britain's cloth industry.

In the past most people worked on farms or in their homes. Today factories and other businesses employ many people.

Their pay was very low. Many children worked in factories, too.

Labor Movements

Workers soon began movements to demand better treatment from their employers. Many workers formed groups called labor unions, or trade unions. Unions often call for workers to strike, or stop working, until employers meet their needs.

United States

In the United States, skilled craft workers formed the first labor unions. Several nationwide labor groups started after the American Civil War. For example, trade unions founded the American Federation of Labor (AFL) in the 1880s.

In the 1930s the U.S. government finally gave workers real help. The National Labor Relations Act of 1935

gave workers the right to join a union. Other laws stopped child labor, helped unemployed workers, made wages higher, and shortened working hours.

In 1936 several unions formed the Congress of Industrial Organizations (CIO). The CIO supported workers in big industries like steel, automobiles, and rubber. By the end of the 1930s, unions represented almost 30 percent of U.S. workers.

The AFL and the CIO joined together in 1955. The new organization, called the AFL-CIO, was a leading force in U.S. politics. The AFL-CIO worked for job safety, equal rights for women and minorities, and bigger pensions (payments to retired people).

In the last part of the 20th century, union membership decreased in the United States. This was partly because companies were moving factory jobs outside the United States. Early in the 21st century, only 8 percent of workers for private companies belonged to unions. However, more than 35 percent of government workers were in unions.

Europe

European workers also had a long struggle for better pay and better working conditions. In Europe, however, labor unions usually combined with political parties, or groups, that supported socialism. Socialism is a political system in which the government owns certain kinds of businesses. The goal of socialism is to spread wealth more evenly. In many

Did You Know?

The first nationwide union in the United States was for printers. It was created in 1852.

countries, socialist parties got governments to provide generous benefits to workers. Union membership was higher in Europe than in the United States.

After World War II (1939–45), many countries in eastern Europe had Communist governments. Communism is a political system in which the workers share all property, based on their abilities and needs. Labor unions actually had little power in Communist countries. The governments controlled the unions completely.

However, in the early 1980s workers in Poland formed a union that became very powerful. The union was named *Solidarność* (Solidarity). At first the government banned the union. But the workers continued to hold protests and strikes. They asked for a role in the government in addition to better working conditions. Eventually the government allowed *Solidarność* members to participate in elections. This led to the end of Communist rule in Poland.

Demonstrators marching in Poland carry banners with the name of the Solidarity trade union.

Other Regions

In Asia and Africa, workers often started labor movements during the time their countries were fighting for independence from European powers. In South America, labor unions sometimes joined with governments to protect workers.

Several countries formed the International Labour Organization (ILO) in 1919. It is now an agency of the United Nations. The ILO protects the rights of workers and unions. It also helps countries to create fair labor laws.

Labor Day

Labor Day is a holiday that honors all workers. It also signifies the end of summer. The holiday is celebrated on the first Monday in September in the United States and Canada. Workers of all kinds enjoy the day off. It is a time for them to celebrate all that their work has made possible. The holiday is sometimes observed with parades and speeches, as well as political rallies. Other countries honor workers on May Day, which is celebrated on May 1.

Labor Day was first celebrated in the United States in New York City on September 5, 1882. At that first Labor Day, workers paraded in order to show their unity and desire for fair working conditions. The peaceful demonstration involved all types of workers, from

Many towns hold parades to celebrate Labor Day.

seamstresses to bricklayers. They waved banners bearing such slogans as, “Labor built this republic and labor shall rule it.” In June 1894 President Grover Cleveland signed a bill into law making Labor Day a national holiday.

Canadian workers first held parades in Ontario in 1872. In 1894 Canada made Labor Day a national holiday.

Lace

Lace is a beautiful and delicate textile, or fabric. It is used to make clothing and to decorate household objects, such as curtains and pillows.

There are many different styles of lace. Each has a different pattern of flowers,

leaves, or other designs. Today lace is usually made by a machine. However, lace makers make the most artistic kinds of lace by hand, using either needles or bobbins (spools).

Needle lace requires a needle and a single thread. The lace maker stitches the lace on top of a pattern attached to a piece of cloth. When the lace is finished, the lace maker cuts the stitches holding it to the cloth.

Bobbin lace requires a number of threads wound around different bobbins. The lace maker sticks a pattern of pins into a cushion. The lace maker then twists and crosses the threads around the pins to form the lace.

Before 1800, lace making was a popular art in Europe, especially in Italy, France, and Flanders (now part of Belgium). This handmade lace took a long time to make, and only skillful people could do it. For these reasons, lace was very expensive. In the 1800s people began

The most delicate and artistic kinds of lace are made by hand.

Lacrosse

The game called lacrosse is the oldest team sport in North America. Native Americans played it before the arrival of Europeans. The French who arrived in the 1600s noticed that the stick used to play the game looked like a crosier. A

A lacrosse player uses his crosse to carry the ball past a player from the other team.

crosier is a staff, or rod, carried by church leaders called bishops during religious ceremonies. The name lacrosse came from the word crosier.

Playing Field and Equipment

Lacrosse is played between two teams on a long, rectangular field. There are goals at each end. The goals are made of nets fastened over a tall frame. There are 10 players on men's teams and 12 players on women's teams.

The main equipment is a rubber ball and long sticks called crosses. Crosses have a net pocket at one end to catch the ball. Each player carries a crosse during the game.

Players wear a helmet with wire face mask, shoulder pads and hip pads, and protective gloves. They also wear shoes with cleats, or tiny spikes, which dig into the ground and prevent slipping.

Rules

The object of the game is to score points by making goals. The players on one team try to score goals by throwing the ball into the goal of the opposing team. Players may use the crosse to pass the ball to other players, or they may carry the ball in the crosse. They may also knock the ball out of opponents' crosses or try to block their way. Each team has a player called the goalkeeper, who defends the goal. Goalkeepers may use their hands to smack the ball away. The other players may not touch the ball with their hands.

History

The Iroquois people played the first games of lacrosse. Teams sometimes included as many as 1,000 men, and the goals might be placed several miles apart. The games could also last many days, from sunrise to sunset.

Lafayette, Marquis de

A painting shows the Marquis de Lafayette on a horse. Lafayette was a hero in the American and French revolutions.

The Marquis de Lafayette was a French soldier and nobleman who loved freedom. He became a hero for the United States during the American Revolution. He also helped to lead the French Revolution.

Early Life

Lafayette was born on September 6, 1757, in Chavaniac, France. His original name was Marie-Joseph-Paul-Yves-Roch-Gilbert du Motier. He inherited great wealth from his mother and a castle and the title of marquis from his father.

American Revolutionary

Young Lafayette decided to help the American colonies fight the British in the American Revolution. He arrived in the colonies in 1777. The colonists made him a major general.

Lafayette fought bravely and skillfully. He also got the king of France to send 6,000 soldiers to help the colonists. In 1781 Lafayette helped defeat the British commander, Lord Cornwallis, at Yorktown, Virginia. This event ended the fighting.

French Revolutionary

Lafayette then returned to France. In 1789 he helped write the Declaration of the Rights of Man and of the Citizen. This document expressed the ideas behind the French Revolution. During the revolution, Lafayette led the new national guard of Paris.

Some of the revolutionaries had extreme ideas. They wanted to kill the king and take property away from the landowners. Lafayette did not share those views. When the extreme rebels took power in 1792, Lafayette had to leave the country. After Napoleon Bonaparte came to

Did You Know?

Lafayette is an honorary citizen of the United States. Only a few other people have received this honor.

power in 1799, Lafayette returned to France and settled down as a farmer.

Later Life

The monarchy was later restored in France. In 1830 Lafayette took part in his third revolution. He helped to overthrow King Charles X. Lafayette died in Paris on May 20, 1834.

Lake

A lake is a large body of water that is surrounded by land. Lakes contain less than 1 percent of the world's freshwater, but they are a very important freshwater source. Almost all of the world's freshwater is either frozen in huge masses of ice or buried underground. Lakes contain more than 98 percent of the freshwater that is available for use.

How Lakes Form

Ice sheets called glaciers formed many lakes, especially in North America,

Europe, and Asia. Thousands of years ago glaciers covered large parts of these continents. The glaciers moved slowly over the land. They dug basins, or holes, in places where the rocks at the surface were weak. The basins that filled up with water became lakes. Other lake basins formed in places where melting glaciers left dirt behind. The dirt built up to form basin walls.

Some lakes have been formed by volcanoes. Some volcanoes have blown off their tops in huge explosions. Others have had their centers collapse. Both of these events form large pits called craters. These craters can become lakes. Crater Lake, in the U.S. state of Oregon, is a well-known example of this kind of lake.

The water in lakes can come from a variety of sources. The main sources of lake water include precipitation (rain or snow), rivers and streams, and melting ice and snow. Groundwater (water below Earth's surface) can reach lakes through openings called springs.

Saltwater Lakes

Not all lakes contain freshwater. The Dead Sea, in Israel and Jordan, is the world's saltiest natural lake. Another body of salt water is the Great Salt Lake in the U.S. state of Utah. It is all that remains today of what was once a much larger freshwater lake. The lake shrank as the climate became drier and the water began to evaporate. The lake contained salt from rivers that flow into it. As the water evaporated, the salt was left behind.

A sailboat floats on a lake in Wisconsin.

Why Lakes Are Important

Freshwater lakes have many important uses. Cities and towns depend on them for drinking water. In dry areas farmers use lakes to water their crops through irrigation systems. Lake water is used to create power in hydroelectric plants. Boaters and swimmers use lakes for recreation.

Lamprey

Lampreys are fish that look like eels. They live in mild waters throughout the world, except in Africa. There are more than 20 species, or kinds, of lamprey. Some live in freshwater and others live in salt water.

Lampreys do not have bones or jaws. The skeleton is made up of a material called cartilage. Adults are about 6 to 40 inches (15 to 100 centimeters) long. They have one or two fins on the back and a single tail fin. They breathe through gill openings on the sides of the body. The mouth is round with horny teeth.

All lampreys hatch from eggs laid in freshwater. They begin life as wormlike organisms called larvae. After several years the larvae change form and

A lamprey (top) feeds on a rainbow trout.

become adults. This process is called metamorphosis.

As adults some lampreys become parasites. Parasites are organisms that live on or inside another organism to get what they need to live. The lamprey attaches itself by its mouth to the side of a fish. It makes a hole in the fish's body and sucks its blood and body fluids. The fish may or may not die.

Some lampreys stay in freshwater, but others swim out to sea. The lampreys that move into the sea return to freshwater to lay their eggs. Lampreys die soon after laying their eggs.

Eel • Fish • Parasite

Landslide

A landslide is a large amount of earth, rock, and other material that moves down a steep slope. Landslides happen when a layer of earth or rocks separates from the layer below it. The force of gravity pulls the loose layer downward.

A landslide destroyed part of a town near San Salvador, El Salvador, in 2001. An earthquake caused the landslide.

Landslides can be highly destructive. They can bury or sweep away everything in their path. They can block rivers or cover entire towns.

A landslide needs a steep slope to get its start. Rain, wind, waves, and other natural processes can wear away the surface of a slope. This wearing away, or erosion, can make a slope too steep to support the rocks and earth on top. Erosion can also loosen or weaken the material on a slope. This makes it easier for gravity to pull the material down the slope.

Besides erosion, other forces can lead to landslides. Rainstorms, melting snow, and earthquakes can weaken the material on a slope. Earthquakes, volcanoes, and the use of construction equipment or explosives can force material down a slope.

Rockfalls, mudflows, and avalanches are similar to landslides. A rockfall involves large rocks falling from the top of a slope or a cliff. A mudflow is a thick

stream of mud and other material that moves quickly downward. An avalanche is the sudden downward movement of snow or other material.

Language

Language is a system that people use to communicate, or share information. Language includes speaking, writing, and making gestures, or body movements. Early human ancestors began using spoken language several million years ago. Humans began writing about 5,000 years ago. Language made it possible for human societies to develop.

Humans are born with the ability to understand language. Without any special training, children learn to speak by listening to other people's speech. Other forms of language, such as writing and sign language, must be taught.

Three girls use language to communicate. Children usually begin to speak between ages 1 and 2. They understand some language even earlier.

Building Blocks of Language

The most basic part of language is a sound. Sounds can be combined into words, words can be combined into sentences, and so on.

Every language has several types of words. The most basic types of words are nouns and verbs. Nouns represent people, places, things, and ideas. Verbs describe action.

Every language has its own rules of grammar as well. These rules control the order of words in a sentence. The order of the words gives the sentence meaning.

Not all languages are spoken. In sign language, hand movements stand for letters, words, and sentences. Many people who use spoken language also communicate through gestures. For example, in many countries, nodding the head up and down means “yes.”

Languages of the World

There are thousands of languages throughout the world. Some are spoken by millions of people. Mandarin Chinese, English, and Spanish are the most widely spoken languages in the world.

Most countries have a standard, or official, language so that citizens can understand each other. Some countries have more than one standard language. Canada, for example, has two standard languages: English and French.

Many languages are related. People who study languages group related languages

A sign in the U.S. state of California says “polling place” in seven languages. English is at the top. Chinese, Japanese, and Korean are on the left. Spanish, Tagalog, and Vietnamese are on the right.

together. English, German, and Swedish belong to the Germanic group. French, Spanish, and Italian are called Romance languages. The Slavic language family of eastern Europe includes Russian and Polish. Chinese belongs to the Sino-Tibetan language family of Asia.

How Language Changes

At times people need to speak with others who do not know their language. For example, Europeans who came to the Americas hundreds of years ago needed a way to speak with Native Americans. Over time they began to use a simplified mixture of their languages. These mixtures are called pidgin languages. When a pidgin language replaces the original language of the group, it is called a creole language.

Even people who share the same language may develop different ways of speaking. People in different parts of a country may pronounce words differently or use local expressions. These varieties of the same language are called dialects.

Languages often blur together. Countries have borders, but languages and dialects do not. One language may borrow words from another language. Many English speakers use such words as pajamas (from Hindi), pasta (from Italian), karate (from Japanese), and fiesta (from Spanish).

Languages grow and change as people use them. People often shorten existing words. For example, “cellular phone” was shortened to “cell phone.” Also, people create new words all the time.

Lansing

Population
(2000 census)
119,128;
(2007 estimate)
114,947

Lansing is the capital of the U.S. state of Michigan. Lansing itself was called Michigan until 1848. The city lies in a

Michigan's state Capitol is in a park in the center of Lansing.

shallow valley that is shaped like a cup. The Grand and Red Cedar rivers flow through the city.

The state Capitol stands in Capitol Square, in the center of the city. The building was completed in 1878.

Businesses that provide services are important to Lansing's economy. Many people there work in government, banking, insurance, computers, and education. Michigan State University is in the nearby city of East Lansing. Factories in Lansing make cars and other products.

Lansing was settled in the 1830s. In 1847 the state capital was moved to Lansing from Detroit. The site at that time was still mostly wilderness. In the early 1900s a company started to make cars called Oldsmobiles in Lansing. After that the city's industries began to grow.

Laos

People can climb to the top of the Patuxai Arch in Vientiane, Laos, for a clear view of the city.

Laos is a country of Southeast Asia. It was once a powerful kingdom. Later it was ruled by Thailand and then France before regaining its independence. Vientiane is Laos' capital and largest city.

Laos borders China, Vietnam, Cambodia, Thailand, and Myanmar. The Mekong River forms part of Laos' western border. Lowlands lie along the

Mekong. Forested mountains cover the rest of the land.

Teak trees grow in the south. In the north are tropical rain forests. Elephants, tigers, leopards, monkeys, bears, and deer live in the forests.

Most of Laos' people live in rural areas. The Lao-Lum people form the largest ethnic group. The next largest groups are the Lao-Theung (or Mon-Khmer), the Lao-Tai, and the Lao-Soung. Most people are Buddhists or spirit worshippers. The main language is Lao.

Laos is a poor country with an economy based on farming. The chief crop is rice. Other crops include sugarcane, corn, sweet potatoes, and pineapples. Many people fish and raise pigs, water buffalo, and cattle. Laos also produces clothing, wood, coffee, and tin.

The rulers of Lan Xang (Kingdom of the Million Elephants) unified Laos in the 1300s. Later kingdoms fell under the rule of Siam (now Thailand). France ruled the region from the late 1800s.

Laos gained independence in 1954. In 1975 a Communist group called the Pathet Lao took control. The new government ruled harshly, and many people fled. A new constitution in 1991 gave the people more freedom.

The South American country of Bolivia has two capitals: La Paz and Sucre. The country's president and lawmakers meet in La Paz. It is the administrative capital. The Supreme Court of Bolivia meets in Sucre, the legal capital.

La Paz is the highest national capital in the world. It lies more than 10,000 feet (3,050 meters) above sea level. Most of La Paz is located within a canyon.

La Paz is a center of business and industry. Many people in the city work in government and business offices, schools, hotels, stores, and banks. Factories in La Paz make processed foods, cloth, jewelry, and other goods.

Aymara Indians have long lived in the La Paz area. Hundreds of years ago the Inca had a village on the site. A Spanish conqueror founded the city in 1548. He named it Nuestra Señora de La Paz, which means "Our Lady of Peace." Spain ruled the area until 1825. In that year Bolivia became an independent country. La Paz became its administrative capital in 1898.

Larch

Larches are trees that belong to the pine family. They are conifers, which means that they grow cones. Most conifers are evergreens, or trees that keep their leaves all year long. Larches are unusual because they shed their leaves in the autumn.

Larches grow mainly in cool areas in the northern half of the world. One species, or kind, of larch grows only in the Himalaya Mountains of southern Asia.

Skyscrapers line the streets of La Paz, Bolivia.

Larches' needle-shaped leaves change color and fall off in the autumn.

Larches have needle-shaped leaves that grow in clusters. New cones on the trees are bright red. Later the cones turn brown.

There are 10 to 12 species of larch. The most common North American larch is the eastern larch, also called the tamarack or hackmatack. It takes about 100 to 200 years for the eastern larch to become fully grown. In that time it may reach a height of 40 to 100 feet (12 to 30 meters). Two other kinds of larch, the western larch and the European larch, grow even taller. The European larch may grow as tall as 140 feet (42 meters).

The wood of larches is strong, hard, and heavy. It is used to make ships, telephone poles, and railroad ties.

La Salle, Sieur de

The French explorer known as the Sieur de La Salle was the first European to

travel down the Mississippi River to the Gulf of Mexico. He claimed for France all the land that was drained by the river.

Early Life

La Salle was born on November 22, 1643, in Rouen, France. His original name was René-Robert Cavelier. In 1666 he went to Canada and traded for furs. Native Americans told him of a broad river that ran from the Great Lakes region to the sea. This was the Mississippi.

Explorations

In 1669 La Salle traveled south from Lake Ontario. He did not reach the Mississippi, but he may have reached the Ohio River. In 1673 he helped to build Fort Frontenac on Lake Ontario.

An illustration from the late 1600s shows the Sieur de La Salle at the coast of the Gulf of Mexico.

A map shows the route taken by the Sieur de La Salle down the Mississippi River. It also shows the route of La Salle's last, failed voyage.

In 1674 and 1677 La Salle visited France. King Louis XIV gave him the title of Sieur de La Salle, which means Sir La Salle.

In 1682 La Salle reached the Mississippi from the Illinois River. He floated all the way to the river's mouth at the Gulf of Mexico. There, on April 9, 1682, he claimed the entire Mississippi River valley for France. He named it Louisiana after his king.

Last Voyage

La Salle then returned to France. The king gave him permission to build a fort at the mouth of the Mississippi and to invade the Spanish land of Mexico.

La Salle's expedition set out from France planning to sail through the Gulf of Mexico to the mouth of the Mississippi. On the way, several of La Salle's ships were lost. Many men became ill. Worst of all, La Salle could not find the Missis-

issippi River. He finally landed at Matagorda Bay, in what is now Texas. His men grew so angry that they murdered La Salle on March 19, 1687.

Laser

A laser is an instrument that can produce a powerful beam of light. The word laser stands for the scientific words that explain how a laser beam is produced: “*light amplification by the stimulated emission of radiation.*”

In the 1950s scientists in the United States and the Soviet Union came up with the ideas needed to build lasers. A U.S. scientist built the first laser in 1960. Since then scientists have built many more types of lasers.

How Lasers Work

A laser is usually made up of a tube with mirrors at both ends. One mirror is partly transparent (see-through). Inside

The light that escapes out of one end of a laser's tube is called a laser beam.

the tube is some type of material, such as gas, crystal, or liquid.

A powerful lamp or some other source of energy adds energy to the material. Then the material produces light. The light bounces back and forth between the mirrors at the ends of the tube. As it does so, it causes the material in the tube to produce more light. Some of this light escapes through the partly transparent mirror.

The escaped light is known as a laser beam, or laser light. Laser light is different from sunlight or light from a lamp, which is called white light. White light contains a mixture of all the wavelengths, or colors, of light. Laser light contains only one color. In addition, white light spreads out and gets weaker as it travels away from its source. Laser light travels from its source in a straight line. This helps it keep its strength over very long distances.

Uses

Construction workers and scientists use lasers to measure distances. Laser light can also carry telephone signals and other information over long distances. In this case it travels through special cables, called fiber-optic cables.

Doctors sometimes use laser beams instead of scalpels (knives) to cut into people. The energy of a laser beam can also close cuts without stitches.

Another common use of laser light is to make and read compact discs—CDs and

Did You Know?

Laser radar measured the distance from Earth to the Moon in the 1960s.

DVDs. Some types of computer printers use lasers, too.

Latin America

Latin America is a region made up of Mexico, Central America, and South America. Some of the islands of the West Indies, in the Caribbean Sea, also are included. The area is known as Latin America because most people speak languages that came from Latin (the language of the ancient Romans). These languages include Spanish, Portuguese, and French.

People

Many Latin Americans have a mixture of American Indian, European, and African ancestry. Most people speak Spanish or

Portuguese. People in French Guiana and parts of the West Indies speak French. Millions of American Indians speak their native languages. Most Latin Americans are Roman Catholic.

History

American Indian peoples lived in what is now Latin America for thousands of years before Europeans arrived. These peoples included the Maya, the Aztec, the Inca, and many others.

In 1492 Christopher Columbus landed in the West Indies. This voyage marked the beginning of European exploration in the Americas. The Spanish conquered much of Latin America in the 1500s. Many American Indians died while fighting the Europeans or from the diseases they brought from Europe.

Eventually, Spain ruled Mexico, Central America, much of South America, and parts of the West Indies. Portugal ruled Brazil. France claimed what is now French Guiana and several islands in the

A Roman Catholic church in Guatemala is colorfully decorated. Latin America has a mixture of European and American Indian cultures.

A group of musicians plays together in Mazatlán, Mexico.

Caribbean. Many Europeans settled in these areas. They brought their languages, their Roman Catholic religion, and their culture to the region. Europeans also brought in many Africans as slaves.

Most of Latin America gained independence from Europe in the 1800s. But in many places in the region, people with European roots still held more power than people with American Indian or African ancestors.

Latitude and Longitude

Latitude and longitude are a system of lines used to describe the location of any place on Earth. Lines of latitude run in an east-west direction across Earth. Lines of longitude run in a north-south direction. Although these are only imaginary lines, they appear on maps and globes as if they actually existed.

Latitude

Lines of latitude (also called parallels) circle the Earth parallel to the equator. The equator is an imaginary line that lies halfway between the North Pole and the South Pole. It runs east-west all the way around Earth. Lines of latitude describe positions north and south of the equator.

© 2006 Encyclopædia Britannica, Inc.

Lines of latitude run east and west.

Lines of latitude are measured in degrees ($^{\circ}$). Degrees are broken down into smaller units called minutes ($'$) and seconds ($''$). The equator is 0° . The North Pole is 90° north (N), and the South Pole is 90° south (S). Lines of latitude north of the equator are numbered from 1° to 89° N. Lines of latitude south of the equator are numbered from 1° to 89° S.

There are other important lines of latitude besides the equator. For example, the Arctic Circle ($66^{\circ} 30' \text{ N}$) and the Antarctic Circle ($66^{\circ} 30' \text{ S}$) surround the cold regions around the North and South poles. The area between the Tropic of Cancer ($23^{\circ} 27' \text{ N}$) and the Tropic of Capricorn ($23^{\circ} 27' \text{ S}$) is called the tropical zone or the tropics. It is known for its generally hot weather.

Longitude

Lines of longitude run between the North Pole and the South Pole. These lines are also called meridians. Like lines

of latitude, meridians are measured in degrees, minutes, and seconds.

The north-south line that marks 0° longitude passes through Greenwich, England, in Great Britain. This is called the Greenwich, or prime, meridian. Other lines of longitude describe positions east and west of the prime meridian. Lines of longitude east of the prime meridian are numbered from 1° to 179° east (E). Lines of longitude west of the prime meridian are numbered from 1° to 179° west (W). The 180th meridian, or 180° , is the line of longitude exactly opposite the prime meridian.

How the Two Work Together

Latitude and longitude together can describe the exact location of any place on Earth. For example, Washington, D.C., lies 39 degrees north of the equator and 77 degrees west of the prime meridian. Its position is 39° N , 77° W .

Latvia

A castle in Cesis, Latvia, was built by German knights in the 1200s.

The eastern European country of Latvia lies on the eastern shore of the Baltic Sea. For much of its history Latvia has been controlled by foreign powers. In 1991 it achieved independence from the Soviet Union. The capital is Riga.

Geography

Latvia is between the two other Baltic countries, Estonia (to the north) and Lithuania (to the south). Russia and Belarus are to the east. The land includes

flat lowlands and hills. Winters are cold, and summers are cool and rainy.

Plants and Animals

Forests cover much of Latvia. They are home to elk, boars, foxes, hares, lynx, badgers, and ermines (a type of weasel).

People

Ethnic Latvians, or Letts, make up more than half the population. They speak Latvian. Russians form the next largest group. More than half of the people are not religious; most of the others are Christians. Most people live in cities.

Economy

Services, including education, transportation, and banking, are the main economic activities. Manufacturing is also important. Latvia produces wood, metals, clothing, and machinery.

History

The first people in what is now Latvia were the ancient Balts. In the 800s the Vikings took control of the region. Germany, Poland, and Sweden later ruled. By the end of the 1700s Russia controlled all of Latvia.

In 1917 Latvia declared its independence. In 1940 the Soviet Union invaded. Latvia finally gained independence in 1991.

Laurel

Many types of flowering plant are known as laurels. The true laurel is a shrub or a small tree that is also called the bay laurel or sweet bay. It belongs to a large family of plants known as the laurel family. Some of the other plants called laurels belong to this family, but others are in different families.

Bay Laurel

The bay laurel first grew in regions around the Mediterranean Sea. Today it also grows in other parts of Europe and in the Americas. The bay laurel has stiff, fragrant leaves. It is evergreen, which means that it keeps its leaves year-round. The bay laurel also grows small, yellowish green flowers and green, purple, or black berries.

People use dried leaves of the bay laurel, called bay leaves, to flavor stews, sauces, and pickles. In ancient Greece the winners of athletic and poetry contests wore crowns of bay laurel.

Other Laurels

Like the true laurel, all the other plants known as laurels are evergreen. The Canary Island, or Azores, laurel is closely related to the true laurel. The California laurel is not as closely related, but it belongs to the laurel family.

Several plants in the heath family are known as laurels. They include the mountain laurel, the sheep laurel, and the pale laurel. These shrubs are highly poisonous to animals. Other laurels in

Small flowers bloom on a branch of bay laurel.

the heath family include ground laurel and great laurel.

Other plant families also include plants called laurels. The cherry laurel and the Portugal laurel belong to the rose family. The spurge laurel is in the thyme family. The Japanese laurel belongs to the dogwood family. The New Zealand laurel, or karaka, is related to holly.

Law

All modern governments have sets of rules called laws. Laws are based on ideas about what is right and wrong. Governments punish people who do not obey laws. People who work with laws are called lawyers. The collection of all the laws in a country or a region is called the law.

Where Laws Come From

In the past, many laws were based on tradition, or the common practices of a

Did You Know?

The bay laurel was sacred to the ancient Greek god Apollo.

people. Other laws came from rulers or lawgivers. Units of government called legislatures make most modern laws. The United States and many other countries have several levels of legislatures—for example, local, state, and national. All of them make laws.

The United Kingdom and some other countries, including the United States, do not get all their laws from legislatures. They also get laws from the decisions of judges.

Branches of Law

There are two main branches of law: criminal and civil. Criminal law deals with crime. The government usually puts people accused of breaking criminal laws on trial in a court. If the court finds an accused person—called the defendant—guilty, he or she is pun-

A stone carving shows Hammurabi, the king of Babylon, standing before a god. Hammurabi created one of the first collections of written laws in about 1800 BC.

ished. Punishment may be a fine of money, a prison term, or death.

Civil law deals with disagreements between people. People file a lawsuit in a civil court if they think someone has treated them unfairly. The person who files the suit is called the plaintiff. Usually the plaintiff wants money from the other person—called the defendant.

History of Law

Hammurabi, the king of Babylon in Mesopotamia, created one of the first codes, or collections, of written laws in about 1800 BC. In the democracies of ancient Greece the citizens agreed on the laws that would govern them.

Many modern countries use either the English or the French system of law. Colonists brought English laws with them to North America and other places. In Europe and Latin America, many countries base their laws on the Napoleonic Code. The French emperor Napoleon I introduced this code of laws in 1804.

Crime • Government • Legislature

Leaf

The leaf is one of the most important parts of a plant. Leaves produce food for the plant through a process called photosynthesis. The leaves of different plants vary widely in size, shape, and color.

Did You Know?

Lawyers, also called attorneys, give people advice about laws. They also represent people, businesses, and governments during lawsuits.

Leaves come in many different shapes. They may grow in several different arrangements.

Structure

Most leaves have a broad, flat part called a blade. Usually, a stalk attaches the blade to the plant's stem. This stalk is called a petiole. A leaf that has only one blade is called a simple leaf. A compound leaf has two or more blades attached to the petiole.

Veins inside a plant's leaves work much like blood vessels inside an animal's body. They carry water and food to and from the leaves. Veins also provide the strong support that gives a leaf its shape. The veins of broad leaves usually form a netlike pattern throughout the leaf. Narrow leaves usually have veins that lie parallel to each other.

Different types of leaves may be rounded, oval, spear shaped, heart shaped, or triangular. Some leaves look

almost like fingers on a hand. Others are shaped like needles. Some leaves have smooth edges. Other leaves have tiny points, called teeth. Leaves may also have waxy or hairy coverings for protection.

Photosynthesis

Inside all leaves are substances called pigments, which give leaves their colors. Green leaves get their color from a green pigment called chlorophyll. Chlorophyll helps with the job of photosynthesis. It absorbs energy from sunlight. The leaves use this energy to make sugars, which are food for the plant.

Falling Leaves

Plants lose leaves and grow new ones throughout their lives. But many trees, called deciduous trees, shed all their leaves during cold or dry seasons. Trees

Did You Know?

Most plants twist and bend their leaves to face the sun. This helps them absorb more sunlight.

do this because they stop growing during these times.

In autumn or during a dry season, the leaves of deciduous trees lose their chlorophyll. As the leaves' green color fades, red, yellow, or orange pigments become visible. Meanwhile, a weak layer of cells develops at the base of each leaf's petiole. This weak layer causes the leaf to loosen and then fall off. The leaves grow back when the seasons change again.

Photosynthesis • Plant • Tree

League of Nations

The countries that won World War I (1914–18) set up an organization called the League of Nations. They wanted the League to be a place where countries could settle disagreements by talking instead of fighting. However, the League was not strong enough to keep World War II from breaking out in 1939.

The first meeting of the League of Nations was held in Geneva, Switzerland, in 1920. Representatives from 42 countries attended. More than 20 other countries joined later. U.S. President Woodrow Wilson wanted the United States to join the League, but the U.S. Congress disagreed. The United States never joined.

Representatives from many countries attend a League of Nations meeting in about 1930.

The League's goal was to prevent wars. The member countries agreed to discuss with the League any dispute that might lead to war. The members also agreed to act together against a country that was making trouble. In addition, the League tried to get countries to reduce their number of weapons.

In the 1920s the League settled several disputes between nations. In the 1930s, however, the League faced new challenges. Japan, Italy, and Germany invaded other countries. The League could not stop them. The invasions led to World War II.

The League's failure to prevent the war showed how weak it had become. The League did not meet during the war. After the war, in 1946, it was replaced by a new organization, the United Nations.

Lebanon

The Middle Eastern nation of Lebanon lies on the eastern shore of the Mediterranean Sea. Lebanon has a large population for its small area. Problems between its Muslim and Christian people led to a long civil war that lasted from 1975 to 1991. Lebanon's capital and largest city is Beirut.

Geography

Lebanon borders Israel and Syria. Along the Mediterranean coast is a narrow plain. The Lebanon Mountains, which rise to 9,800 feet (3,000 meters), run down the middle of the country. The Anti-Lebanon Mountains form Lebanon's border with Syria. Between the two mountain ranges lies the high, fertile Bekaa Valley. The valley receives water from the Litani, the only river in Lebanon that flows throughout the year.

Lebanon's coast has warm, dry summers and mild, rainy winters. Summers in the

The city of Sidon, Lebanon, lies on the coast of the Mediterranean Sea. Christian knights built castles in Sidon in the 1200s.

Bekaa Valley are hot and dry, and winters are cool. Lebanon receives more rain than most Middle Eastern countries.

Plants and Animals

Lebanon was once heavily forested. But loggers cut down many trees over thousands of years. Today forests cover about 8 percent of the land. Among Lebanon's plants are brush and low trees, including oaks, pines, cypresses, firs, and junipers. Lebanon is famous for its cedar trees, but today they grow only in protected mountain groves.

Lebanon's animals include deer, wildcats, hedgehogs, squirrels, martens (small weasel-like mammals), and hares. Flamingos, pelicans, cuckoos, and various birds of prey also live there.

People

Most Lebanese are Arabs. There are small groups of Armenians and Kurds. Arabic is the main language, but many people speak English and French. Muslims make up more than half of the population. Most of the rest of the people are Christians. A smaller number of people are Druze—followers of a religion that combines elements of Islam, Christianity, Judaism, and other faiths. About 90 percent of Lebanese live in cities, mainly along the coast.

Economy

Services, including banking and tourism, are Lebanon's most important economic activities. Manufacturing is also important. Lebanon produces cement, food products, jewelry, clothing, machinery, chemicals, and wood products.

Agriculture is concentrated along the Mediterranean coast and in the Bekaa Valley. Major crops include potatoes, tomatoes, cucumbers, citrus fruits, onions, grapes, apples, and olives. Goats and sheep are the main livestock.

History

In early times the Phoenicians, Greeks, Romans, and Byzantines ruled what is now Lebanon. In 1516 the Turks made the region part of the Ottoman Empire. After World War I France governed Lebanon. The country became independent in 1943.

After independence, tensions grew between Christians and Muslims. In

1970 the Palestine Liberation Organization (PLO) moved its headquarters to Lebanon. The PLO launched attacks on Israel from Lebanon. Lebanese Muslims allied with the Palestinians against Israel and the Lebanese Christians. The Lebanese Muslims also wanted more power in Lebanon's Christian-dominated government.

In 1975 the conflict escalated into civil war between Muslims and Christians. The following year Syrian forces entered Lebanon to support the Christians. In 1982 Israeli forces also invaded. The Israelis and an international peacekeeping force helped to drive the PLO out of Lebanon. In 1984 the international peacekeepers left the country. Fighting between Lebanon's religious groups continued, however.

The civil war ended in 1991, but violence continued in southern Lebanon, especially between Israeli forces and the radical Muslim group known as Hezbollah. In 2000 Israel finally withdrew its forces from southern Lebanon. Syria pulled out its troops in 2005. About 300,000 Palestinian refugees remained in Lebanon, however.

In 2006 Hezbollah captured two Israeli soldiers. This led to heavy fighting between Israel and Hezbollah. Beirut and southern Lebanon were greatly damaged during the conflict.

Lee, Robert E.

General Robert E. Lee is pictured in the uniform of the Confederate Army.

General Robert E. Lee led Southern armies during the American Civil War (1861–65). Even though his side had fewer soldiers and less money than the Union (the North), he scored many victories.

Early Life

Robert Edward Lee was born in Stratford, Virginia, on January 19, 1807. His father was Henry Lee, a hero of the American Revolution. Robert graduated from the U.S. Military Academy in 1829.

Career

Lee served for 36 years in the U.S. Army. He fought in the Mexican War (1846–48). He also captured John Brown, the leader of an antislavery revolt, in 1859.

In 1861 a group of Southern states formed their own government after separating from the United States. The new government was called the Confederacy. Virginia joined the Confederacy, and it soon became clear that the two sides were going to war. Lee wanted to defend his home state, so he left the U.S. Army. He took command of the Army of Northern Virginia in June 1862.

Lee won great victories in Virginia. One was the second battle of Bull Run (August 1862). Another was the battle of Chancellorsville (May 1863).

Lee invaded the North twice, but Northern forces stopped him both times. The second defeat—at Gettysburg, Pennsylvania, in July 1863—was a turning point in the war.

After Gettysburg, Lee defended northern Virginia. He finally surrendered to General Ulysses S. Grant at Appomattox Court House, Virginia, on April 9, 1865.

Later Years

Lee was a hero to Southerners even in defeat. He became president of Washington College at Lexington, Virginia. The school was later renamed Washington and Lee University. Lee died on October 12, 1870, in Lexington, Virginia.

Leg

The limbs called legs support an animal's body and allow it to move. Animals use legs to walk, run, and jump. Humans have two legs. Other mammals, such as horses and cats, have four legs. Their two front legs are called forelegs, and their two back legs are called hind legs. Other animals have four, six, eight, or even hundreds of legs.

Legs of Mammals

The legs of all mammals share the same basic structure. A knee joint links the upper and lower segments of each leg. At the bottom of each leg is a foot. Muscles make the legs move. Bones make them strong.

On four-legged mammals, the legs are attached underneath the body. The hind legs of these mammals resemble the legs of humans. Three long bones are found in hind legs and in human legs: the tibia, the fibula, and the femur. The tibia and the fibula connect the ankle to the knee. The femur connects the knee to the pelvis.

The forelegs of four-legged mammals can be compared to human arms. Like arms, forelegs can hit, pull, and dig. But forelegs also support and move the body. The bone in the upper foreleg is called the humerus. The humerus connects the scapula (shoulder blade) to the knee. The radius and the ulna connect the knee to the ankle.

Most animals that live on land have legs. Legs support an animal's body and allow it to get around.

Legs of Other Animals

Amphibians, reptiles, and arthropods—which include insects, spiders, crustaceans, and centipedes—also have legs. Like mammals’ legs, most have muscles, joints, and segments. However, these animals’ legs are usually attached to the sides of the body, not underneath. Most amphibians and reptiles have four legs. Arthropods have from three to about 200 pairs of legs. Arthropods’ legs have a hard outer covering instead of bones inside.

Birds have two hind legs, also with muscles, bones, joints, and segments. They are located under the body. Instead of forelegs, birds have wings.

Legislature

The group within a government that makes the laws is called a legislature. Republics and most modern monarchies have legislatures. States and provinces

Members of Israel’s legislature stand after hearing a speech by a foreign leader. The legislature is called the Knesset.

have them too. Old-fashioned monarchies do not need legislatures because the ruler makes the laws.

Many countries have adopted legislative systems similar to that of either the United States or Great Britain. The United States legislature is called Congress. Great Britain’s legislature is called Parliament.

The United States separates the legislative branch from the rest of the government. In the United States, the president is not allowed to be a member of Congress. In Great Britain it is different. The prime minister has to be a member of Parliament.

Many legislatures consist of two groups, or houses. In the United States and Great Britain, the lower house has members who are elected from districts. The residents of a district vote for a member to represent them. The upper houses are chosen by other methods.

Israel, like many other small countries, has a one-house legislature. Israel’s legislature is called the Knesset. There are no election districts. People vote for a party rather than a candidate. A party gets the same share of Knesset members as its share of the nationwide vote. This system allows small parties to have members in the legislature.

Legislatures may have other duties besides making laws. The U.S. Congress, for example, must approve officials and judges who have been appointed by the president. It also has the power to

remove government officials from office or to declare war.

Legume

Legumes are flowering plants of the pea family. The pods, or fruits, of these plants are also called legumes. There are more than 18,000 species, or types, of legume. Some well-known legumes include beans, peas, peanuts, and soybeans.

Legumes grow all over the world. Most types grow naturally in warm or tropical areas. Most of the legumes that are valuable as crops are grown in mild climates.

Peas are legumes. The pods of a pea plant split open to release the seeds, or peas, inside.

Legumes can grow as herbs, vines, shrubs, or large trees. Most have soft green stems and flowers with five petals. The flowers later grow into pods, which hold the plant's seeds. Pods come in a variety of shapes, sizes, and textures. A pod releases its seeds by splitting open along two seams.

Legumes are an important source of food because they are high in protein. Beans, peas, and peanuts are legumes that people commonly eat. Soybeans are used to make such foods as tofu, soy milk, ice cream, and soy sauce. Soybeans are also used to feed livestock. Alfalfa and clover are used as livestock feed, too.

Legumes also are useful in improving the soil. They do this by adding nitrogen to the soil. Nitrogen is a nutrient that is important to all living things. The air has a lot of nitrogen, but most organisms cannot use it in that form. Most plants get their nitrogen from the soil. But legumes can take nitrogen from the air. In the roots of legumes, special bacteria turn the nitrogen into a form that plants can use. When legumes are plowed into the soil, they release nitrogen. Other plants can then take up the nitrogen through their roots.

Leif Eriksson

Leif Eriksson was probably the first European to visit North America. He was a Viking. The Vikings were warriors

Did You Know?

The protein content of soybeans is twice as high as that of meat.

An illustration from the 1800s shows Leif Eriksson and his Viking ship at sea.

from northern Europe who traveled far by sea during the Middle Ages.

Leif was born on the island of Iceland sometime before AD 1000. He grew up on the nearby island of Greenland. His father, Erik the Red, had started a Viking settlement there.

There are two different tales of Leif's North American voyage. According to one tale, he got lost while on a mission to bring the Christian religion to Greenland. He landed on an unknown shore that he called Vinland because he saw grapevines there. Vinland might have been where Nova Scotia, Canada, is today.

According to a second tale, another Viking saw Vinland first and told Leif about it. In about AD 1000 Leif got together a group of explorers. The group reached Vinland and other places as well. Leif called one place Helluland. Helluland might have been the part of eastern Canada that is now called Labrador. Leif named another place Markland. Markland might have been the

island of Newfoundland. Many scholars believe the second tale is closer to the truth.

Leif returned to Greenland after his famous voyage. Other Vikings later started settlements in North America. Scientists have found traces of a Viking settlement on the island of Newfoundland. These settlements did not last long, however. They were gone long before the next group of Europeans arrived in the area in the late 1400s.

Lemming

Lemmings are small rodents that resemble mice. They live in the northern parts of North America, Europe, and Asia. They are known for migrating, or

Lemmings usually live on their own or in small groups. But sometimes large numbers of lemmings gather together and move to a new area.

moving from place to place, in huge groups.

Lemmings are about 4 to 7 inches (10 to 18 centimeters) long, including the short tail. The body is chunky, which helps the animal stay warm in cold weather. The soft fur is grayish or reddish brown on top and lighter below. The fur gets thicker in winter to help keep them warm. Many lemmings living in the Arctic have fur that turns white in winter.

Lemmings live in holes that they dig in the ground. In winter they tunnel under the snow. Lemmings eat mosses, roots, and grasses.

Every three or four years the number of lemmings increases greatly. Scientists are not sure why. When the lemming population grows, some lemmings migrate to new areas.

Many people believe that lemmings purposely drown themselves during their migrations by plunging into the sea. This is untrue. In fact, lemmings try to avoid water. But sometimes a river or another body of water gets in their way. Then they might drown accidentally while trying to swim.

Lemon

Lemons are tart, yellow fruits that grow on a small tree or spreading bush. Like limes, oranges, and grapefruit, lemons

Ripe lemons hang from a lemon tree.

are citrus fruits. The lemon plant's scientific name is *Citrus limon*.

Lemons grow in many warm regions of the world. Major lemon-growing countries include India, Argentina, Spain, Iran, and the United States. In the United States most lemons grow in California and Arizona.

Lemon trees grow to about 10 to 20 feet (3 to 6 meters) high. They produce sweet-smelling flowers that are white on top and reddish purple on the bottom. The fruits, or lemons, grow from these flowers.

Lemons are shaped like an oval with a bump on one end. Their rind, or skin, is thick. It starts out green and turns yellow when the fruit is ripe. Inside each fruit is juicy flesh called pulp.

The juice of lemons is tart because it contains a substance called citric acid. Lemon juice is rich in vitamin C as well. People use lemon juice to flavor pastries, pies, vegetables, fish, and many other foods. They mix it with water and sugar

to make lemonade, a popular warm-weather drink. People also use lemons to make fruit jellies, soaps, perfumes, and medicines.

Lemur

Lemurs are mammals known for their large eyes and monkeylike bodies. They belong to the group of animals called primates, along with lorises, tarsiers, monkeys, apes, and humans. There are about 18 species, or types, of animal in the lemur family. But the term lemur also applies to about 50 related species, including dwarf lemurs, mouse lemurs, koala lemurs, indris, and aye-ayes.

Lemurs are found only on the islands of Madagascar and Comoros off the eastern coast of Africa. Most lemurs live in trees in forests. But the ring-tailed lemur lives in rocky areas.

A red-bellied lemur rests in a Madagascar rain forest. Lemurs use their long tails for balance while moving through the trees.

Most lemurs have foxlike faces and long back legs. They range in length from about 2.5 inches (6 centimeters) in one kind of mouse lemur to nearly 27.5 inches (70 centimeters) in the indri. This does not include the tails. The bushy tails of some lemurs are longer than their bodies. But the indri has a very short tail. The ring-tailed lemur is the only lemur with a striped tail. Most lemurs have a woolly coat that is mainly reddish, gray, brown, or black.

Lemurs are gentle and often social animals. Some species live in groups of 10 or more individuals. Most kinds are active at night and sleep during the day. Lemurs may eat fruits, leaves, buds, insects, and small birds and birds' eggs.

Loggers and farmers have cut down many trees where lemurs lived. Several species are now endangered, or at risk of dying out completely.

L'Engle, Madeleine

The U.S. author Madeleine L'Engle wrote many books, including collections of poetry and novels for adults. She is best known, however, for many books she wrote for children. The most famous is a fantasy called *A Wrinkle in Time*. The book was published in 1962. The American Library Association honored the book with its Newbery Medal in 1963.

Madeleine L'Engle Camp was born on November 29, 1918, in New York City. As a writer she used only her first and middle names. She began making up stories while very young. Following her graduation from Smith College in 1941, L'Engle acted in theater. She published her first adult book, *The Small Rain*, in 1945.

L'Engle married Hugh Franklin in 1946. They soon moved to the country. Her first children's book, *And Both Were Young*, was published in 1949. While her children were young L'Engle did not publish many books. However, she kept on writing, and many of the books she wrote have to do with family ties. After *A Wrinkle in Time* L'Engle wrote more stories about the same family that she introduced in that book. Those books include *A Wind in the Door* (1973), *A Swiftly Tilting Planet* (1978), and *Many Waters* (1986). She also wrote another series for children about a family called the Austins. In addition L'Engle wrote plays, poetry, and books about herself.

Madeleine L'Engle

Lenin, Vladimir Ilich

Vladimir Ilich Lenin

The Russian leader Vladimir Ilich Lenin was the founder of the Soviet Union. The Soviet Union was the world's first Communist country.

Early Life

Lenin was born on April 22, 1870, in Simbirsk, Russia. His original name was Vladimir Ilich Ulyanov. At the time, Russia was ruled by a tsar. Many people were unhappy with the way the tsar treated them.

Vladimir studied law at the University of Kazan but was thrown out for joining a protest. He went home and read the writings of the Communist thinker Karl Marx. Marx wrote about a system in which the wealth of a society could be shared by all the citizens. Vladimir began to think about overthrowing the tsar to establish such a system.

Rise to Power

Vladimir became a lawyer in 1892. He also worked to spread Marx's ideas. Because of this, he was arrested in 1895 and sent to jail. In 1897 he was sent to Siberia (Russian Asia). In Siberia he lived near the Lena River. Afterward he began calling himself Lenin, after the name of the river.

In 1903 the Marxists (followers of Marx's ideas) split into two groups. Lenin took the side of the Bolsheviks (the majority) against the Mensheviks (the minority).

When World War I broke out in 1914, Lenin called for workers of all countries to change their own governments instead of fighting foreigners. In other words, he called for revolution.

In 1917 a revolution broke out in Petrograd (now Saint Petersburg), Russia. The Russian Revolution forced Tsar Nicholas II off the throne. Eventually the Bolsheviks took over, and Lenin became the head of a new, Communist government.

Communist Leader

Many Russians disagreed with Lenin's government. They fought a civil war with Lenin's troops, but Lenin's forces won the war. In 1922 the Soviet Union was formed.

Lenin was a powerful leader. He did not allow any disagreement with his government. But Lenin grew weak after he had

a series of strokes. He died after a final stroke on January 21, 1924.

Lens

A lens is a piece of glass or other see-through material that is curved on one or both sides. It is usually in the shape of a circle. Lenses are used to bend light. This makes objects seen through a lens look bigger or smaller than they really are. Telescopes, binoculars, microscopes, cameras, and eyeglasses all have one or more lenses.

Concave and Convex Lenses

A concave lens curves inward. That means it is thinner in the middle than at

A convex lens bends light rays toward each other. A concave lens spreads light rays apart.

Did You Know?

After Lenin's death, the Russian city of Petrograd was renamed Leningrad. It was changed to Saint Petersburg in 1991.

A convex lens makes objects look larger and farther away. Convex lenses correct farsightedness. A concave lens makes objects look smaller and closer. Concave lenses correct nearsightedness.

the edges. When light passes through a concave lens, the light rays bend so that they spread apart. Concave lenses make objects look smaller and closer.

A convex lens curves outward. It is thicker in the middle than at the edges. When light passes through a convex lens, the light rays bend toward each other. The rays meet at a single point on the other side of the lens. Convex lenses make objects look larger and farther away.

The Lens of the Eye

The eye contains a lens that bends light rays so that they meet exactly on a part of the eye known as the retina. The shape of the lens changes to allow the eye to see objects at different distances.

If the lens does not bend light rays properly, the result is nearsightedness or farsightedness. Nearsightedness makes faraway things look blurry. It can be corrected by wearing eyeglasses with concave lenses. Farsightedness makes close-up things look blurry. It can be corrected by wearing eyeglasses with convex lenses. The lenses of both types of eyeglasses bend light rays so that they meet on the retina.

Leonardo da Vinci

Leonardo da Vinci was a genius in many fields. He excelled at painting, drawing, sculpture, architecture, and engineering. He was a leading figure of the Italian Renaissance, a period of

A self-portrait by Leonardo da Vinci shows how he looked in 1512.

Leonardo da Vinci painted *The Last Supper* on the wall of a monastery in Milan, Italy.

great achievement in the arts and sciences. Leonardo's paintings *Mona Lisa* and *The Last Supper* won him great fame. But he is also well known for his scientific studies.

Early Life

Leonardo da Vinci was born on April 15, 1452, near Vinci, in what is now Italy. When he was about 15 he began studying with the artist Andrea del Verrocchio in Florence. Verrocchio taught him about painting, sculpture, and the design of mechanical devices.

Paintings and Notebooks

Leonardo worked in Milan as a painter and engineer for a duke from 1482 to 1499. Although he completed only six paintings during that time, they include two masterpieces: *The Last Supper* and *The Virgin of the Rocks*.

While in Milan Leonardo also became interested in observing nature. He thought that by carefully observing objects and accurately drawing them, an artist could obtain scientific knowledge. Leonardo recorded his observations in a series of notebooks. The notebooks cover a variety of subjects, including painting, architecture, machinery, the structure of the human body, and the science of flight. For example, more than 300 years before flying machines were perfected, Leonardo developed plans for an airplane and a helicopter.

Later Years

In 1503 Leonardo returned to Florence. There he continued his scientific studies and worked on four great paintings, including the *Mona Lisa*. He spent some of his later years in Milan and Rome. In 1516 he moved to Cloux (now Clos-Lucé), France, to work for the French

In about 1490 Leonardo da Vinci drew plans for a flying machine.

king. He spent most of his time there editing his writings. Leonardo died in Cloux on May 2, 1519.

Leopard

The leopard is a wild cat of Africa and Asia. It is known for its spotted coat. Leopards are sometimes called panthers. The scientific name of the leopard is *Panthera pardus*.

An average leopard weighs between 110 and 200 pounds (50 to 90 kilograms). It is about 7 feet (2 meters) long, not including the long tail. Some leopards grow much larger.

Most leopards have yellow fur on the back and white fur underneath. Dark spots cover much of the body. The size and spacing of the spots are different in different types of leopard. The leopard

called the black panther has a black coat on which the spots barely show.

Leopards can live in a variety of habitats. They are found in forests, deserts, grasslands, mountains, and rocky places. They are skilled climbers and good swimmers.

Leopards live alone. They come together only to mate. The female gives birth to two to four babies, called cubs. The cubs go off on their own after about two years.

Leopards are fierce predators that hunt mainly at night. They hunt antelope, deer, dogs, and baboons. Leopards also eat cattle and may attack humans. Sometimes they drag their prey high into a tree to protect it from other animals.

In some places leopards are endangered, or at risk of dying out. Some people hunt leopards for sport and for fur. Other people have taken over the leopard's habitat.

Leopards were once known as pards. People today sometimes call them panthers.

Lesotho

The Kingdom of Lesotho is entirely surrounded by the country of South Africa. Lesotho's capital is Maseru.

Geography

Mountain ranges cover about two thirds of Lesotho. In the west is a flatter region. The Orange and Tugela rivers, two of southern Africa's largest waterways, have their sources in Lesotho's mountains. Lesotho has hot summers and cold winters.

Plants and Animals

Overgrazing and erosion have largely destroyed the natural grasslands of Lesotho. The country's other vegetation includes Cape willow trees, wild olive trees, and aloe plants. Lesotho's animals include small antelope, hares, and a few leopards.

People

Most of Lesotho's people belong to the Sotho ethnic group. A smaller number

The Sotho people of Lesotho traditionally live in small round houses.

of people are Zulu. Sotho and English are the two main languages. Nearly everyone is Christian. Most of the population lives in rural areas.

Economy

Lesotho sells water and electricity to South Africa. Its factories make food and clothing. Construction, diamond mining, and tourism are other important industries. Many of Lesotho's people work in South Africa or as farmers. Farmers raise sheep and goats and grow corn, potatoes, wheat, and beans.

History

For thousands of years Lesotho was the hunting ground of the San people, or Bushmen. In the 1800s the Sotho people took control of the region. In 1871 the British made the land a colony known as Basutoland. The Kingdom of Lesotho gained independence in 1966.

Lettuce

The center leaves of a head lettuce plant grow in a tight, round cluster.

Lettuce is the most widely planted salad vegetable. There is only one species, or type, of lettuce. Its scientific name is *Lactuca sativa*. It belongs to the same large plant group as daisies and dandelions.

Farmers in many parts of the world grow lettuce. It grows best in mild weather. High heat can keep lettuce from growing to its full size and can make the leaves taste bitter. Lettuce needs plenty of water, but too much water can cause it to lose its crispness.

Lettuce has shallow roots and large leaves. It grows in four different forms: head, leaf, romaine, and stem. The leaves of head lettuce are folded into a ball. Leaf lettuce has a cluster of curled leaves. Romaine lettuce has tall, smooth leaves. Stem lettuce has narrow leaves and a thick stem.

If lettuce is left to grow, it produces a long, slender stalk. Small yellow flowers

grow on this stalk. Farmers usually take lettuce from the field before it grows flowers. Lettuce must be eaten soon after being harvested.

Lettuce is a healthy food choice. It is almost 95 percent water, so it is low in calories and fat. It also contains fiber and some vitamins. Lettuce adds flavor and crunch to salads and sandwiches. People cook stem lettuce in stews and in many Asian dishes.

Levee and Dike

Like dams, levees and dikes have a simple but important job: they hold back water. People build levees to keep rivers or lakes from flooding low-lying land during storms. Dikes are often built

A levee divides rice paddies (wet growing areas) in Japan. The levee also holds the water away from nearby houses.

Did You Know?

In 2005 Hurricane Katrina damaged levees protecting New Orleans, Louisiana, which caused terrible flooding in the city.

to reclaim, or take back, land that would naturally be underwater. For example, dikes may be used to create a new area of dry land along a seacoast. Levees and dikes look alike. Sometimes the words levee and dike are used to mean the same thing.

Structure

Levees and dikes can be made of dirt, cement, or stacked stones. They are built along the edges of the body of water they hold back. They must be wide enough so that they will not collapse or wear away under pressure from the water. The tops of levees and dikes made of dirt are often planted with grass to help hold the dirt together.

History

Levees and dikes have been built for thousands of years. The ancient Egyptians built levees for more than 600 miles (966 kilometers) along the Nile River. People in ancient Mesopotamia and China also built levees. One of the largest modern systems of levees runs along the Mississippi River in the United States. These levees extend from southern Missouri to the Gulf of Mexico, a distance of about 1,000 miles (1,600 kilometers).

The most famous system of dikes is in The Netherlands. Much of the country's land was once underwater. Since the 1200s people have built dikes to reclaim land from the sea. First they built dikes out in the sea. Then they pumped out the water between the dikes and the natural shoreline. More than 2,500 square miles (6,500 square

kilometers) of The Netherlands is reclaimed land.

Lewis, C.S.

The British writer C.S. Lewis is famous for writing a series of books called *The Chronicles of Narnia*. Lewis wrote many other books, including poetry, science fiction, and books about Christianity.

Clive Staples Lewis was born on November 29, 1898, in Belfast, Ireland. As a child, he missed a lot of school due to illness. In 1916 he went to University College in Oxford, England. He left school for a time to fight in World War I with the British Army. After college, he became a teacher.

Lewis published many books throughout his teaching career. Some were about

C.S. Lewis

the subjects he taught. He also wrote about being a Christian. One of his most well-known Christian books is called *The Screwtape Letters*. It was published in 1942. It is a humorous story about devils trying to tempt a young Christian.

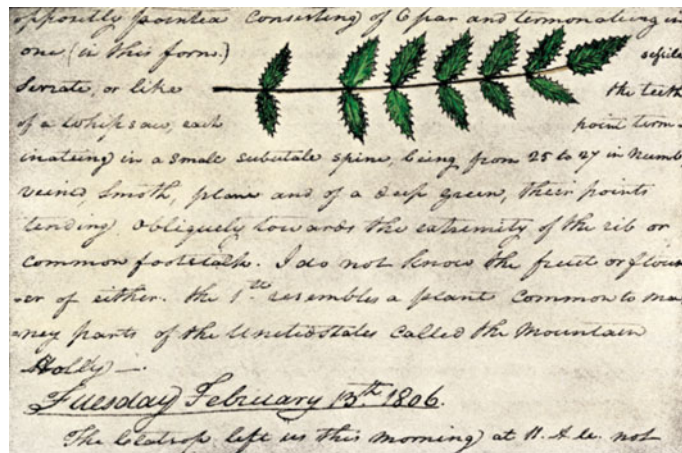

In 1950 Lewis wrote one of his most famous books. It was a children's book called *The Lion, the Witch, and the Wardrobe*. This book was the first of the series called *The Chronicles of Narnia*. The seven books tell the story of four brothers and sisters. They discover a magical world called Narnia, where they have many adventures.

C.S. Lewis died on November 22, 1963. He had retired from teaching the summer before.

Lewis and Clark Expedition

Between 1804 and 1806 a group of U.S. soldiers and explorers traveled from the Mississippi River to the Pacific coast and back. The leaders of this expedition, or journey, were Meriwether Lewis and William Clark.

In 1803 the United States had bought a huge territory west of the Mississippi River. It was called the Louisiana Territory. President Thomas Jefferson sent Captain Meriwether Lewis to find out what was there. Lewis chose Lieutenant William Clark to share the leadership.

Lewis and Clark kept journals during their expedition. In the journals they made sketches and took notes about everything that they observed during their journey.

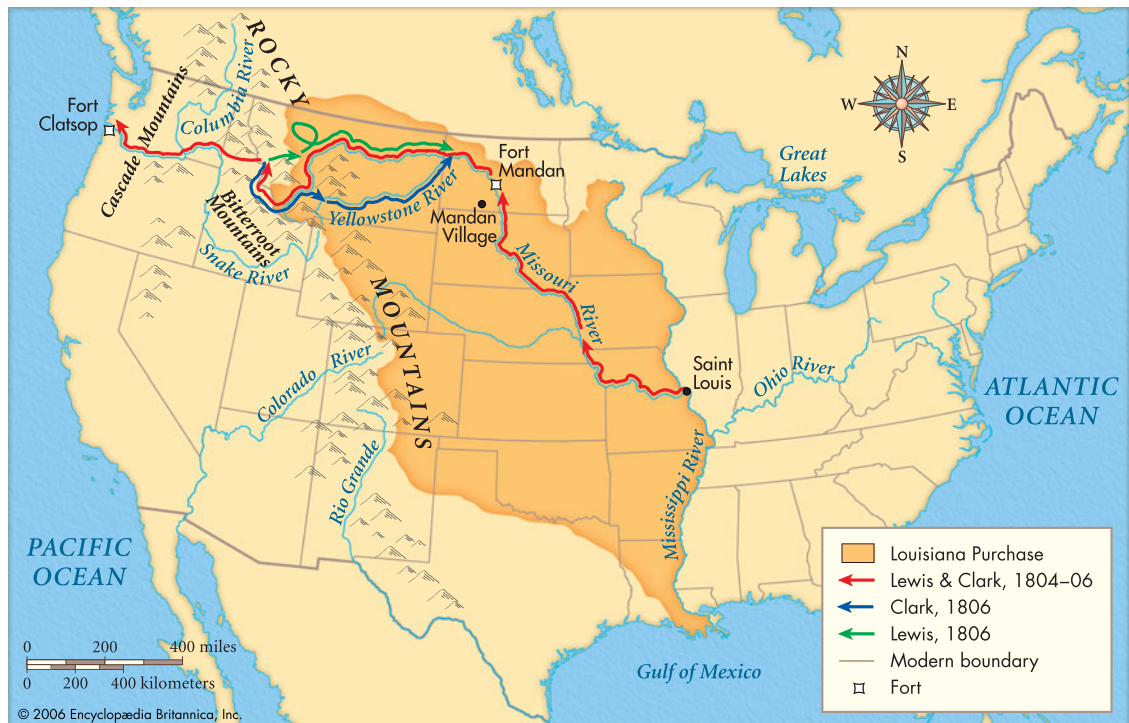

Lewis and Clark chose men who knew how to live in the wilderness to go with them.

Westward Bound

Home base for the group was near what is now Saint Louis, Missouri. On May 14, 1804, the men started up the Missouri River in three boats. On August 3 they had their first meeting with Native Americans, near what is now Council Bluffs, Iowa.

The group spent the winter in what is now North Dakota, among the Mandan Sioux. There a young Native American woman named Sacagawea joined the expedition. Sacagawea was very helpful to the explorers. She knew which plants were good to eat. She also knew Native American languages.

In the spring of 1805 the explorers continued up the Missouri to its source, in what is now southwestern Montana. They then followed another river, the

Jefferson, westward into the Rocky Mountains.

The group was now in the land of Sacagawea's people, the Shoshone. As a child Sacagawea had been kidnapped and taken away from her home. The explorers met her brother, who was a chief. He gave the explorers horses and a guide to help them cross the Bitterroot Range of the northern Rocky Mountains.

The group then left the horses behind and made the rest of the trip by river in canoes they built. They finally reached the Pacific Ocean on November 15, 1805. They had traveled more than 4,100 miles (6,600 kilometers). They built a stockade called Fort Clatsop a few miles from the coast, south of what is now Astoria, Oregon. They spent the rainy winter there.

Homeward Bound

The return trip began on March 23, 1806. The group crossed the Rocky Mountains in June. Clark then followed the Yellowstone River to the Missouri. Lewis went northeast to explore the Marias River. There the expedition had its only fight with Native Americans. Two members of the Blackfoot tribe were killed.

The party reunited downriver. The men left Sacagawea and her family at the Mandan villages. The explorers reached Saint Louis on September 23, 1806.

Lewis and Clark brought back diaries and maps. These provided much information about the land, plants, animals, and people of the western territory.

Liberia

The oldest republic in Africa is Liberia, whose name means “land of the free.” Freed U.S. slaves settled the country in the 1820s. The capital and largest city is Monrovia.

Liberia borders Sierra Leone, Guinea, and Côte d'Ivoire. The Atlantic Ocean lies to the southwest. Along the coast are low, sandy plains. Farther inland are hills and low mountains.

Tropical rain forest covers about one fifth of Liberia. The country's rich wild-life includes monkeys, chimpanzees, antelope, and rare pygmy hippopotamuses.

Liberia's many ethnic groups include the Kpelle, the Bassa, the Grebo, the Gio, the Kru, and the Mano peoples. People descended from U.S. slaves form a small group. The common language is English, but different groups have their own languages. Most people practice

Liberian president Ellen Johnson-Sirleaf gives a speech. In 2005 Johnson-Sirleaf was elected the first woman president in Africa.

traditional African religions, but there are many Christians and Muslims.

Liberia is a poor country. Most people grow rice, cassava, and vegetables and raise livestock for their families. Liberia also produces natural rubber, coffee, cocoa, and palm oil. Its natural resources include iron ore, diamonds, and timber.

African peoples lived in what is now Liberia when the first European explorers reached the coast in the 1400s. In the early 1800s the land was chosen as a home for freed U.S. slaves. Liberia became an independent republic in 1847.

In 1980 the military overthrew the government. In 1989 rebels began a brutal civil war. The war finally ended in 2003.

Liberty, Statue of

The Statue of Liberty stands on Liberty Island in New York Bay, in the United States.

Since 1886 the Statue of Liberty has stood in New York Bay as a symbol of the United States. The statue has welcomed millions of people to the country.

The Monument

The Statue of Liberty stands on Liberty Island, just off the southern tip of Manhattan Island, a part of New York City. The statue is about 151 feet (46 meters) tall. With its concrete base, it stands 305 feet (93 meters) high. The statue is made of thin sheets of pounded copper. A steel framework supports the copper.

The formal name of the statue is *Liberty Enlightening the World*. Liberty is shown in the form of a woman wearing a crown. The light comes from a torch she holds.

The base displays a poem by Emma Lazarus entitled *The New Colossus*. It reads:

Give me your tired, your poor,
Your huddled masses yearning to
breathe free,
The wretched refuse of your teeming
shore.
Send these, the homeless, tempest-
tost to me,
I lift my lamp beside the golden door!

History

The statue was a gift from the people of France. The French sculptor Frédéric-Auguste Bartholdi designed the statue. Workers in France completed it in 1884. The statue was then taken apart and shipped to the United States, where it was reassembled on its base. The base was designed in the United States.

The statue became a national monument in 1924. Workers fixed it up for its 100th birthday in 1986. They repaired the metal and applied new gold to the flame of the torch. A museum in the base of the statue is open to visitors.

Liberty Bell

In Philadelphia in 1776, the Liberty Bell rang to announce the independence of the United States from Great Britain. At that time, however, the bell was not called the Liberty Bell. People who wanted liberty, or freedom, for slaves gave the bell its name in 1839.

The Liberty Bell hangs in Liberty Bell Center in the U.S. city of Philadelphia, Pennsylvania.

The Liberty Bell is mostly copper and tin. It is 3 feet (91 centimeters) high and 12 feet (3.7 meters) around at the bottom. It weighs about 2,080 pounds (943 kilograms). A large crack runs down one side. On the bell is a verse from the Bible (Leviticus 25:10): “Proclaim liberty throughout all the land unto all the inhabitants thereof.”

The Pennsylvania Provincial Assembly (the colony’s group of lawmakers) ordered the bell from Britain in 1751. In June 1753 it was hung in the steeple of the assembly’s building. People rang the bell to announce meetings and public gatherings.

Officials rang the bell on July 8, 1776, to announce the first public reading of the Declaration of Independence. During the American Revolution, patriots hid the bell from British soldiers. The

British might have melted it down to make cannonballs.

After the war, the bell went back to the assembly building—which was renamed Independence Hall. The bell cracked in 1835. The crack got bigger in 1846. Since then, the bell has not rung. In 2003 the bell was moved to a new building, called Liberty Bell Center, near Independence Hall.

Library

A library is a collection of resources that provide information and entertainment. A library has books, newspapers, magazines, films, audio recordings, and computer software. Workers called librarians keep the resources in order and show people how to find and use them. Most

A boy in a library chooses several books to read.

libraries lend materials to people who have a library card.

Types of Libraries

Cities and counties run public libraries. A public library system may have many branches, or locations, in different neighborhoods. Public libraries offer a library card to anyone who lives in the area. Most public libraries have computers that people can use for free. Many public libraries also offer special services for children, such as story hours.

Most elementary and high schools have libraries. School libraries offer many of the same resources as public libraries. But they focus especially on meeting the needs of students and teachers. School librarians work closely with teachers to make sure that they have the most useful educational materials.

College and university libraries also serve teachers and students. But they usually are much larger than elementary and high school libraries. Sometimes they have millions of books. These libraries often have books in many languages. Sometimes they have rare and very old books, too.

Organizations such as hospitals, museums, churches, and companies might have their own libraries. Most are open to employees or members only.

Countries have libraries called national libraries. Most national libraries keep a copy of every book that is published in their country.

Using the Library

Most libraries have books on all kinds of subjects, from history to science to the arts. They have novels, plays, storybooks, and poetry books, too. The books are organized by subject and type. For example, all the books about music are in one area, and all the poetry books are in another area. Libraries often have a special section where all the children's books are kept.

Most of the books in a library can be checked out and taken home. But most libraries also have books that cannot be removed from the library. These books are in an area called the reference section. This section includes dictionaries, encyclopedias, atlases, and almanacs.

Librarians keep track of the library's collection by marking each item with a number called a call number. These numbers tell where items can be found on the shelves. Librarians give call numbers to items based on different systems for arranging them by subject or type.

A librarian explains to some students how to find the information they need.

Did You Know?

In the 600s BC the library of Nineveh, in Mesopotamia, held more than 25,000 clay tablets.

Many librarians use the Dewey Decimal System. In this system there are 10 main subjects. Each of these subjects is divided into 10 smaller sections. And those smaller sections are further divided into even smaller parts. Each number in the Dewey system has at least three digits to show these divisions. For example, geography and history books are numbered from 900 to 999. Books on the history of North America are numbered from 970 to 979. And books on the history of the United States are numbered 973. Some numbers also have a decimal point and more digits to divide the subject even further.

A library user can find an item's call number by looking in the library catalog. One kind of catalog is called a card catalog. A card catalog is a file of printed cards that list call numbers and other information about library items. A person can find a book by looking for the card filed under its author's name, its title, or its subject. Most libraries today have replaced their card catalogs with electronic catalogs. Library users can search an electronic catalog on computers in the library.

History

The first libraries were collections of official documents, or records. The most famous library in the ancient world was in Alexandria, Egypt. During the Middle Ages (AD 500 to 1500) monks in Europe copied books by hand. Libraries grew rapidly after printed books became available in the late 1400s. Today the

largest library in the world is the Library of Congress, in the United States.

Libreville

Population
(2003 estimate),
metropolitan
area, 661,600

Libreville is the capital of Gabon, a country in western Africa. It is Gabon's largest city. Libreville has a port on the Atlantic Ocean.

Many people in Libreville work for the government. The port is also important to the economy. Ships load up there with lumber and minerals. Shipbuilding also brings money to the city.

A people called the Pongoue settled in the Libreville area in about the 1500s. The Fang moved there in the 1800s. The French founded Libreville in 1849 as a settlement for freed slaves. The name Libreville means "free town." In 1960 Gabon became an independent country with Libreville as its capital. Oil was discovered off the coast near the city in the 1970s.

The Library of Congress was founded in 1800.

Libya

Libya is a country in North Africa. Large amounts of oil have brought wealth to the country. Tripoli is Libya's capital and largest city.

Geography

Libya borders Tunisia, Algeria, Niger, Chad, Sudan, and Egypt. The Mediterranean Sea lies to the north.

Libya is within the Sahara, the world's largest desert. Bare rock and sand make up almost all of the country's land. There are some oases, or small areas of green land, in the desert. Most of the people and farms are in the northwest, near the coast. Mountains rise in the northeast.

Most of Libya is hot and dry. Only the coast has a cool, rainy winter. Libya's riverbeds are dry most of the year. The country mines some underground water in the desert and pipes it to the coastal

Metal objects and other goods are for sale at a shop in Tripoli, Libya.

cities. This large project is called the Great Man-Made River.

Plants and Animals

There are few natural plants in Libya. The country's animals include desert rodents, hyenas, foxes, jackals, gazelles, and wildcats. Eagles, hawks, and vultures are common birds.

People

Most of Libya's people are Arabs. Berbers were once the main people. Today most Berbers have adopted Arab culture. There are small groups of other Africans, Italians, Greeks, and other peoples. Arabic is the main language. Most Libyans are Muslims who belong to the Sunnah branch of Islam.

Economy

Libya's economy is based on oil, which Libya sells to other countries. Libya also

has supplies of natural gas and iron ore. Many people work in services, including government work, health care, and banking. Factories produce chemicals, metals, food products, and cement.

Agriculture is a smaller part of the economy. Libya's crops include watermelons, potatoes, onions, olives, tomatoes, and dates. Farmers also raise sheep and goats.

History

Many different groups—including Africans, Greeks, and Phoenicians—ruled parts of Libya in ancient times. The ancient Romans made the region part of their empire in the 100s BC. In AD 642 Arab armies moved into the area. Many of the local Berber peoples converted to Islam. The Turkish Ottoman Empire conquered the region in the early 1500s.

The ancient Romans ruled Libya for hundreds of years. They built theaters and other structures in Libya more than 1,800 years ago.

In 1911 Italy invaded Libya. The Libyan people never accepted Italian rule. Italy lost control of Libya during World War II, which ended in 1945.

In 1951 Libya became an independent monarchy, or a state headed by a king. In 1969 a group of army officers overthrew the king. Colonel Muammar al-Qaddafi was their leader. Qaddafi became the ruler of Libya. In 1977 he changed the name of the country to the Socialist People's Libyan Arab Jamahir-*iya*. *Jamahiriya* means "brotherhood."

People found deposits of oil in Libya in the 1950s. The country sold its oil around the world. It used the profits to build housing, roads, and modern schools.

Qaddafi also used oil money to build a strong military. He kept troops in Chad (south of Libya) between 1977 and 1987. He also supported the Arab countries that considered Israel to be their enemy.

Qaddafi was accused of supporting many terrorist attacks. For years he protected two Libyan men who were suspected of planting a bomb on a U.S.-owned passenger plane. The bomb killed 270 people over Lockerbie, Scotland, in 1988. The men finally went on trial in 1999. One was found guilty. In 2003 the United Nations lifted a ban it had placed on trade with Libya.

Lichen

Orange lichen covers a boulder in a mountainous area.

Lichens are made up of two tiny living things: a fungus and an alga. The fungus and the alga benefit from living together. The alga produces food, and the fungus gathers water. In this way a lichen can survive harsh weather that would kill a fungus or an alga growing

alone. This type of relationship is called symbiosis.

Lichens grow in most parts of the world. There are about 15,000 different species, or types. Lichens can live where few plants can survive. They are found in deserts, near mountain peaks, and in the frozen Arctic. They grow on stones, tree trunks, dead wood, and on the ground.

Most lichens are barely 0.25 inch (6 millimeters) high, but some can spread out to cover several feet. Many lichens look like flat, crusty blotches. Some look leafy. Some hang down in strands. Others have stalks and resemble miniature forests. Lichens range in color from brown to bright orange or yellow.

Some kinds of lichen are eaten by reindeer and even by humans. Other kinds are used to make dyes, medicines, and other products.

A type of lichen called old-man's beard grows on a tree trunk in Scotland.

Liechtenstein

The country of Liechtenstein is one of the smallest in Europe. Liechtenstein is a principality, meaning that a prince is the ruler. Vaduz is the capital.

Geography

The Rhine River separates Liechtenstein from Switzerland to the west. Austria lies to the east. Near the Rhine are lowlands. Mountains cover the eastern part of the country.

Plants and Animals

Copper beeches, maples, elms, limes, sycamores, and ashes are common trees in Liechtenstein. Animal life includes deer, foxes, badgers, and weasels.

People

Most of the people of Liechtenstein are related to an old Germanic tribe called the Alemanni. There are smaller groups of Swiss, Austrians, and Germans. The main language is German. Most of the population is Roman Catholic.

The castle of the prince of Liechtenstein overlooks the town of Vaduz.

Economy

Banking, tourism, and other services are important to Liechtenstein's economy. Industry is also very important. Factories produce electronics, ceramics, lenses, machinery, and metals.

Agriculture is a small part of the economy. Farmers raise cattle for dairy products and meat. Crops include grains, potatoes, and grapes.

History

The Alemanni tribe came into the region in about AD 500. In 1719 the Holy Roman Empire combined two small states into the principality of Liechtenstein. The country became independent in 1866. Today the prince of Liechtenstein plays an active role in the government.

Light

People and other animals can see because there is light. Light is a form of energy. The sun is a very important source of light energy. Without the energy from the sun, there would be no plants or animals on Earth's surface.

Sources of Light

Besides the sun, other sources provide light. Burning objects give off light. So do some animals, such as fireflies and certain fish. Lightning and electric light-bulbs also produce light.

Properties of Light

Light exists in two very different forms at the same time. One form is tiny particles called photons. The other form is waves. The easiest way to think about light is as waves. Light waves travel through space at a speed of about 186,282 miles per second (299,792 kilometers per second).

Scientists use an idea called wavelength to describe light waves. Like waves moving across a pool of water, light waves

have peaks and valleys. The distance between two of these peaks is called a wavelength. Sunlight contains light waves with long, medium, and short wavelengths.

The color of light depends on its wavelength. Red light has the longest wavelength. Violet light has the shortest wavelength. Orange, yellow, green, blue, and indigo have wavelengths in between those of red and violet. When light waves of all the colors travel together, the light looks white.

Certain objects, such as triangular pieces of glass called prisms, can separate white light into the individual colors. When light travels through a prism, waves of different wavelengths bend by different amounts. The color of each wavelength then appears separately. This effect is called a spectrum. A rainbow is a type of spectrum. When raindrops make a rainbow, they are acting like prisms.

Light and Sight

People see an object either because it gives off light or because the object reflects, or bounces back, light. For example, people see the sun because it gives off its own light. But people see the moon only because it reflects light from the sun.

Most objects absorb some light and reflect some light. The reflected light is the color of the object. If an object does not reflect much light, the light passes through it. This type of object is called transparent, or see-through. By contrast,

Some small sea creatures called tunicates give off light naturally.

Most objects reflect, or bounce back, colored light. Mirrors reflect nearly all the light that hits them. Windows are see-through because they do not reflect much light.

mirrors reflect almost all the light that hits them.

Light and Life

Light is very important to life on Earth. Using the energy of sunlight, plants combine a gas in the air called carbon dioxide with water in the soil. Through this process, called photosynthesis, plants make their own food. People and other animals then use plants for food. As plants make food, they also give off a gas called oxygen. People and other animals need oxygen to stay alive. Sunlight helps animals to grow, too. It causes the body to make vitamin D, which the body needs to make bone.

Lighthouse

Ships rely on lighthouses to warn them of danger and to guide them to land or a harbor. A traditional lighthouse is a tall, rounded tower on land near a coast. Modern lighthouses may be on land or they may be a platform in the sea. The main feature of all lighthouses is a bright light.

Lighthouses used to be operated by a lighthouse keeper who lived in the building. Many modern lighthouses have automatic lights that are operated by remote control.

Types of Signals

The earliest lighthouses used burning fires as a source of light. Later versions used lanterns holding groups of large candles, or lamps that burned oil or gas. Today the standard source of light is an electric lamp. A special lens focuses the light into a beam that can be seen far away. The lamp and the lens turn so the beam shines in all directions.

The Thomas Point Lighthouse sits in Chesapeake Bay, south of Annapolis, Maryland. It was built in the 1800s.

In bad weather, light cannot always be seen. Lighthouses then must use other methods to signal ships. One method is sound. Lighthouses once used cannons or bells to warn ships. Today the most common sound device is the foghorn. Modern lighthouses also send out radio and radar signals to passing ships.

Lightships and Buoys

Lightships and buoys are movable devices. They are used in places where lighthouses cannot be built. Modern lightships are small ships equipped with lights, a foghorn, and radio devices. Buoys are smaller floating objects. They provide light to navigators as well as other information through their color and shape.

History

The first true lighthouse may have been one that was built in about 280 BC in Egypt. The Phoenicians, Greeks, and Romans also built lighthouses during ancient times. As shipping increased in Europe around AD 1100, construction of lighthouses also increased.

In 1759 an English engineer named John Smeaton designed a new type of lighthouse. It became a model for most lighthouses that followed. The lighthouse was built from interlocking blocks of stone instead of wood. This strengthened the structure so it could withstand powerful waves.

Lilongwe

Population
(2008 estimate)
669,020

Lilongwe is the capital of Malawi, a country in southeastern Africa. The country's president and lawmakers work in Lilongwe. Malawi's highest court meets in the city of Blantyre. Blantyre and Lilongwe are the two largest cities in Malawi.

The two centers of Lilongwe are called Old Town and Capital Hill. A nature sanctuary separates the two areas.

Farmers from surrounding areas sell their crops in Lilongwe. Malawi's main crop is tobacco. Large amounts of tobacco are traded in Lilongwe. Many people in the city work in government offices, schools, or hotels.

Great Britain took over what is now Malawi in the late 1800s. The British founded Lilongwe in 1902 as a government post. Malawi became an independent country in 1964. Lilongwe became the capital in 1975. It was chosen to be the new capital because it lies in the center of Malawi.

The U.S. state of Maine is famous for its lighthouses. More than 60 lighthouses stand on its rocky shores.

Lily

Lilies are plants that are prized for their beautiful and fragrant flowers. There are about 80 to 100 species, or kinds, of true lily. They belong to a much bigger plant group called the lily family, which contains about 4,000 species. The lily family includes tulips, hyacinths, and the onion.

True lilies grow wild in Asia, Europe, and North America. They are also very popular in gardens.

Most true lily plants are about 1 to 4 feet (30 to 120 centimeters) tall. They have narrow leaves and flowers that grow alone or in clusters. The flowers can be shaped like trumpets, funnels, tubes, or bowls. They can be any of a variety of colors. The largest flowers can be 10 inches (25 centimeters) wide. One plant can produce many flowers.

Many plants that are called lilies are not true lilies. Daylilies and the lily of the valley are not true lilies, but they

belong to the lily family. Daylilies have yellow to red flowers that last for just one day. The lily of the valley has small white flowers that droop down from a stalk. Water lilies are not part of the lily family.

Lima

Population
(2007
estimate), urban
area,
8,472,930

Lima is the capital of the South American country of Peru. It is the largest city in Peru by far. It is also Peru's center of culture, business, and manufacturing.

One of Lima's nicknames is The Octopus. This is because the greater city area spreads out very far, like the arms of an octopus. Within this area is Callao, a port on the Pacific Ocean. It is Peru's busiest port. The historic center of Lima features the Presidential Palace and a Roman Catholic cathedral.

Lima is the most important economic center in Peru. It has Peru's largest number of government and business offices, banks, and industries. Factories in Lima process oil and make electronics, medi-

Lilies come in many colors, including pink.

Miraflores is a popular and busy area of Lima, Peru.

cines, food products, plastics, clothes, and other goods.

People have lived in the Lima area for thousands of years. Some 1,500 years ago it was a center of worship for a local god named Pachacamac. The Inca took over the area in the 1400s.

The Spanish conqueror Francisco Pizarro founded Lima in 1535. Nearby Callao soon became Spain's main port in the region. For about 200 years Lima was the capital of nearly all of Spain's colonies in South America.

A powerful earthquake nearly destroyed Lima in 1746. The city was later rebuilt.

In 1821 Peru became an independent country with Lima as its capital. Lima grew greatly in the 1900s.

Lime

The lime is a tart, green fruit that grows on a tree. It is the smallest member of the citrus family. Other citrus fruits include lemons, oranges, and grapefruit. The lime's scientific name is *Citrus aurantifolia*.

Lime trees grow in many warm regions, including Southeast Asia, the West Indies, the region around the Mediterranean Sea, South America, and Central America. Brazil produces most of the world's limes. Mexico and the United States also grow limes.

Lime trees are short and shrublike. They have small leaves and sharp thorns. The fruits develop from white, sweet-smelling flowers. Most lime fruits are round or oval in shape. They are about 1.5 inches (4 centimeters) across. They have a thin, green skin, or rind, that lightens to almost yellow as the fruit ripens. The pulp inside is pale green and juicy.

Limes are a yellowish green color when ripe.

Limes have a sour taste because their juice contains a lot of acid. Even so, limes are a popular ingredient in many kinds of drinks, sweet desserts, and other foods. Limes are also a good source of vitamin C.

Limestone

Limestone is a type of rock that is made up of bits of animal shells. Over millions of years these shells collected on the ocean floor. As layers of shells and mud built up, the lower layers slowly hardened into limestone.

Limestone is found all over the world. Dover, England, is famous for its white cliffs made of chalk, a soft form of limestone. Not all limestone is soft, however. Marble is a type of hard limestone that was formed by great pressure and heat in Earth's crust.

Machines cut blocks of limestone from large holes in the ground called quarries.

Large deposits of limestone often contain caves. Water flowing underground carves out these caves. The water dissolves, or breaks down, limestone more easily than other types of rock.

Limestone is used to make cement, roads, and fertilizer. In addition, many forms of limestone are strong enough to be used as building materials. People use limestone for making floors, for covering the walls of buildings, and for making monuments. Limestone is useful for building because it does not easily wear away and it is not difficult to shape. Over time, limestone buildings and monuments turn from white to gray.

Many limestone deposits contain fossils, or imprints of ancient plants and animals. Scientists who study Earth have learned about the planet's development from the fossils found in limestone.

Nebraska

Lincoln, Abraham

Historians see Abraham Lincoln, the 16th president of the United States, as one of the country's greatest leaders. During the American Civil War Lincoln promised to save the Union. Known as the Great Emancipator, he also ended slavery in the United States.

Early Life

Abraham Lincoln was born in a log cabin near Hodgenville, Kentucky, on February 12, 1809. His parents, Thomas and Nancy Hanks Lincoln, were pioneer farmers. In 1816 the family moved to Indiana. After Abe's mother died, his father married Sarah Bush Johnston. In all, Abe went to school for less than a year.

In 1830 Lincoln moved to New Salem, Illinois. He tried several jobs and began to study law books. After becoming a lawyer in 1836, he moved to Springfield, Illinois. In 1842 Lincoln married Mary Todd. They had four sons.

Abraham Lincoln was the 16th president of the United States.

Political Career

In 1834 Lincoln was elected to the Illinois legislature. He was reelected three times. In 1847 he entered the U.S. House of Representatives. In 1849 he returned to his law practice.

The issue of slavery brought Lincoln back to politics. In 1856 Lincoln helped to organize the Illinois branch of the new Republican Party. Republicans wanted to stop the spread of slavery. In 1858 Lincoln challenged the Democrat Stephen A. Douglas for a seat in the U.S. Senate. The two candidates took part in several debates on slavery. Douglas won the election, but the debates made Lincoln famous.

Presidency and Civil War

Lincoln ran for president in 1860 and won. The Southern states feared that a Republican president would abolish slavery. They decided to secede from, or leave, the Union. South Carolina seceded in December 1860. By the time Lincoln took office in March 1861 six more Southern states had seceded. The Southern states organized a separate government, the Confederate States of America. The Civil War began in April 1861, when Confederate troops fired on

TIMELINE

November 19, 1863

The Civil War ends.

April 9, 1865

Lincoln is shot; he dies the next morning.

April 14, 1865

Fort Sumter, a Union fort in South Carolina.

Lincoln's main goal in the war was to save the Union. However, he knew he had to settle the slavery question in order for the United States to survive. In 1862 Lincoln promised freedom for slaves in any Confederate state that did not return to the Union that year. When the South paid no attention, Lincoln freed those slaves with the Emancipation Proclamation on January 1, 1863.

In November 1863 Lincoln delivered a speech—called the Gettysburg Address—at a battlefield in Gettysburg, Pennsylvania. He promised to save the United States's "government of the people, by the people, for the people."

End of the War and Assassination

In 1864 Lincoln was elected to a second term as president. On April 9, 1865, General Robert E. Lee surrendered his Confederate army to Union leader General Ulysses S. Grant. To celebrate the end of the war, Lincoln went to Ford's Theatre in Washington, D.C., on the night of April 14. During the play John Wilkes Booth, a young actor and slavery supporter, shot Lincoln in the head. Lincoln died the next morning. Vice President Andrew Johnson became president.

Lincoln-Douglas Debates

In the 1858 election for U.S. senator from the state of Illinois, the candidates were Abraham Lincoln and Stephen A. Douglas. They met seven times to debate, or discuss, important topics. The main topic was whether slavery should be allowed in new states forming to the West.

Douglas was the Democratic Party candidate. He was running for reelection. He had sponsored the Kansas-Nebraska Act of 1854. This law made slavery possible in places where it had been banned since 1820.

Lincoln was the Republican Party candidate. At the time, few people outside

An illustration shows Abraham Lincoln and Stephen A. Douglas debating in front of a crowd in 1858.

Did You Know?

Abraham Lincoln is buried in Oak Ridge Cemetery in Springfield, Illinois.

Illinois knew anything about him. His party had been formed to stop slavery from spreading.

When Lincoln was nominated he said that slavery would be a major problem for the country because the country was so divided over the issue. In the debates Douglas tried to make Lincoln seem like a dangerous person who wanted the United States to break apart. Lincoln made the point that slavery was wrong and that it had led to much violence.

Douglas won the election, but Lincoln won many followers. Two years later the two men ran against each other again. This time it was for president of the United States. By then the Democratic Party was badly split because of the slavery issue. Also, the debates had made Lincoln a respected person throughout the North. These two things enabled Lincoln to win the presidential election by a good margin.

Lindbergh, Charles

Charles Lindbergh was the first person to fly an airplane alone across the Atlantic Ocean without stopping. People called him Lucky Lindy.

Charles Augustus Lindbergh was born on February 4, 1902, in the U.S. city of Detroit, Michigan. He studied flying in

Charles Lindbergh stands in front of his airplane, the *Spirit of Saint Louis*, in 1927.

Nebraska and Texas. At that time airplanes were still a new invention. In 1926 he began flying mail between Saint Louis, Missouri, and Chicago, Illinois.

In 1927 Lindbergh decided to compete for a prize for flying nonstop from New York City to Paris, France. He had a plane, called the *Spirit of Saint Louis*, built for him. On May 20 and 21, 1927, Lindbergh made the flight in 33 hours and 30 minutes. He became an instant hero in the United States and Europe.

In 1929 Lindbergh married the writer Anne Morrow. Later she was his copilot and navigator on flights around the world. In 1932 their child was kidnapped and murdered. The crime received worldwide attention.

In the early 1940s Lindbergh gave speeches calling for the United States to stay out of World War II. But once the United States entered the war, Lindbergh helped the war effort. He flew 50 combat missions in the Pacific war zone.

After the war Lindbergh and his family lived quietly in Connecticut and later in Hawaii. Lindbergh died in Hawaii on August 26, 1974.

Lion

The lion is the second largest member of the cat family after the tiger. Lions live in parts of Africa and India. Their loud roar is among the most terrifying sounds of the grasslands. The scientific name of the lion is *Panthera leo*.

Physical Features

The lion has a long body, short legs, sharp claws, and a large head. Adult males are about 9 to 10 feet (2.7 to 3 meters) long, including the tail. They stand about 3 feet (1 meter) tall at the shoulder and can weigh 370 to 500 pounds (170 to 230 kilograms). Females are shorter and more slender.

Lions are covered with yellow-brown hair. A male lion is easy to spot because

A lioness is very protective of her cubs.

of its mane. This coarse hair grows on its head, neck, and shoulders. Lionesses (females) do not have manes.

Behavior

Lions live in groups called prides. A pride is made up of related lionesses, their cubs, and one or two adult males. Prides average 15 members.

Lionesses usually do most of the pride's hunting, mainly at night. They hunt animals such as zebras, wildebeests, and antelopes. They often hunt by hiding beside a water hole and then pouncing. Sometimes prides hunt together as a team and share the kill.

Life Cycle

Three months after mating, lionesses bear one to six cubs. The newborns have spots or stripes that disappear within nine months. The mother guards her cubs closely. She teaches them to hunt when they are about 18 months old.

Lions in the wild rarely live more than 8 to 10 years. Lions in zoos have a life span of about 25 years.

Lions and Humans

Since the days of the Roman Empire, people have caged lions for display in circuses and zoos. People also have hunted the lion for many years. Today lions are protected in some national parks.

Lisbon

Population
(2001 census),
city, 564,657;
(2005 estimate),
metropolitan
area,
2,761,000

Lisbon is the capital of Portugal, a country of southwestern Europe. The city lies on the Tagus River near where it flows into the Atlantic Ocean. Lisbon grew wealthy from sea trade in the 1400s and 1500s. It was then the center of Portugal's large and powerful empire. Today Lisbon is still Portugal's main port and largest city. It is also a center of business and industry.

Lisbon is a city of white houses and elegant parks and gardens. The city's main street, the Avenida da Liberdade (Liberty Avenue), has wide, mosaic-covered sidewalks.

Tourism, banking, insurance, and other service industries are important to Lisbon's economy. The greater Lisbon area is also a major manufacturing center. The area's traditional industries include the making of soap and steel. Today factories there also make such goods as cement, electronics, cars, foods, and paper products.

A people called the Phoenicians probably founded Lisbon as a trading station in about 1200 BC. The city was later

ruled by the Roman Empire and then Germanic peoples.

Muslims from North Africa took control of the area in the 700s. In 1147 the Christian king of Portugal conquered the city. Lisbon became the capital of Portugal in 1256.

In the 1400s and 1500s Portugal's explorers and conquerors created a huge overseas empire. Lisbon became the trade center for the Portuguese empire. Many of Lisbon's residents became rich.

One of the greatest earthquakes ever recorded struck Lisbon in 1755. It caused a huge ocean wave, called a tsunami, to wash ashore. Much of Lisbon was destroyed.

Dom Pedro IV Square, also called Rossio Square, is a center of activity in Lisbon, the capital of Portugal.

Lisbon was rebuilt quickly. The city grew larger in the 1800s and 1900s. Lisbon hosted a large fair called the World Exposition in 1998.

Literature

Literature, both fiction and nonfiction, has the power to take readers to another place and time.

Literature is writing that is usually considered to be a work of art. It is different than written works such as cookbooks, travel guides, or how-to books. Those are meant only to provide information. In general, literature communicates ideas of lasting interest, especially ideas about what it means to be human. A writer of literature takes special care in choosing and arranging the words. Some common types of literature include novels, poetry, and dramas.

Forms of Literature

Literature can be broadly divided into two categories—poetry and prose. Poetry, or verse, is written in lines. These lines are carefully arranged according to patterns of sound, rhythm, and meaning. A poem may or may not rhyme, or

use words with similar end sounds (such as “snake” and “rake”).

Prose uses language much like everyday speech. Novels, short stories, and most modern dramas are prose.

There are two main types of prose: fiction and nonfiction. Fiction, such as novels or short stories, is mostly made up. Nonfiction discusses facts or ideas about real events and people. Histories, speeches, letters, and reviews of art are just a few examples of nonfiction. Modern literature often focuses on fiction and poetry. But many works of nonfiction have also been considered great works of literature.

Literature is also written for different audiences. Some is written specifically for children while other works are more for adults.

How Literature Developed

The Oral Tradition

Thousands of years ago people used writing mostly to keep records. They expressed ideas about the world and their history by telling stories aloud, not writing them down. Literature that is spoken out loud is called oral literature.

Each generation of people told their stories to the next generation. In this way the stories were passed along. People usually told the stories in lines of poetry. The patterns and rhymes of poems made them easier to remember. Still, people could change the stories over time or forget them. Eventually people

began writing down the stories so they could not be changed or lost.

Written Literature

Cultures all over the world have developed rich written literatures. A short history like this can point out only a few examples.

Many ancient works of literature were epics, or long poems about the adventures of heroes. For example, the *Epic of Gilgamesh* was written at least 3,500 years ago in a part of the Middle East called Mesopotamia. Other early epics include the *Mahabharata* from India and the *Iliad* and the *Odyssey* from ancient Greece. The ancient Greeks also wrote many dramas and nonfiction.

In the Middle East and Asia storytellers told the tales of the *Arabian Nights*, or

Two actors play out a scene in a production of William Shakespeare's *Romeo and Juliet* staged in London, England.

The Thousand and One Nights. These tales were collected and written down in the 800s or 900s.

In the 1000s a Japanese woman named Murasaki Shikibu wrote *The Tale of Genji*. Many consider this story of a Japanese prince to be the world's oldest novel.

One of the first works of English literature was the epic *Beowulf*, about a hero who kills a monster. It was probably created in the 700s. The English poet Geoffrey Chaucer wrote *The Canterbury Tales* in the 1300s. This long poem tells stories about a group of travelers. In the 1400s Sir Thomas Malory retold legends of King Arthur in *Le Morte Darthur* (The Death of Arthur). The English writer William Shakespeare wrote many plays in the late 1500s and early 1600s.

A copy of Geoffrey Chaucer's *Canterbury Tales* from the 1400s includes an illustration of the characters in the poem.

Did You Know?

A novel is usually a long literary work that tells a story about realistic characters and events.

They are still considered to be some of the best literature ever written.

Don Quixote is often called the first modern novel. The Spanish writer Miguel de Cervantes completed it in 1615. Over the following centuries the novel became one of the most popular types of literature.

In the 1900s writers began to experiment with the form of the novel. The Irish writer James Joyce used a technique called stream of consciousness. In this form the author tries to present the thoughts of the characters as they occur to the character. Later in the century writers from Colombia, Argentina, and other Latin American countries wrote stories that were a mixture of real and fantastic events. This style became known as magic realism.

The 1800s and 1900s also saw changes in poetry. Until that time poems had taken many forms, but often they followed strict rules about rhyme and meter. In the 1800s poets began writing in a style known as free verse. This allowed them to write poetry that more closely resembled regular spoken language.

The Spread of Literature

At first all stories had to be copied by hand. This took a long time and was expensive. Only the wealthy and well-educated had access to these copies. In the 1400s Johannes Gutenberg invented a machine called a printing press. With the printing press many copies of a book could be made very quickly and

easily. Books became easier to get. Gutenberg paved the way for the ordinary person to borrow, own, and read books. Today bookstores and libraries make all kinds of printed literature available to the public.

Literature can also be enjoyed by watching a story performed on stage. Through radio, movies, and television, stories can now be presented to millions of people at one time.

Literature for Children

Books written especially for children are called children's literature. Children's literature includes stories, fairy tales,

Each year the American Library Association gives the Newbery Medal to the author of the best children's book. It gives the Caldecott Medal to the illustrator of the best picture book.

fables, poems, and novels. It also includes nonfiction (factual) works on history, science, and other subjects.

Children's literature can come in the form of picture books or chapter books. Picture books usually have a smaller amount of text, or words, and pictures on every page. They are written for younger readers. Chapter books have few or no pictures and much more text, which is divided into sections called chapters. Chapter books are written for older children.

Awards

Many countries give good children's books special attention through awards and prizes. In the United States the two most important prizes for children's literature are the Newbery Medal and the Caldecott Medal. The Newbery Medal goes to the author of the best children's book of the year. The illustrator of the year's best picture book receives the Caldecott Medal. The best-known international award is the Hans Christian Andersen Award. Another important international award is the Astrid Lindgren Memorial Award.

History

Until a few hundred years ago, few books were written for children. Many children did not even learn to read at all. The first literature especially for children was published in Europe in the 1600s. Most of this early writing was not meant to entertain children. Its purpose was to teach children lessons.

An illustration from the first edition of *The Wonderful Wizard of Oz* shows the book's main characters.

1700s

Many of the books read by children during the 1700s were books written for adults. These were adventure stories with interesting characters. For example, Daniel Defoe's *Robinson Crusoe* (1719) tells the story of a man who is shipwrecked on a deserted island. Another such book was Jonathan Swift's *Gulliver's Travels* (1726). It is about the adventures of a traveler in strange lands.

John Newbery in London, England, published the first edition of the well-known Mother Goose rhymes in the 1760s. A version of Newbery's book was first published in the United States in about 1785. Since then, generations of children have learned the traditional rhymes, such as "Little Miss Muffett."

Did You Know?

The poem *Twinkle, Twinkle, Little Star* first appeared in the 1804 book *Original Poems for Infant Minds* by Ann and Jane Taylor.

Most young children enjoy being read to. Listening to other people read aloud is an important part of learning to read.

1800s

By the 1800s, children's books were becoming an important kind of literature. Authors began making their stories more interesting and imaginative. Some children's books from the 1800s are still very popular today. Many children still enjoy Lewis Carroll's *Alice's Adventures in Wonderland*, which was published in England in 1865.

Many children's books from the 1800s were collections of fairy tales and folktales. These stories of magical creatures, animals that talk, and imaginary places have always fascinated children. Two German brothers, Wilhelm and Jacob Grimm, published a collection of old German fairy tales in 1812. The collection is commonly called *Grimm's Fairy Tales*. It features stories about such characters as Snow White and Cinderella. In the late 1800s Sazanami Iwaya of Japan wrote *Japanese Fairy Tales*, a collection of old stories. In 1896 K. Langloh Parker retold the folktales of the Aborigines (the native people of Australia) in *Aus-*

tralian Legendary Tales. A collection of Latin American folktales appeared at about the same time in Brazil. It was called *Contos da Carochinha*.

1900s and Today

During the 1900s more children's books were published than ever before. Many were collections of folktales from various countries.

In Great Britain and the United States much children's literature of this time focused on fantastic worlds. *The Wonderful Wizard of Oz* (1900) by L. Frank Baum, *Winnie-the-Pooh* (1926) by A.A. Milne, and *Charlotte's Web* (1952) by E.B. White are good examples. The playful poetry, funny characters, and fanciful drawings of the many books by Dr. Seuss also fit in this category. He published *The Cat in the Hat* in 1957.

Other children's literature of the 1900s showed realistic characters facing the difficulties of growing up. Lucy Maud Montgomery's *Anne of Green Gables* (1908), Katherine Paterson's *Bridge to Terabithia* (1977), and the novels of Judy Blume are examples. J.K. Rowling's popular Harry Potter books of the late 20th and early 21st centuries have a magical setting. However, they also realistically show the emotions of young people.

Lithuania

Lithuania is one of three countries in northeastern Europe known as the Baltic states. Latvia and Estonia are the other two. Lithuania's capital is Vilnius.

The Baltic Sea forms Lithuania's western border. Lithuania shares land borders with Latvia, Belarus, Poland, and Russia.

Lithuania's landscape includes low-lying plains and some hills. The country has a cool climate.

Lithuania has forests of pine, oak, birch, and spruce trees. Its wildlife includes wolves, foxes, otters, badgers, wild boars, elk, deer, beavers, and mink.

Most of the country's people are Lithuanians. The population also includes Russians, Poles, Belarusians, Ukrainians, and other groups. Most Lithuanians are Roman Catholics. More than half of the people live in cities.

© 2006 Encyclopædia Britannica, Inc.

Trakai Castle stands on an island in a lake west of Vilnius, Lithuania.

Services and manufacturing are the main parts of Lithuania's economy. Services include education, health care, and communications. Factories make tools, motors, electronics, petroleum (oil) products, cloth, chemicals, and ships.

In 1386 Lithuania's leader, called a grand duke, married the queen of Poland. The union of Lithuania and Poland lasted until the late 1700s. Russia then took over most of Lithuania.

Lithuania declared its independence in 1918. However, the Soviet Union took over in 1940. Nazi Germany seized control of Lithuania in 1941, during World War II. The Soviets drove out the Germans in 1944.

Lithuania gained independence when the Soviet Union collapsed in 1991.

Little Rock

Population
(2000 census)
183,133;
(2007 estimate)
187,452

Little Rock is the capital of the U.S. state of Arkansas. It lies on the Arkansas River.

Many people in Little Rock work for the state government. The city is a center of manufacturing. In addition, farmers in the region around Little Rock sell their crops in the city.

Little Rock began in 1722 when a French explorer set up a trading post. The post was at the site of a Quapaw Indian settlement. Little Rock soon grew up there. It became the capital of the Arkansas Territory in 1821. In 1836 Arkansas became a U.S. state with Little Rock as its capital.

The William J. Clinton Presidential Library is in Little Rock, Arkansas.

A major event in the civil rights movement happened in Little Rock in 1957. Since 1954 U.S. public schools were no longer allowed to have separate schools for people of different races. Nine African Americans tried to attend a school in Little Rock that had only white students. For several days Arkansas state troops would not let them enter the school. Eventually, U.S. troops made sure the African Americans could attend the school.

Liver

The liver is a spongy organ, or body part, in all vertebrates, or animals with a backbone. The liver does many important jobs. It cleans the blood. It also creates and stores substances that the body needs.

Structure

In humans the liver is the body's largest and heaviest organ. It lies mostly under the bottom five ribs on the right side of the body. It is made up of two rounded parts, or lobes. The right lobe is much larger than the left lobe.

Jobs of the Liver

Blood brings many substances to the liver for processing. The liver takes poisons and other harmful substances from the blood. It then breaks them down into safer forms. It breaks down worn-out red blood cells, too.

The liver is a large organ, or body part, located next to the stomach.

The liver also takes useful substances from the blood and stores them. These substances include sugars, vitamins, minerals such as iron, and amino acids. (Amino acids are the building blocks of proteins, which make up the body's cells.) The liver releases these stored materials when the body needs them.

In addition, the liver makes substances needed by the body. The liver makes proteins that help to clot blood. It makes certain enzymes, which break down food into fuel for the body. It also makes a yellow-green fluid called bile. Bile flows through ducts, or tubes, from the liver into a sac called the gallbladder. From the gallbladder, bile flows into the small intestine. There it helps to digest fats.

Liver Problems

Several different viruses and drugs can cause a liver disease called hepatitis. Drinking too much alcohol can scar the liver. This condition is called cirrhosis. These and other problems with the liver can cause jaundice, which is a yellowing of the skin and eyeballs. The yellow

color comes from a buildup of bile substances in the blood. Doctors can sometimes transplant a new liver into a patient whose liver has failed.

Living Thing

Animals, plants, fungi, algae, protozoans, and bacteria are living things. Living things are also called organisms. Scientists can tell living things and nonliving things apart because living things behave in ways that nonliving things do not. Scientists have discovered about 1.5 million different kinds of living things on Earth.

Scientists think that there are more than 14 million different species, or kinds, of living things on Earth. However, only about 1.5 million have been discovered. Most of these species are animals.

What Living Things Do

The most obvious clue to whether something is living is its ability to move. All living things can move, using their own energy. Even though plants stay in one spot, they move their leaves to get sunlight.

Living things are also sensitive. This means that they are able to feel. The simplest life forms can feel only when something touches them, or they have only a sense of hot and cold.

Living things take in certain chemicals and release other chemicals. Humans and other animals breathe in oxygen and breathe out carbon dioxide. Green plants

take in carbon dioxide through their leaves and release oxygen into the air.

All living things need the nutrients and energy that food gives. Green plants make their own food with the help of sunlight. Animals eat plants and other animals to get energy.

Living things reproduce. This means that they create a new generation of life. People and animals have babies. Plants make seeds or spores that grow into new plants. Even the most basic life form, a single cell, reproduces. It does so by dividing into two new cells.

Living things grow. When many cells in a plant or an animal divide, the plant or

Scientists divide living things into five main groups: protists, monerans, fungi, plants, and animals. These groups are called kingdoms.

animal becomes larger. Living things also grow by making new parts—for example, branches or teeth.

Finally, living things get rid of waste. When an animal or plant takes in nutrients, there is always a part that is not needed. This part is excreted, or released from the system.

Groups of Living Things

Scientists divide living things into groups. This process is called classification. The most basic groups are called kingdoms. There are five kingdoms of living things.

The first kingdom is called Monera. Monerans are single-celled organisms. They are too simple to be called plants or animals. They are so small that it takes the power of a microscope to see them. Bacteria, or germs, are monerans.

The second kingdom is called Protista. Most of these organisms are also single cells. Algae and protozoans are in this kingdom.

The third kingdom is Fungi. Most fungi have many cells arranged in threadlike groups. Mushrooms are fungi, and so are yeasts and molds.

The fourth kingdom is Plantae. Plants are also made of many cells. Most plants are green or have parts that are green.

The fifth and largest kingdom is Animalia. Like fungi and plants, animals have many cells. Unlike other living things,

animals move around easily and quickly react to their surroundings.

Lizard

Lizards belong to the group of animals called reptiles. Reptiles have scales on their body instead of hair or feathers. There are more than 3,000 species, or types, of lizard. Iguanas, chameleons, geckos, and skinks are some of the types.

Where Lizards Live

Lizards are cold-blooded animals. This means that the temperature of the body changes based on the temperature of the surroundings. Therefore most lizards do not live in very cold places. Many species are found in wet tropics or dry deserts. Lizards live underground, on the ground, and in trees or plants. A few species spend some time in water.

The Komodo dragon is the largest lizard.

The Australian frilled lizard spreads out the skin around its neck to scare enemies.

Physical Features

Lizards vary more in size and shape than any other group of reptiles. Some lizards are only an inch or two long. But the largest lizard, the Komodo dragon, can reach a length of 10 feet (3 meters). Most lizards have four strong legs, but some have no legs at all. These lizards look like snakes and are often mistaken for them. Unlike snakes, however, lizards have eyelids and ear openings. Lizards usually have a long tail, too.

Most lizards have dry scales covering their body. The scales are small plates that are either smooth or bumpy. They are often brown, green, or gray.

Many lizards have unique features. Some have horns or spines. Others have a bony plate around the neck. These features help the lizards scare away enemies. A few species have extra skin on the sides of the body. Spreading this skin helps them to glide from tree to tree.

Two kinds of lizard are poisonous. They are the Gila monster of the southwestern

United States and the beaded lizard of Mexico. Their venom, or poison, is strong enough to kill a human.

Behavior

Most lizards are active during the day. Geckos, however, are usually active from dusk to dawn. Different types of lizard have different ways of moving around. Most run on four legs, but some run fastest on their back legs. Legless lizards move like snakes do.

Many lizards are able to change from their drab color to a brighter color. They do this when trying to attract a mate or to scare away another animal. Some also change color as a way to communicate with each other. Temperature and light also affect lizards' color changes.

Lizards spend much of their time looking for food. Most lizards eat insects, but some eat seeds and plants. Lizards may dig for food. They also may wait for prey to come near. Then they dart suddenly to catch it.

The Gila monster has a strong bite. Its jaw delivers venom, or poison, into its victim.

Most lizards run away from their enemies. But sometimes an enemy cannot be avoided. In these cases some lizards puff themselves up with air and stand straight. This makes the lizard look bigger and tougher.

Many lizards use their tails to escape from enemies. The tail breaks off when touched and then twists and wiggles on the ground. The wiggling tail distracts the enemy while the lizard escapes. A lizard usually can grow a new tail.

Reproduction

Most lizards reproduce by laying eggs. The females of most species lay several eggs at a time, but some kinds lay only one or two. The eggs have tough, leathery shells. Lizards usually bury their eggs or hide them under leaves. In a few species the females watch their eggs until they hatch. Most lizards, however, leave the eggs after laying them. A few types of lizard give birth to live young instead of laying eggs.

Lizards and Humans

In some parts of the world people eat large lizards, such as iguanas. Many small lizards are useful to people because they eat insect pests.

Human activities have threatened the survival of some lizard species. By cutting down trees to make room for buildings, people have destroyed the homes of some lizards. Capturing and selling lizards as pets also has reduced their numbers. The great Komodo dragon of

Indonesia, for example, was almost wiped out. It is now protected by law.

Llama

The llama is a mammal that belongs to the camel family. Unlike camels, llamas do not have humps. But like most camels, llamas are domesticated, or tamed to help people. Other close relatives of the llama are the alpaca, the guanaco, and the vicuña. The llama's scientific name is *Lama glama*.

Most llamas are found in South America. American Indians in Bolivia, Peru, Ecuador, Chile, and Argentina raise herds of the animals.

The llama has a long neck and a small head. It has a short tail and long legs that end in hooves. It is about 4 feet

Llamas are usually gentle animals, but when they get mad they may spit.

(1.2 meters) tall at the shoulder. Its hairy coat may be white, black, brown, or a mixture of these colors.

The llama eats many types of grass and other plants. It is a hardy animal that can survive for a long time without water. For these reasons, people often use llamas to carry loads in the Andes Mountains. People also use llama hair to make clothing, rugs, and rope.

Locust

Locusts are a type of grasshopper. They are found worldwide. They sometimes gather and fly together in huge groups called swarms.

Did You Know?

A 250-pound (113-kilogram) llama can carry a load of 100 to 130 pounds (45 to 60 kilograms).

Swarms, or large groups, of locusts can fly for thousands of miles.

Locusts are about 2 inches (5 centimeters) long. They have short antennae. Their strong, long hind legs make them good jumpers. Locusts make noise by rubbing their hind legs on their wings.

Locusts usually live a rather quiet life alone. But sometimes they reproduce so quickly that they become crowded together. This crowding causes some locusts to act differently. These locusts might form a swarm. They can fly for days or weeks over thousands of miles. When they finally stop, each locust can

eat more than its body weight in food. This can destroy farm fields very quickly.

Cicadas are often called locusts, but they are a different family of insects. The best-known type is called the 17-year cicada. It lives underground for 17 years before coming out. After a few weeks of activity, it dies.

London

Population
(2006
estimate),
7,512,000

London is the capital of the United Kingdom, a country in western Europe. It is also the capital of England, which is part of the United Kingdom. London lies on the Thames River. It is the largest city in the country. It has long been a major center of culture, business, and banking.

Places of Interest

London is an ancient city, and it has many historical sites. Since 1066 England's kings and queens have been crowned in a church called Westminster Abbey. The queen of England lives in Buckingham Palace. The Parliament meets in the Palace of Westminster. Its famous clock tower contains a huge bell called Big Ben.

London is known for its many museums. The British Museum is the world's oldest public museum. It is full of ancient treasures. The National Gallery has many European paintings.

Economy

London is one of the world's most important centers for banking, investing money, and insurance. The tourist industry is also important to the city's economy. In addition, many people in London work in government offices, schools, museums, and stores.

History

Romans founded the city in the 1st century AD. They called it Londinium (the name was eventually shortened to London). It was part of the Roman Empire for about 400 years. Later a Germanic people called the Saxons settled in London. William the Conqueror (William I), from Normandy in France, took control of England in 1066. He had a fortress built in the city. It was later called the Tower of London.

A double-decker bus drives past the clock tower at the Palace of Westminster. This tower contains a huge bell known as Big Ben. The tower is a famous sight in London.

A huge Ferris wheel called the London Eye sits along the Thames River in London, England.

London grew rapidly. Several times, however, a disease called the plague killed many people there. In 1666 a fire destroyed the city, but it was rebuilt.

Over the years the English built a huge empire, and London grew wealthy as the capital of the empire. The city was the center of the world's economy from the late 1700s to the early 1900s.

In 1940–41, during World War II, Germany repeatedly bombed London. The city was heavily damaged. After the war, London was rebuilt. In the early 21st century terrorists bombed London's public transportation system. However, the city continued to thrive.

Loon

Loons are large waterbirds known for their unusual wailing calls. They are excellent swimmers and divers. In fact, these birds are called divers in Great Britain. Their feet are webbed, and their legs are set far back on their bodies. These features help loons swim but make the birds almost unable to walk.

There are several species, or types, of loon. Loons live near freshwater lakes and ponds in northern regions. They are found in the northern parts of North America, Europe, and Asia. Loons migrate, meaning that they fly to warmer areas for the winter.

Loons are about 2–3 feet (60–90 centimeters) long. They have stout bodies and pointed bills. Their wings are small and pointed. Their feathers are mainly black, brown, or gray on the upper body and white below.

Except for penguins, no birds are better divers than loons. Loons sometimes

The common loon is also known as the great northern diver.

dive 200 feet (60 meters) below the surface of the water. They can stay underwater for three minutes or more. Loons put these skills to good use in catching fish and other small water animals to eat.

Loons make a wide variety of calls. They use some calls to frighten away invaders and others to locate or greet mates. Many people think the calls sound like eerie laughing, yodeling, wailing, or hooting.

Loris

Lorises are slow-moving mammals with enormous eyes. They are primates, as are lemurs, tarsiers, monkeys, apes, and human beings. Lorises live mainly in the tropical rain forests and bamboo groves of India and Southeast Asia.

Lorises measure about 7 to 15 inches (18 to 38 centimeters) long. They have round faces, small ears, and dark patches around their large eyes. Their thick fur is gray or brown. Lorises have a short, stubby tail or no tail at all. They have short, thick fingers and toes that are capable of an extremely powerful grip. The second toe on each foot has a long claw for grooming.

The animals live in trees and rarely venture to the ground. They are slow and careful climbers and do not leap from tree to tree. They spend their days rolled

The strong hands and feet of a loris help it to climb trees. Its large, round eyes help it to see in the dark.

up in a tight ball, fast asleep. When night arrives, they begin searching for food.

Lorises feed on insects, fruit, and plant shoots. They also eat small birds and their eggs and even small mammals and lizards. When a loris spots a possible meal, it often launches a surprise attack. It firmly grips a branch with both feet and stands straight up. Then, still holding on, it throws its body forward and grabs the prey with both hands.

Gestation, or pregnancy, lasts about six months. The female usually gives birth to a single offspring. Lorises may live as long as 14 years.

Los Angeles

Population
(2000 census),
city, 3,694,820;
(2007 estimate)
3,834,340

Los Angeles is the second largest city in the United States, after New York City. It lies on the Pacific Ocean in the southern part of the state of California. The Los Angeles area is very spread out. It includes both beaches and mountains. The city is famous for its movie industry, celebrities, and sunshine, as well as for its pollution and traffic jams.

Places of Interest

Hollywood, the center of the U.S. motion picture industry, is a district in Los Angeles. Many movies and television shows are filmed in Hollywood studios. Universal Studios also includes a movie-related theme park. The Kodak Theatre hosts the yearly Academy award

Classical music concerts are held at the Walt Disney Concert Hall in Los Angeles, California.

presentations. Celebrities are also honored with displays at the Walk of Fame and Mann's Chinese Theatre.

Los Angeles surrounds the city of Beverly Hills. It is known for its movie-star residents and expensive stores.

Concerts, plays, and dance performances are held at the Los Angeles Music Center. It includes the Walt Disney Concert Hall, home of the city's orchestra. The Getty Museum displays a large art collection. Los Angeles also has a number of professional sports teams.

Economy

The entertainment industry and tourism are important to Los Angeles' economy. Trade, health care, and other services also bring money to the city. Los Angeles is a major manufacturing center. Factories in the area process oil and make airplanes, spacecraft, toys, clothing, and electronics.

History

Los Angeles grew around a Spanish religious settlement called a mission. Settlers founded the town in 1781. It was ruled by Spain and later Mexico. In 1846, during the Mexican War, U.S. forces captured Los Angeles.

Los Angeles grew very rapidly. Its population went from about 11,000 in 1880 to more than 1 million in 1930. The growth of the movie business and other industries attracted more people to the city. In the early 21st century Los Ange-

les was still one of the fastest-growing cities in the United States.

Louis XVI

The painting shows Louis XVI in formal dress.

Louis XVI was the last king of France before the French Revolution. During the revolution he lost his kingdom and then his life.

Early Life

Louis was born on August 23, 1754, in Versailles, France. In 1765 his father died. When Louis was only 15 years old, he married Marie-Antoinette of Austria. Louis's grandfather King Louis XV died on May 10, 1774. Louis then became king.

Reign

Louis was a weak king. He hired people who tried to make the government fairer

and more modern. However, the French nobles stopped these efforts.

Louis also sent ships and troops to support the American Revolution. He did this because he wanted to make trouble for Great Britain. This effort was a success, but it cost more than the kingdom could afford to pay.

By 1789 the French people were very angry about France's money problems and Louis's weakness. They also disliked Marie-Antoinette. The king needed help, so he called together the Estates-General. This was a group of representatives made up of nobles, church leaders, and common people. But the representatives could not work together to solve France's problems.

In July 1789 the common people began the French Revolution. Louis remained king, but he grew afraid. In 1791 he tried to slip out of France and into Austria. The French people caught him and took him back to his palace.

Last Days

Revolutionary troops took Louis prisoner in August 1792. In September France became a republic—a nation ruled by the people instead of a king. The people tried Louis for treason (betraying his country), and he was found guilty. On January 21, 1793, in Paris, France, the French people put King Louis XVI to death.

Did You Know?

The younger brother of Louis XVI became king of France in 1814. He was known as Louis XVIII.

Louisiana

The U.S. state of Louisiana has a rich cultural history. Originally a Spanish and French colony, Louisiana existed as a settled area for a century before it became part of the United States. The French explorer Sieur de La Salle chose the name Louisiana in honor of King Louis XIV of France. The capital is Baton Rouge.

Geography

Louisiana is located in the southern part of the United States. It is bordered by the state of Mississippi, the Mississippi River, and the Pearl River to the east; by Arkansas to the north; by Texas and the Sabine River to the west; and by the Gulf of Mexico to the south.

Louisiana is one of the flattest states in the nation, and much of the area around the Gulf coast is below sea level. The

state has thousands of miles of swamp-land around the mouth of the Mississippi River. Waterways known as bayous pass through this area. Louisiana has a humid climate that is hot in the summer and mild in the winter. Hurricanes coming out of the Gulf have often battered the coastal areas.

People

About two thirds of Louisiana's people are whites of European heritage and about one third are African American. Descendants of the early French and Spanish colonists are called Creoles. Many of them are of mixed ancestry.

During the mid-1700s a group of French-speaking people moved to Louisiana from Canada. Their descendants are known as Cajuns. They often live in their own communities and speak their own language, a combination of French and other languages.

Economy

Louisiana is among the nation's leading producers of oil, natural gas, and salt. The state's main industries include chemical manufacturing and oil refining. Paper goods, fabricated metals, transportation equipment, and processed foodstuffs such as sugar are other chief industrial products.

Sugarcane (for sugar) is the state's main agricultural crop. Other major farm products include cotton and cattle. The fishing industry in Louisiana provides

Oak trees line an avenue leading to one of Louisiana's old plantation homes.

shrimps, oysters, and other seafood. Service-based industries, such as tourism, commercial sales, government, health care, and finance, play vital roles in the state's economy. One of the main tourist destinations is the city of New Orleans. In 2005 the city was badly damaged by flooding caused by Hurricane Katrina, but it soon began to rebuild.

History

There were several Native American tribes in the region when Europeans began settling in the Louisiana area. The Caddo were the largest group, but the Tunica, the Choctaw, and others also lived in the area.

The Spanish were the earliest Europeans to explore the area. But the French were the first to settle it, beginning in about 1702. In 1803 the United States bought the region from the French as part of the

Louisiana Purchase. Louisiana became a U.S. state in 1812.

In the 1800s there were many large Louisiana farms called plantations. Plantations depended on slave labor. Louisiana therefore joined other slave-owning states in the Confederacy during the American Civil War (1861–65). Louisiana rejoined the Union in 1868. Through most of the 1900s, the state had to deal with issues of discrimination against African Americans.

Louisiana faced another great challenge in 2005. In that year Hurricane Katrina broke down the barriers that protected the city of New Orleans from flooding. Hundreds of thousands of people lost their homes in the disaster. Many had to leave the state.

Louisiana Purchase

In 1803 the area of the United States was much smaller than it is today. In that year, however, the country bought the Louisiana Territory from France. The territory stretched from the Mississippi River to the Rocky Mountains, and from the Gulf of Mexico to Canada. The Louisiana Purchase doubled the size of the United States.

Historical Background

A French explorer named Sieur de La Salle had claimed Louisiana for France in 1682. He named the territory after the French king Louis XIV. It originally included land on both sides of the Mississippi River.

In 1762 France gave the part of Louisiana west of the Mississippi to Spain. The rest they gave to Great

Britain. It became part of the United States after the American Revolution. In the late 1700s settlers from the eastern part of the United States started moving into the area. Spain allowed them to use the Mississippi River and the port city of New Orleans, near the river's mouth.

In 1801 the powerful French leader Napoleon got the territory back. This worried the U.S. settlers. They were afraid that France might try to interfere with traffic on the river.

The Purchase

President Thomas Jefferson first tried to buy just New Orleans. Napoleon ignored him until Jefferson threatened to join forces with Great Britain, France's worst enemy. Napoleon also needed money to pay for the many wars he was fighting. For these reasons, he offered to sell the entire Louisiana Territory. The price was about 15 million

dollars. This amounted to only 3 cents per acre.

The Louisiana Purchase added 828,000 square miles (2,144,520 square kilometers) to the United States. The country eventually carved 13 states, either in whole or in part, from the territory. These states were Arkansas, Colorado, Iowa, Kansas, Louisiana, Minnesota, Missouri, Montana, Nebraska, North Dakota, Oklahoma, South Dakota, and Wyoming.

Lung

Lungs are baglike organs, or body parts, used for breathing. They are part of the body's respiratory system. All animals

Ribs protect both lungs. The diagram shows the inside of one lung, with the ribs cut away.

that have a backbone and breathe air have lungs. When an animal inhales (breathes in), air filled with oxygen flows into the lungs. When an animal exhales (breathes out), a gas called carbon dioxide and water vapor flow out of the lungs.

Structure

A body has two lungs, one on each side of the chest. The heart is located between the lungs. The right lung has three rounded sections called lobes. The left lung has two lobes. The base of each lung rests on a strong sheet of muscle called the diaphragm. In normal breathing the diaphragm and the muscles between the ribs automatically tighten and relax. This movement helps the lungs to fill with air and to empty.

Air enters and leaves the lungs through a series of tubes. A large, tough tube called

the trachea, or windpipe, connects the top of the throat to two branching tubes called bronchi. Each of these tubes leads to a different lung. The bronchi then divide into a web of smaller tubes called bronchioles. The bronchioles lead to tiny sacs called alveoli.

Jobs of the Lungs

When an animal breathes in, the oxygen in the air passes through the walls of the alveoli into tiny blood vessels called capillaries. Red blood cells then pick up the oxygen and take it to cells throughout the body. The blood also carries wastes, including carbon dioxide and water vapor, back into the lungs. The lungs send the wastes out of the body when the animal breathes out.

The lungs also trap and get rid of harmful substances from the air. A sticky liquid called mucus lines the lungs and the tubes leading to the lungs. The mucus traps harmful substances such as pollution and bacteria. Mucus and harmful substances leave the lungs when an animal coughs.

Lung Diseases

Most problems with the lungs can cause coughing, chest pain, and trouble with breathing. Pneumonia and tuberculosis are serious infections of the lungs. Emphysema and lung cancer are deadly diseases of the lungs. Smoking is one of the main causes of emphysema and lung cancer.

Did You Know?

The lungs of an average person contain more than 600 million alveoli.

Lusaka

Population
(2005
estimate), urban
area,
1,260,000

Lusaka is the capital of Zambia, a country in southern Africa. It is the largest city in Zambia. It is also the center of the country's economy.

Many people in Lusaka work for the government or businesses that provide services. Farmers from surrounding areas sell their crops and livestock in the city. Factories in Lusaka make cement and processed foods and drinks.

People have lived in the Lusaka area for thousands of years. In the 1890s a British company took control of the area. Lusaka was founded in 1905 as a station on a railway line. Great Britain made the area into a colony in 1924. Lusaka became the capital of the colony in 1935.

Lusaka was the center of a political movement seeking to end British rule in the area. In 1964 Zambia became an independent country with Lusaka as its capital. Since then the city has grown rapidly.

Lusitania

The *Lusitania* was a famous British steamship of the early 1900s. A German submarine sank the *Lusitania* in the Atlantic Ocean during World War I. Almost 1,200 people died, including 128 U.S. citizens. Partly because of this attack, the United States entered World War I in 1917.

Germany and Great Britain were enemies in World War I. The Germans warned that they would try to sink the *Lusitania*. They said that the ship carried weapons as well as passengers. British officials told the captain of the *Lusitania* that German submarines had sunk other ships along the *Lusitania*'s route. The captain ignored the warnings.

On May 7, 1915, the *Lusitania* was near the coast of Ireland when it was attacked. A German submarine fired a torpedo that struck the ship. The *Lusitania* sank within 20 minutes. Only about 750 people survived.

The *Lusitania* docks at a crowded port.

The attack angered many people in the United States. They wanted their country to declare war on Germany. But for two years the United States stayed out of the war. The United States finally entered the war in 1917. It said that German submarine attacks were one of the reasons for its decision.

Luther, Martin

The German priest and scholar Martin Luther began the Reformation in 1517. This movement at first sought to change, or reform, the Roman Catholic church. Instead it led to the establishment of Protestantism, one of the major branches of Christianity. The Protestant church known as Lutheran grew out of Luther's teachings.

A picture from the 1800s shows Martin Luther.

Early Life

Luther was born in Eisleben, Saxony (now in Germany), on November 10, 1483. In 1507 he became a Roman Catholic priest.

Meanwhile, Luther began having doubts about some practices of Roman Catholicism. For example, the church accepted money in order for sins to be forgiven. This practice was known as the selling of indulgences. Luther came to believe that God forgives sins only because of one's faith. He also thought the church was too powerful.

Efforts at Reform

In 1517 Luther wrote a list of 95 theses, or statements of his beliefs, about religion. Luther continued to write and teach on the subject of reforming the church, and his views began to gather support.

Luther's actions angered powerful church leaders. The pope (the leader of Catholicism) excommunicated, or barred, him from the church in 1521. Later that year the government declared Luther an outlaw, and he fled to a castle near Eisenach. While in hiding, he translated the New Testament into German so that more people could read it.

Luther spent the rest of his life writing, preaching, and organizing the reformed church in Saxony. He died on February 18, 1546, in Eisleben.

Luxembourg

Vianden Castle in Luxembourg was completed in the 1300s.

Luxembourg is one of the world's smallest countries. Its capital is Luxembourg city.

Geography

Luxembourg is surrounded by Belgium, Germany, and France. The land includes rolling hills and deep river valleys. The northern third of the country is part of the Ardennes Mountains. The rest of the country has a more varied landscape. A large beech forest called the Müllerthal

lies in the east-central part of the country.

People

More than half of the country's people are Luxembourgers. They speak Luxembourgian, a mixture of German and French. Most people also speak the German and French languages. Most of the people are Roman Catholics.

Economy

Banking, tourism, and other services are the most important parts of the economy. Luxembourg also produces iron and steel, machinery, chemicals, tires, and other goods. Agriculture is a small part of the economy. Crops include barley, wheat, oats, potatoes, and grapes for wine. Cattle and pigs are the main livestock.

History

The Franks, the Holy Roman Empire, and other powers controlled the region for centuries. Luxembourg became a separate state in AD 963. In 1354 the region became a duchy, or a state ruled by a duke. A series of foreign powers controlled the duchy beginning in the 1400s.

Luxembourg gained full independence in 1867. Today its ruler is still called a grand duke, but a prime minister actually runs the government.

Lyme Disease

Lyme disease is an illness caused by tiny living things called bacteria. Small insects called ticks carry the bacteria and spread the disease.

Ticks sometimes bite humans to feed on their blood. If a tick carries the bacteria that cause Lyme disease, it can pass the bacteria to a person through its bite. The person may then become sick with Lyme disease.

One of the first signs of Lyme disease is often a circular red rash. The rash usually appears in the area of the tick bite. The person may then experience headaches, muscle aches, joint pain, fatigue, and fever.

People who have had Lyme disease for a long time may become sicker. They may have numbness in their feet and hands. They also may be confused and unable to concentrate.

Lyme disease often starts with a red rash in the shape of a circle.

Did You Know?

The name Luxembourg comes from an old Roman castle in Luxembourg city called Lucilinburhuc, meaning "little fortress."

Lyme disease can be treated with antibiotics. Antibiotics are a kind of medicine that kills bacteria. If a person with Lyme disease is not treated early on, it may become more difficult to cure the disease.

The best way to prevent Lyme disease is to stay away from places with ticks. Ticks often live in shady, wooded areas. People also can use an insect spray to keep ticks away. If ticks do land on the skin, people should remove them immediately.

Lymphatic System

Humans and many other animals have a lymphatic system, which helps the body to fight disease. In this way the lymphatic system is a part of the immune system. The lymphatic system also carries fluid throughout the body. In this way it is a part of the circulatory system. Major parts of the lymphatic system include the lymphatic vessels, the lymph nodes, and cells called lymphocytes. The spleen, the tonsils, the appendix, bone marrow, and the thymus also belong to the lymphatic system.

Lymphatic Vessels

Lymphatic vessels run throughout the body. These vessels collect extra fluid from the body's tissues. This fluid is called lymph. Lymph carries wastes and

The lymphatic system fights disease and carries fluid throughout the body.

Lymph vessels and blood vessels both carry white blood cells. But lymph vessels carry lymph, not blood. They also carry nutrients that would not fit inside small blood vessels.

certain nutrients, especially proteins. Lymph flows from the lymphatic vessels into the blood at a vein near the heart.

Lymphatic vessels also collect foreign substances, called antigens, from the tissues. Antigens include such things as bacteria and viruses, which can cause disease.

Lymph Nodes and Other Organs

Lymph nodes, or lymph glands, are small, bean-shaped organs. The human body has thousands of lymph nodes.

They are found at certain points along the lymphatic vessels. They are clustered in such places as the neck, the armpits, the knees, and the groin. Lymph nodes remove antigens from the lymph. Lymph nodes also hold antigen-fighting cells called lymphocytes.

Other organs of the lymphatic system also contain lymphocytes. The spleen sits behind the stomach. It filters antigens from the blood. The tonsils trap antigens in the throat. The appendix and other areas in the intestines trap antigens, too.

Lymphocytes

Lymphocytes are white blood cells. They begin in bone marrow, which is a soft tissue inside the bones. Some lymphocytes, called B cells, develop in the bone marrow. Other lymphocytes, called T cells, travel to the thymus to develop further. The thymus is a pyramid-shaped organ that lies beneath the breastbone.

Lymphocytes travel through the lymph and the blood. They collect in the lymph nodes and other lymphatic organs. They work to destroy antigens that could harm the body.

Lynx

Lynx are wild cats that live in the forests of Europe, Asia, and northern North America. They are known for their sharp vision.

Lynx are about 30 to 40 inches (80 to 100 centimeters) long, without the short tail. They weigh 20 to 45 pounds (9 to 20 kilograms). Lynx have long legs and large, furry paws that help them move through snow. Their thick fur helps to keep them warm in cold weather. The fur is yellowish brown to gray, with darker brown and black patches. It is bushy on the neck. The ears and tail have black hair at the tip.

Lynx live alone or in small groups. They hunt at night. Lynx eat birds and small animals. Some lynx, such as the Eurasian

Lynx have large paws that help the animals move through snow.

lynx, will eat larger prey such as deer. Canadian lynx eat mostly snowshoe hares. Lynx like to sneak up on their prey rather than chase it down.

Lynx are good swimmers and climbers. They also can make great leaps. Lynx are generally silent, except during the mating season.

Lynx are closely related to the bobcat and the caracal. The bobcat is also called the bay lynx. It is common to many parts of the United States and has yellowish brown fur tinged with red. Its fur also has black spots. The caracal is sometimes called the Persian, or desert, lynx. It is found in hills, deserts, and plains of Africa, the Middle East, and Asia. It has a reddish brown coat.

Macau

Macau is a special administrative region of China. Macau is part of China, but it controls many of its own affairs.

Part of Macau is a small piece of land connected to China's southern coast. The capital city, also called Macau, covers most of that land. The region of Macau also includes two nearby islands in the South China Sea.

Most of the people who live in Macau are Chinese. There are also some Portuguese. Most Chinese in Macau practice Buddhism. The Portuguese are mainly Roman Catholic.

Trade is very important to Macau's economy. Macau is a free port. That means that ships from anywhere in the world may use the port without paying special taxes. Tourism and gambling also bring a lot of money to Macau.

People have lived in what is now Macau for at least 4,000 years. The rulers of China controlled the area over the centuries. Portuguese ships started arriving in Macau in 1513. Portugal used Macau as a base for trading with China and Japan. The Portuguese put a governor in charge of Macau, but the Chinese held most of the power.

In 1974 Portugal gave Macau more control over its own affairs. Macau was officially returned to Chinese rule in 1999.

Macdonald, John

John Macdonald was the first prime minister of Canada. He was born on January 11, 1815, in Glasgow, Scotland. His family moved to what is now Ontario in 1820. Alexander attended school there and became a lawyer in 1836.

At that time the land that is now Canada consisted of various territories ruled by Great Britain. In 1841 the British Parliament combined Canada West (now Ontario) and Canada East (now Quebec) to create the Province of Canada. Macdonald was elected to the assembly of the Province of Canada in 1844.

Great Britain ruled several other territories as well. Macdonald worked to bring them all together into one country. In 1867 the British North America Act created the Dominion of Canada. It included the Province of Canada, Nova Scotia, and New Brunswick. Macdonald became its first leader, or prime minister.

Under Macdonald's leadership, the dominion soon expanded to include the provinces of Manitoba (1870), British Columbia (1871), and Prince Edward Island (1873). In 1873 Macdonald was forced to resign because the government was accused of taking bribes. However, he returned as prime minister five years later and served until his death on June 6, 1891, in Ottawa, Ontario.

Macedonia

Macedonia is a small country in south-eastern Europe. It is part of a region called the Balkans. Its capital is Skopje.

Macedonia borders Serbia, Kosovo, Bulgaria, Greece, and Albania. The Vardar River flows through the center of the country. Many mountains cover the land.

Forests cover the mountains of Macedonia. Wolves, bears, lynx, wild pigs, lizards, and other animals live in the country.

Most of the people are ethnic Macedonians. They speak a language called Macedonian. Other ethnic groups include Albanians, Turks, Roma (Gypsies), and Serbs. More than half of the people are Eastern Orthodox Christians. Nearly one third are Muslims.

Many Macedonians work in services, including communications, government

The Monastery of Saint Naum in southern Macedonia was built in the 900s.

work, and health care. Industry and agriculture are also important to the economy. Factories make cloth, metals, construction materials, and other goods. Mines provide lead and coal. Farmers grow wheat, potatoes, wine grapes, tomatoes, and tobacco.

People lived in the region of Macedonia as early as 7000 BC. By the 300s BC King Philip II ruled an empire that included nearly all of Greece. His son Alexander the Great expanded the empire. Later other groups conquered Macedonia. By the 1300s most of Macedonia belonged to the Turkish Ottoman Empire.

The Kingdom of Serbs, Croats, and Slovenes took over Macedonia in 1918. The kingdom was renamed Yugoslavia in 1929. Macedonia gained independence in 1991.

Machine

A machine is a device that does a physical task. Some machines make moving or lifting things easier. Other machines carry people from place to place. Yet

other machines help in building or making things.

Simple Machines

The most basic machines are called simple machines. They are the inclined plane, the wedge, the lever, the wheel and axle, the screw, and the pulley. Simple machines change the strength or direction of a force, such as a push or pull.

An inclined plane is a flat surface that is raised at one end. It takes less force to move an object up along an inclined plane than it does to lift it straight up. Ramps and sloping roads are examples of inclined planes.

A wedge is a piece of material that narrows to a thin edge. Pushing the wedge in one direction creates a force in a sideways direction. The head of an ax is a wedge. Swinging the ax into a log can split the log apart.

A lever is a bar or board that rests on a support called a fulcrum. A lever can transfer and increase the force applied to one end of it. People use levers to move heavy objects or to pry things loose. A hammer acts as a lever when used to pry a nail from a board. The part of the hammer that rests on the board is the fulcrum.

An axle is a shaft, or rod, that is fixed to the center of a wheel. In some wheel-and-axle machines the wheel is replaced with a crank or another part that turns in a circle like a wheel. A steering wheel in a car is a wheel-and-axle machine.

The six simple machines are used in a variety of everyday objects.

Another example is a doorknob. A doorknob is a wheel that turns an inner shaft (axle) that moves the latch.

A screw is a thin rod with edges, or threads, that curve around it. Turning a screw produces a force that can push the screw into wood or tighten it against a nut. Similar threads are used on jars and other containers so that lids close tightly.

A pulley is a wheel with a rope or something similar around its edge. The pulley changes the direction of the force applied to one end of the rope. For example, by pulling down on one end of the rope, a person can lift an object attached to the other end.

Compound Machines

Simple machines can be combined to create compound machines. Compound machines can be as small as a mechanical watch or as large as a construction crane.

A crane is a machine that makes lifting heavy objects easier.

In a compound machine, forces and motion are transferred from one part to another. One way this is done is with gears. A gear is typically a circular piece of metal with teeth, or ridges, along its outer edge. The teeth of one gear fit into those of another. When one gear turns, it also turns the other gear. Another way of transferring forces and motion is with a type of pulley that uses a chain or a band of flexible material called a belt.

A bicycle is an example of a compound machine that uses a chain to transfer force. The chain runs around two separate toothed wheels, which act as pulleys. One is attached to the axle of the rear wheel. The other is attached to the pedals through an axle. The pedals work like the crank of a wheel-and-axle machine. The force used to turn the pedals becomes a stronger turning force on the axle and its toothed wheel. The chain transfers the force to the rear wheel and makes it turn. In some bicycles the chain can be shifted between

A mechanic puts together complex machinery that will power an airplane.

toothed wheels of different sizes. This changes the amount of force the rider needs to turn the rear wheel.

Machu Picchu

In the mountains of south-central Peru stands Machu Picchu, a deserted city of the Inca people. The name Machu Picchu means “old peak” in Quechua, the language of the Inca. The dwellings at the site were probably built and occupied from the mid-1400s to the early or mid-1500s. Machu Picchu is one of the few American Indian sites dating from that long ago to be found nearly intact.

Machu Picchu is located about 50 miles (80 kilometers) northwest of the city of Cuzco, which was the capital of the Inca Empire. It lies between two sharp peaks in the eastern Andes Mountains, at a height of 7,710 feet (2,350 meters). Mountain forest surrounds the site.

Mountains and forests surround the ruins of Machu Picchu.

Machu Picchu is divided into two sections, one farming and one urban. The farming section is made up of steplike fields called terraces. The Inca used the terraces for growing crops such as corn and sweet potatoes. The urban section has plazas, temples, houses, and a cemetery. They are connected by walkways and thousands of stone steps.

Most of the structures are very well preserved because of the quality of Incan engineering and stonework. One notable structure is the Temple of the Sun. Once a year sunlight shines through a window onto the middle of a large stone. This stone was a sort of calendar. Another famous structure is a pillar known as the Intihuatana. The pillar was probably used to keep track of the seasons.

The role of Machu Picchu in Incan society is not entirely understood. Many archaeologists believe it was the estate of a powerful Inca emperor. They do not know why the site was abandoned. Lack of water may have been a reason.

Machu Picchu remained hidden from the Spanish when they conquered the Inca in the 1500s. Plants grew over the site, and for hundreds of years it was known only by a few people who lived in the area. The world learned of Machu Picchu when a local farmer led a U.S. archaeologist to the ruins in 1911. Today Machu Picchu is a popular tourist attraction.

Madagascar

Madagascar is an island country located off the southeastern coast of Africa. The island is the fourth largest in the world. Only Greenland, New Guinea, and Borneo are larger. Madagascar is known as the Great Red Island for its rich, red soil. Its capital is Antananarivo.

Geography

Madagascar lies in the western Indian Ocean. The Mozambique Channel separates the island from the African coast.

The central part of Madagascar is a plateau, or high, flat land. Mountains rise above the plateau in some places. Maromokotro Peak in the north is the island's highest point. It rises 9,436 feet (2,876 meters). A narrow plain runs along the east coast. Low plateaus and plains cover the west. Rivers are short and fast flowing in the east and longer in the west.

The east coast has a hot, humid tropical climate. The central plateau is cooler. The southwest is dry.

Plants and Animals

Grasses cover most of the island. Some tropical forests and mangrove swamps survive on the coasts. Hundreds of different kinds of orchid also grow in Madagascar.

Madagascar has many types of animals that live almost nowhere else in the world. Two examples are lemurs and fossas. Lemurs are monkeylike animals

that live in trees. Fossas are catlike mammals that hunt birds and lemurs. Many butterflies, chameleons, and crocodiles also live in the country.

People

Madagascar's people are known as the Malagasy. The Malagasy are more closely related to Indonesians than to Africans, even though the country is closer to Africa than to Indonesia. The Malagasy are divided into about 20 groups. The Merina make up the largest group. The country also has small groups of people from Africa, Asia, France, and the nearby island country of Comoros.

Many people of Madagascar speak both the Malagasy and French languages. About half of the people are Christian, and most of the rest follow traditional Malagasy religions. Fewer than one third

Antsirabe, Fia-
narantsoa,
Mahajanga

of the people live in cities. Almost all the major cities and towns are in the east.

Economy

Madagascar is a poor country. Most of the people live by growing crops and by raising humped cattle called zebu. Rice is the main food crop. Farmers grow vanilla and cloves to sell to other countries. Madagascar also produces coffee, sugar, and shrimp.

Madagascar's small industries make mainly cloth, clothing, cement, soap, beer, and cigarettes. Mines provide chromite, graphite, gold, and gems.

History

People first came to Madagascar from Indonesia more than 1,000 years ago. Arab traders arrived on the island before AD 1000. The first Europeans to visit

Madagascar were Portuguese sailors, who first arrived in 1500. The French set up trading posts in the 1600s.

Around this time the Malagasy began to develop kingdoms. The Malagasy traded slaves to the French in return for weapons. The Merina kingdom conquered much of the island by the early 1800s. The French defeated the Merina in 1895. France then ruled the island as a colony. The island became the independent Malagasy Republic in 1960.

In the 1970s the country's military took power. The country took the name Madagascar in 1975. In 1992 Madagascar held free elections for the first time in 17 years. The new government worked to improve the economy.

Madison

Population
(2000 census)
208,054;
(2007 estimate)
228,775

Madison is the capital of the U.S. state of Wisconsin. It is nicknamed the City of Four Lakes. Part of the city lies on a narrow strip of land between Lakes Monona and Mendota. Two other lakes are located nearby. The city is a center of government, culture, and education. The main campus of the University of Wisconsin is located in Madison.

Many people in Madison work for the university or the state government. Trade, manufacturing, and business services are important to the city's economy. High-technology companies and tourism also bring money to the city.

Native Americans settled in the area that is now Madison hundreds of years

ago. Madison was founded in 1836. It was named after former U.S. President James Madison. Later in 1836 Madison was chosen to be the capital of the Wisconsin Territory. Wisconsin became a U.S. state in 1848, with Madison as its capital.

Wisconsin

Madison, James

James Madison was the fourth president of the United States. He is known as the Father of the Constitution for his role in the Constitutional Convention of 1787. He also led the country through the War of 1812.

Early Life

James Madison was born in Port Conway, Virginia, on March 16, 1751. His parents were James Madison, Sr., and Eleanor Rose Conway. Madison lived most of his life at Montpelier, his family's plantation. He graduated from the College of New Jersey (now Princeton University) in 1771.

Political Career

In 1776 Madison helped to write Virginia's constitution. In 1779 he was elected to the Continental Congress, where he served until the end of the American Revolution.

In 1784 Madison entered the Virginia legislature. He then helped bring about the U.S. Constitutional Convention. In 1787 the convention met in

The Wisconsin state Capitol is in Madison.

James Madison

Philadelphia, Pennsylvania, to create a system of government for the United States. Many of Madison's ideas, including his support of a strong central government, went into the new U.S. Constitution.

In 1789 Madison was elected to the new House of Representatives. There he

helped pass the Bill of Rights, the first 10 amendments to the Constitution. During his time in Congress Madison came to believe that the federal government should not have more power than the states. He shared that opinion with his friend Thomas Jefferson.

In 1794 Madison married Dolley Payne Todd. They had no children together.

In 1801 President Jefferson made Madison secretary of state. They worked together to buy the Louisiana Territory from France in 1803.

Presidency

Madison won election as president in 1808. He was reelected in 1812. That year the United States entered the War of 1812 against Great Britain. The United States won some victories at sea but lost many land battles. In August 1814 the British invaded Washington, D.C., and burned the White House.

TIMELINE

Madison is born in Port Conway, Virginia.

March 16, 1751

Madison helps make the Louisiana Purchase.

1803

The War of 1812 begins.

1812

Madison dies in Montpelier, Virginia.

June 28, 1836

Madison attends the Constitutional Convention.

Madison is elected president.

Madison retires to his plantation.

When the war ended in 1814, there was no clear winner.

Retirement

Madison retired to Montpelier in 1817. He supported Jefferson in founding the University of Virginia. He also worked to end slavery. Madison died on June 28, 1836.

Madrid

Population
(2007 estimate), city, 3,132,463; urban area, 5,764,000

Madrid is the capital of Spain, a country of western Europe. It is Spain's largest city. It is also a major center of the arts, education, business, industry, and transportation.

Places of Interest

The heart of Madrid is a plaza called the Puerta del Sol (Door of the Sun). From this plaza spread the city's busiest streets. Madrid's older section centers around the Plaza Mayor. It is a large square built in the 1600s.

Madrid's Plaza Mayor is a popular meeting place.

Madrid has many museums. The Prado Museum is one of the most important art museums in Europe. It is best known for its paintings by the Spanish artists Diego Velázquez and Francisco de Goya.

Economy

Madrid is Spain's center for banking and insurance. Construction and service industries such as tourism and publishing also bring money to the city. Many Spanish businesses have their headquarters in Madrid. Manufacturing is also important. Factories in Madrid make such products as cars, airplanes, electronics, plastics, and rubber.

History

People have lived in the Madrid area for thousands of years. By the 900s it was a small fortress town of Muslims from northern Africa. A Spanish Christian king named Alfonso VI captured the town in 1083.

Madrid remained small and unimportant until it became the Spanish capital. In 1561 King Philip II made it the center of his royal government. In 1607 King Philip III made Madrid the official capital of Spain.

France controlled Madrid for a few years in the early 1800s. During the Spanish Civil War (1936–39) Madrid suffered heavy bombing.

Madrid grew greatly in the second half of the 1900s. It also became the target of several terrorist attacks. In 2004 almost 200 people were killed when terrorists bombed several trains in the city.

Magazine

A magazine is a printed collection of writings that is published a certain number of times a year. Many magazines are published monthly or weekly. Magazines typically contain articles, pictures, and letters from readers. They often are printed on glossy, high-quality paper. Magazines are more up-to-date than books but more permanent than newspapers.

The most recently published magazines are called current issues. Magazines sold on newsstands and in stores are generally current issues. Older issues, called back issues, can be found in libraries or on the Internet.

Did You Know?

Magazines are also called periodicals.

Types of Magazines

Stone Soup is a magazine by and for children. The stories, poems, and illustrations in the magazine are created by children themselves.

There are many kinds of magazines. Magazines such as *Time* and *Newsweek* are meant for many different readers. They cover news, business, entertainment, and other subjects. Other magazines focus on one subject. For instance, *National Geographic* covers geography, and *Wired* discusses computers. Many magazines are aimed at a certain group, such as teenage girls or African Americans.

Digests are collections of articles on a number of different subjects. *Reader's Digest* is probably the most popular of this type of magazine.

Scientific or scholarly magazines are often called journals. Professors usually read and write them, and universities often publish them.

Some people make their own magazines at a low cost. These publications, called zines, are often copied on regular paper and stapled together. Beginning in the 1990s, many people put their zines on the Internet.

History

The invention of the printing press in the middle of the 1400s made magazines possible. One of the earliest magazines was published in Germany in the 1660s. A few years later specialized magazines on the arts and sciences appeared in England and France. The French magazine *Le Mercure galant*, first published in 1672, was the first magazine meant for entertainment.

Many magazines on politics and literature appeared during the 1700s. Some of the greatest writers of this period created magazines or wrote for them. During the 1800s the reading audience grew, and new magazines were created for different groups of people. For example, women's magazines and children's magazines became popular. These magazines often included illustrations.

Photographs became common in magazines during the 1900s. Magazines also came to depend heavily on advertising. The sale of advertisements allowed publishers to keep magazine prices down, which attracted more readers.

Magellan, Ferdinand

Ferdinand Magellan was an explorer from Portugal. He and his sailors were the first Europeans to cross the Pacific Ocean. One of his ships made the first trip around the world, though he did not live to complete the voyage.

Early Life

Magellan was born in Portugal in about 1480. He came from a noble family. As a young man he served in the Portuguese navy. He fought in India and the East Indies. The East Indies are the islands between mainland Southeast Asia and Australia. Magellan helped Portugal win control of trade with the Moluccas, an island group in the East Indies. Europeans called the Moluccas the Spice Islands because they produced valuable spices.

Ferdinand Magellan

Portugal did not reward Magellan well for his services. Magellan was so angry that he went to work for Spain instead. The main purpose of his great voyage was to claim the Spice Islands for Spain.

Voyages

Magellan sailed from Spain in 1519 with five ships. He sailed across the Atlantic Ocean and down the coast of South America. In 1520 he found a passage to the ocean that the Spanish explorer Vasco Núñez de Balboa had first seen in 1513. Magellan named it the Pacific Ocean. The passage, at the southern tip of South America, is now called the Strait of Magellan.

With three ships left, Magellan crossed the Pacific. After about 100 days he

reached the islands now called the Philippines. On April 27, 1521, he was killed in a fight with the people of the islands.

After Magellan's death two of his ships continued westward. One ship made it across the Indian Ocean and around the southern tip of Africa. It returned to Spain on September 8, 1522.

Magic

Magic is the art of performing tricks to make the impossible seem possible. Magicians amaze audiences by appearing to make objects disappear, read minds,

or float off the ground. But for thousands of years, people believed that magicians actually had special powers. They thought magicians could control other people and natural forces, such as the rain or the wind. People thought to have magical powers were also known as witches, wizards, and sorcerers.

Today most magic tricks involve “sleight of hand.” This is the ability to move objects, such as cards or coins, quickly and secretly. The secrets to many magic tricks are written down in books that anyone can read. It may take weeks or months to learn a trick, though. Many magicians, also called illusionists, carefully guard the secrets to their tricks.

One of the most famous magicians was Harry Houdini. He was known for his amazing escapes from handcuffs and straitjackets in the early 1900s. Other important magicians have included Doug Henning, David Copperfield, Penn and Teller, and David Blaine.

Magna Carta

A picture from the 1800s shows King John of England signing the Magna Carta.

The Magna Carta (Latin for “Great Charter”) was a document that gave certain rights to the English people. King John of England agreed to it on June 15, 1215. The Magna Carta stated that the king must follow the law. He could not simply rule as he wished. It was one of the first documents to state that citizens had such rights.

England’s nobles (called barons), church leaders, and the common people disliked King John. He demanded too much money from his people. The barons drew up the Magna Carta to limit his power. John was too weak to resist them.

The Magna Carta dealt mostly with the rights of barons and the Roman Catholic church. However, it also guaranteed the rights of women and children who inherited property. It stated that a per-

Two children entertain their family members with a magic show.

son could not be punished for a crime unless they were lawfully convicted. Finally, the Magna Carta gave barons the right to declare war on the king if he did not follow the document.

The Magna Carta was a first step in the creation of England's constitution. Many other countries later used the ideas of the Magna Carta in their constitutions, too.

Constitution

Magnet and Magnetism

A magnet is a rock or a piece of metal that can pull certain types of metal toward itself. The force of magnets, called magnetism, is a basic force of nature, like electricity and gravity. Magnetism works over a distance. This means that a magnet does not have to be touching an object to pull it.

What Causes Magnetism

People have known for a long time that a certain type of rock, called lodestone, is a natural magnet. When scientists learned why that is, they also learned how to make other metals into magnets.

Magnetism happens when tiny particles called electrons behave in a certain way. All objects in the universe are made up of units called atoms. Atoms in turn are made up of electrons and other particles (neutrons and protons). The electrons

spin around the atom's nucleus, which contains the other particles. The spinning electrons form tiny magnetic forces. Sometimes many of the electrons in an object spin in the same direction. In these cases, all the tiny magnetic forces from the electrons add up to make the object one big magnet.

It is possible to make a magnet by taking an existing magnet and rubbing another piece of metal with it. The new piece of metal must be rubbed continuously in the same direction. This will make the electrons in that metal start to spin in the same direction.

Electricity can also create magnets. Electricity is a flow of electrons. As electrons move through a piece of wire they have the same effect as electrons spinning around the nucleus of an atom. This is called an electromagnet.

Small, thin pieces of iron are attracted to a red bar magnet. The pieces of iron line up to show the magnetic field of the magnet.

Did You Know?

In the photo, the magnetic field is strong where the pieces of iron are close together. The field is weak where the pieces are far apart.

Bar magnets can show how unlike poles attract each other and like poles repel each other.

Hard and Soft Magnets

Because of the way their electrons are arranged, the metals iron, steel, nickel, and cobalt make good magnets. Once these metals become magnets, they can stay magnets forever. Then they are called hard, or permanent, magnets. But these metals and others can also act like magnets only sometimes, after they have been near a hard magnet. Then they are called soft, or temporary, magnets. Most other materials—for example, water, air, and wood—have very weak magnetic properties.

Properties of Magnets

Magnets strongly attract objects that contain iron, steel, nickel, or cobalt. Magnets also attract or repel (push away) other hard magnets. This happens because every magnet has two opposite poles, or ends: a north pole and a south pole. North poles attract the south poles of other magnets, but they repel other north poles. Likewise, south poles

attract north poles, but they repel other south poles.

The magnetic forces between the two poles of a magnet create a magnetic field. This is the area affected by the magnet. A magnetic field surrounds all magnets.

Uses

One of the earliest uses of magnets was in compasses. A compass is a needle-shaped magnet that is free to turn around. The planet Earth is a giant magnet. Because the south pole of a compass is attracted to the north pole of Earth, the compass needle always points north.

Today magnets are found in many places. Magnets hold papers on refrigerator doors. They also hold the doors shut. Credit cards have a magnetic strip. Automatic doors, stereo speakers, and many electric motors use electromagnets.

Magnolia

Magnolias are trees and shrubs. They are known for their large flowers. People plant magnolias in parks and gardens. Some magnolia wood is used to make furniture.

There are about 80 species, or types, of magnolia. They grow in North America, Central America, and Asia.

Many magnolias are about 40 to 80 feet (12 to 24 meters) tall. They usually have smooth, gray bark. Their leaves are large

Did You Know?

If a bar magnet is cut in half, each half becomes a complete magnet with a north pole and a south pole.

Magnolias are known for their large, beautiful flowers.

and oval. Some magnolias are evergreen. This means that they keep their leaves year-round. Others are deciduous. They lose their leaves in winter.

The flowers of a magnolia are white, yellow, pink, or purple. They can be 10 inches (25 centimeters) or more across. Most magnolia flowers have 6 to 12 large petals. They usually bloom in the spring and early summer. Some flowers have a beautiful smell. After flowering, magnolias produce a fruit shaped like a cone. Inside are reddish seeds. The fruit splits open in the fall. When this happens, the seeds hang down by thin threads.

Many types of magnolia are popular. The southern magnolia has large, white flowers that smell like lemons. The big-leaf magnolia grows up to 50 feet (15 meters) high. Leaves of the umbrella tree are 2 feet (61 centimeters) long. The cucumber tree is named after its fruits, which are shaped like cucumbers.

Flower

Magpie

Magpies are bold, noisy birds that have many calls. They belong to a group of birds called songbirds. However, their voices are rather harsh sounding. Like their relatives the crows, magpies are known for their intelligence. For instance, magpies hide objects and then remember where to find them again. People often keep these birds as pets.

Magpies are in the same scientific family as crows, ravens, and jays. There are several different species, or types, of magpie. Common types include the Eurasian magpie and the black-billed magpie.

Magpies live in Europe, Asia, Africa, and North America. These birds build nests in tall trees. However, they need open grasslands nearby for feeding. Thus they are often found at the edges of forests.

Magpies are intelligent, noisy birds.

Eurasian and black-billed magpies are about 18 inches (46 centimeters) long. They are mostly black except for their white bellies and white patches on their wings. They have long black tails. In sunlight their wings and tails look shiny blue or green. Several types of magpie found mainly in Asia have bright blue or green feathers.

Magpies eat many different kinds of food. They eat insects, dead animals, fruit, seeds, and even the eggs and chicks of other birds. When magpies have too much to eat all at once, they stash food away to eat later.

Magpies have a place in European folklore. Some people think of them as thieves. Others think they bring bad luck.

Mahogany

People prize mahogany trees for their hard, reddish brown wood. The most valued species, or types, of mahogany include the West Indies mahogany and the big-leaf mahogany. People have cut down so many of these trees that they are in danger of disappearing.

Mahoganies grow in the tropical areas of the Americas. West Indies mahoganies grow on the islands called the West Indies, in the Caribbean Sea. They also grow in the U.S. state of Florida. Big-leaf mahoganies grow in Central and South America.

The beautiful, hard wood from mahogany trees is often used to make fine furniture.

West Indies mahoganies are usually 40 to 50 feet (12 to 15 meters) tall. Big-leaf mahoganies may grow as high as 150 feet (45 meters). Both types have large, green leaves made up of several parts called leaflets. Mahoganies grow alone or in small clusters. There are no forests of these trees.

People value mahogany wood for its strength and its beautiful texture and color. They use the wood to make high-quality furniture, wood paneling, musical instruments, and boats.

Because so many people want mahogany wood, many of the trees have been chopped down. The trees take a long time to grow, so they are being lost faster than they can be replaced. Many businesses now use similar wood from Africa or the Philippines instead of true mahogany wood.

Tree

Maine

Maine is the largest of the U.S. states in the region known as New England. It is almost as big as the rest of New England combined. Despite Maine's physical size, it has a smaller population and fewer big cities than the other New England states. The capital is Augusta.

The origin of the state's name is uncertain. It may have been named for the former French province of Maine. Some historians believe that the state got its name for being the "mainland," as opposed to the coastal islands. Because of its great forests, Maine is nicknamed the Pine Tree State.

Geography

Maine is bordered on the northwest by the Canadian province of Quebec and on the northeast by the Canadian province of New Brunswick. The Atlantic Ocean forms the southern border. Maine's southwestern border is shared with the state of New Hampshire.

Maine is known for its rugged, scenic coast. Offshore there are about 1,200 small islands. However, most of the state consists of a rocky plateau with many lakes and valleys. The White Mountains (part of the Appalachian Mountains) extend from New Hampshire into western Maine. The state's highest point is 5,269-foot (1,606-meter) Mount Katahdin. Maine

has short summers and long, cold winters that can be very snowy.

Maine is heavily forested and contains a good deal of wildlife. Moose, deer, black bears, otters, muskrats, foxes, raccoons, and a variety of birds live there.

People

The Penobscot, the Passamaquoddy, and other Native American groups were living in what is now Maine when Europeans first arrived. Members of these groups still make up a small portion of Maine's population. The area was later settled mostly by English and Scots-Irish Protestants. Their descendants make up the majority of the population. The second largest group is of French heritage.

Camden is a scenic town on the coast of the U.S. state of Maine.

Nonwhites make up less than 4 percent of the population.

Only two fifths of Maine's people live in urban areas. Portland is the state's major seaport and its largest city. It has about 65,000 residents. Lewiston and Bangor are the only other cities with populations of more than 30,000.

The University of Maine is the state's largest public institution of higher education. Its main campus was founded at Orono in 1865. Some of Maine's private schools are Bates, Bowdoin, and Colby colleges.

Economy

Maine's natural resources are important to its economy. The forests provide trees that are harvested for wood and paper products. Its land produces potatoes, dairy products, and blueberries. From the Atlantic, the state's fishermen catch lobsters and other seafood.

Tourism also contributes to the state's income. The hotels, restaurants, and businesses that cater to tourists are part of Maine's service industry. Other significant service areas are trade, government, real estate, and health care.

History

In 1603 Maine became a part of the French province of Acadia. During the 1600s the British also established and maintained scattered settlements throughout the region. The area was a constant battleground, however, until the British conquered the French in eastern Canada in 1763.

Maine was governed as a district of Massachusetts from 1652 until it entered the Union in 1820 as the 23rd state. For many years the United States and Canada disagreed over the state's northern boundary. An 1842 treaty finally resolved the dispute.

Maine's economy grew steadily from 1830 to 1860, but the American Civil War (1861–65) took workers away from the state. In the first half of the 1900s shipbuilding became a major industry in Bath and Portland. Many ships were needed during World War I and World War II.

Overall, development of the state has often been slow. This is partly because many people wish to preserve the natural beauty of the state. Maine's population has grown slowly as well.

Malaria

Malaria is a serious disease spread by mosquitoes. It affects people in tropical parts of the world. Most people who get malaria recover. Still, at least 1 million people die from malaria each year. Most of them are children in Africa.

Malaria is caused by tiny living things called protozoans. Mosquitoes carry the

protozoans. When an infected mosquito bites a person, the protozoans enter the person's blood. They live inside red blood cells as parasites. They take everything they need to live from the cells, which kills the cells.

The symptoms, or signs, of malaria usually begin between one week and one month after the mosquito bite. They include high fever, chills, and headache. A condition called anemia is another common effect of malaria. A person with anemia does not have enough red blood cells. This may cause pale skin, weakness, and dizziness. Malaria can also affect the organ called the spleen, which filters the blood. It can cause the spleen to grow too large.

Malaria can be prevented by keeping down the number of mosquitoes in tropical areas. People can also take medicines that fight the disease.

► More to explore

Disease, Human • Mosquito • Parasite
• Protozoan

In places where malaria is common, people can use nets over their beds to prevent mosquitoes from biting them and spreading the disease.

Did You Know?

The bark of the cinchona tree contains quinine. It has been used to treat malaria since the 1600s.

Malawi

The country of Malawi is located in southeastern Africa. It lies west of Lake Nyasa, one of the deepest lakes in the world. Before the country gained independence it was called Nyasaland. The capital of Malawi is Lilongwe.

Malawi shares borders with Tanzania, Mozambique, and Zambia. Mountains and plateaus, or high, flat areas, cover much of the country. A deep valley called the Great Rift Valley runs along Malawi's eastern border. The valley contains Lake Nyasa.

Grasses cover the dry, low areas. Some trees grow on the plateaus. Evergreen forests grow in the wettest highlands. Malawi's animals include antelope, buffalo, elephants, leopards, lions, rhinoceroses, and zebras.

Malawi's ethnic groups include the Chewa, Nyanja, Tumbuka, Tonga, Lomwe, Yao, and Ngoni peoples. Most

Homes are clustered along the shore of Lake Nyasa, which is also called Lake Malawi.

people speak the Chichewa language. English and other African languages are also common. More than half of the people are Christians. Many others follow Islam or traditional African religions. Most people live in rural areas.

Malawi's economy is based on farming. Important crops include tobacco, sugarcane, tea, peanuts, cotton, and coffee. Manufacturers make mainly food products, beverages, and clothing.

Humans have lived in what is now Malawi for more than 10,000 years. In the 1400s Bantu-speaking peoples founded a kingdom known as the Maravi Confederacy. Great Britain took over the area in the 1880s and 1890s. Malawi won independence in 1964. Malawi's first president ruled until 1994, when the country held democratic elections.

Malaysia

The country of Malaysia is a part of Southeast Asia. Malaysia consists of two areas of land that are about 400 miles (650 kilometers) apart. Kuala Lumpur is the capital and largest city.

Geography

The South China Sea separates the two parts of Malaysia, West Malaysia and East Malaysia. West Malaysia is on the continent of Asia. It borders Thailand to the north. The island country of Singapore lies to the south. The island of Sumatra, which is part of the country of Indonesia, lies to the southwest. Mountain ranges run from north to south in West Malaysia.

East Malaysia sits on the northern part of the island of Borneo. Mountains separate East Malaysia from the Indonesian province of Kalimantan, which takes up the southern part of the island. East Malaysia surrounds the kingdom of Brunei, which lies on the northern coast.

Malaysia is hot and humid year-round. All parts of the country receive plenty of rain.

Plants and Animals

Rain forests cover more than half of the country. The forests contain at least 2,500 kinds of trees and 800 types of orchids.

Malaysia's animal life includes elephants, tigers, leopards, wild oxen,

small bears, wild pigs, orangutans, monkeys, deer, and some rhinoceroses.

Crocodiles, lizards, turtles, and many birds also live in the country.

People

More than half of Malaysia's people are Malays. Most of them follow Islam and speak Malay. There are also more than 25 groups of other native peoples. They mostly follow traditional religions. About a quarter of Malaysia's people are Chinese. Most of them are Buddhists. Indians and other South Asians form a smaller group. They follow Hinduism or Islam. Many of them speak Tamil.

Most of the country's people live in West Malaysia. More than half of the population lives in cities.

Economy

Industry and international trade are important parts of Malaysia's economy.

© 2006 Encyclopædia Britannica, Inc.

Muslim girls in Malaysia usually wear veils. Wearing veils or head scarves is a common practice among women who follow the religion of Islam.

Manufacturers make electronics, chemicals, metals, machinery, and clothing. Malaysia also produces many raw materials that it sells to other countries. It is the world's largest producer of palm oil and a major producer of natural rubber and tin. In addition, Malaysia has good supplies of oil and natural gas.

Agriculture is also important to the economy. Rice is the main food crop. Other crops include cocoa, pepper, coconuts, and bananas. The sea provides a large supply of fish. The rain forests are a source of wood.

History

Human bones and tools found in East Malaysia date back about 40,000 years. People have lived in West Malaysia for at least 6,000 to 8,000 years.

In the AD 100s or 200s small kingdoms developed in West Malaysia. Travelers from India brought Hinduism and Buddhism to the region. Indian and Arab

traders later brought Islam. Islam spread widely from the 1200s to the 1600s.

After about 1400 an important spice trade grew at the port of Melaka, in West Malaysia. The Portuguese captured Melaka in 1511. In 1641 the Dutch took over. The British gained Melaka from the Dutch in 1824.

In the early 1900s several British colonies occupied the territory that is now Malaysia. Japan took them over during World War II (1939–45). Great Britain got them back after the war ended. In 1963 these colonies and Singapore formed the independent Federation of Malaysia. Singapore left the federation in 1965.

As an independent country, Malaysia faced problems between its many groups of people. Many Malaysians also disagreed with the government. Nevertheless, Malaysia built a strong economy.

Malcolm X

Malcolm X

Malcolm X was an African American religious and political leader in the 1950s and 1960s. His proud stand won him many followers but also made him many enemies.

Early Life

Malcolm X was born on May 19, 1925, in Omaha, Nebraska. His name at first was Malcolm Little. His father was a minister. The Little family moved to Lansing, Michigan, in 1929. Malcolm's father was killed in 1931, and Malcolm had a difficult childhood. He dropped out of school after the eighth grade. As a young man he moved to New York City and became involved in crime.

Nation of Islam

Little was in prison when he learned of a group called the Nation of Islam. The Nation of Islam followed some of the

teachings of Islam. It also taught that blacks were superior to whites.

Little joined the Nation of Islam in 1952. He gave up his last name because he believed that slaveholders had given it to his ancestors. He replaced it with an X. The X stood for his unknown African family name.

Malcolm X was a gifted speaker. He won many new members for the Nation of Islam. At the time, the civil rights movement was beginning in the United States. Its leaders sought equal rights for blacks. For example, they wanted black children to be able to attend the same schools as white children. Malcolm X did not agree with the ideas of the civil rights movement. Instead he wanted to establish a separate black nation. He did not rule out violent methods.

Last Years

Malcolm X left the Nation of Islam in 1964. He converted to traditional Islam and took the name el-Hajj Malik el-Shabazz. He made a pilgrimage, or religious journey, to Mecca, Saudi Arabia. He changed his views about whites.

Malcolm X's new beliefs angered some people. On February 21, 1965, he was speaking in New York City when he was shot and killed. Three members of the Nation of Islam were convicted of his murder.

Maldives

The Republic of Maldives is a chain of about 1,200 small islands in the Indian Ocean. People live on only about 200 of the islands. Male is the capital.

Maldives lies southwest of India. The islands extend more than 475 miles (764 kilometers) from north to south and 80 miles (130 kilometers) from east to west. Maldives has a hot, humid climate.

Maldives' islands are made of coral. The coral sits on the peaks of old underwater volcanoes. Some islands are still being formed. Others are being washed away.

Lots of plants, including coconut palms and breadfruit trees, cover the islands. Many fish and sea turtles live in the waters around the islands.

The people of Maldives have a mixture of Indian, Sri Lankan, and Arab roots. They speak the Divehi language. Nearly everyone is Muslim. Most of the people

Maldives is a group of islands located to the southwest of India in the Indian Ocean.

live in villages on small islands. The population includes many people from other countries who work in Maldives.

Tourism and fishing are the most important parts of Maldives' economy. Workers also build boats, repair boats, and make clothing. A small number of people grow fruits and vegetables.

People from southern Asia came to Maldives more than 2,000 years ago. By the AD 1600s the Dutch controlled the islands. The British took over in 1796.

In 1965 Maldives won full independence from Great Britain. In 2004 a huge wave called a tsunami destroyed some of the islands and killed many people.

Malecite

The Malecite were a group of Native American people who lived in what are now Canada and the U.S. state of Maine. They were members of the Abnaki, a larger group of Native Americans who spoke the language called Algonquian.

The Malecite grew corn and hunted and fished for food. They used bark and wood to make tools and weapons. Two chiefs and representatives of each family governed the Malecite.

Europeans began to settle on Malecite land in the 1600s. The Malecite traded with French settlers, and eventually some Malecite people married French people. The French and the English often fought over land in North America. The Malecite sided with the French against the English.

Later the English took over Malecite land. By the middle of the 1800s, the Malecite controlled little land. Today, descendants of the Malecite live in the Canadian provinces of New Brunswick and Quebec and in Maine.

Mali

Mali is a large country in northwestern Africa. Bamako is its capital.

Mali borders Senegal, Mauritania, Algeria, Niger, Burkina Faso, Côte d'Ivoire, and Guinea. Northern Mali lies within the Sahara Desert. The Niger River runs through the south. The land is mostly flat. Most of Mali is hot and dry.

Grasses and mahogany, kapok, and baobab trees grow in the south. The dry north has few plants. Many monkeys, snakes, and birds live in Mali. Other animals include hippopotamuses, lions, hyenas, gazelles, giraffes, and elephants.

Mali has a mixture of many different peoples. Peoples who settle in one place include the Bambara, the Senufo, the Soninke, the Malinke, and the Songhai. The Fulani, the Tuareg, and the Moors often move around in search of water and food for their animals. French is the main language, but people also speak

Women build a house in Mali.

local languages. Most of the population is Muslim.

Mali's economy depends on agriculture. Farmers grow millet, rice, sorghum, cotton, corn, sugarcane, and peanuts. People also raise livestock and go fishing.

As early as AD 300 people traded gold and slaves across the western Sahara. The Ghana, Mali, and Songhai empires ruled the region in turn.

In 1591 Moroccans, or Moors, defeated the Songhai. France took over in the late 1800s. Mali gained independence in 1960. The military ruled the country for many years. Mali finally held free elections in 1992.

Mali Empire

The great empire known as Mali thrived in West Africa from the 1200s to the 1500s. It grew from a small kingdom called Kangaba on the Niger River to a vast area that included some of the most important trading regions of the time. Trading and gold mining made Mali rich.

Mali was a kingdom of the Malinke people. The founder was named Sundiata. He took control of Kangaba in about 1230. He then started to take over surrounding lands that had valuable minerals such as gold and salt. His empire grew rapidly.

The most famous Mali emperor was Musa. Musa was a Muslim, even though many of his people worshipped traditional gods. His grand pilgrimage (religious trip) in 1324 to the holy city of Mecca made Mali famous. It was said that he brought with him 60,000 richly

An illustrated map from the 1300s shows the Mali emperor Musa (lower right) seated on his throne.

dressed followers and slaves. It was also said that each one of the 80 camels in his caravan carried 300 pounds (135 kilograms) of gold.

Musa added the trading cities of Timbuktu and Gao to his empire. He ordered many buildings to be built in these cities and other places. Some of these buildings were mosques, or Muslim places of worship, including the Great Mosque in Timbuktu. Musa also supported artists and scholars.

The empire began to decline in the 1400s. Some of the cities rebelled against their Mali rulers, and others were attacked by neighboring people. By 1550 Mali had lost most of its power. The name Mali lives on today in the modern country of Mali.

Malta

Malta is a small island country in the Mediterranean Sea. Its capital is Valletta.

Geography

Malta lies just south of Sicily, an island belonging to Italy. The country consists of five islands: Malta, Gozo, Comino, Kemmunnett (Comminotto), and Filfla. Malta is the largest island. The islands are mostly low and rocky.

Plants and Animals

Malta's islands have few wild plants. Animals in Malta include hedgehogs, weasels, shrews, and bats.

People

The people of Malta have a mixture of Italian, Arab, English, and other roots. Almost everyone is Roman Catholic. English and Maltese are the main languages. The Maltese language is a form of Arabic, but it is written in the Latin alphabet (the alphabet used for English).

Valletta, the capital of Malta, is located on the northeastern coast of the main island.

Economy

Tourism is Malta's major industry. Ship repair and other services are also important. Factories make electronics, clothing, and plastic products. Small farms grow vegetables, wheat, and fruits.

History

People have lived on the Maltese islands for more than 5,000 years. Invaders from Carthage, a city in North Africa, arrived in Malta by the 500s BC. The ancient Romans took over the islands in 218 BC. Arabs, Normans, and Roman Catholic knights later ruled Malta. The knights built many palaces and military forts. Great Britain won control by 1814. Malta gained independence in 1964.

Mammal

A mammal is an animal that breathes air, has a backbone, and grows hair at some point during its life. In addition, all female mammals have glands that can produce milk to feed their young. Mammals are among the most intelligent of all living creatures. They have an ability to learn that no other type of animal can match.

Mammals include a wide variety of animals, from cats to humans to whales. There are about 5,000 species, or kinds, of living mammal. More than half of all mammals are rodents, a group that includes mice and squirrels.

A polar bear mother feeds milk to her two cubs. Mammals are the only animals that nurse their young.

Although dolphins look like fish and live in the water, they are actually mammals.

Where Mammals Live

Mammals are found in every major habitat around the world. Most mammals live on land—on the ground, in trees, or even underground. Some mammals—including otters, beavers, and seals—live on land and in the water. Whales, dolphins, and manatees are mammals that spend their whole life in water.

Physical Features

Mammals range in size from a tiny bat to a huge whale. The Philippine bamboo bat weighs only about 0.05 ounce (1.5 grams). The blue whale is the largest animal on Earth. It may be more than 100 feet (30 meters) long and may weigh 200 tons (180,000 kilograms).

Bats and whales are unusual mammals, however. Most mammals have four legs for moving around on land. But bats have two wings for flying and two hind legs for grasping. Whales have two flippers and a tail for swimming.

Mammals are the only animals that nurse their young with milk that they produce. The female has special glands called mammary glands. After childbirth, the mother's glands produce milk. The mother feeds the young with this milk until the young are old enough to get food for themselves.

All mammals have hair at some stage of development. Many whales have hair only before they are born. But other mammals have thick coats. Hair helps to keep the body warm. The color and pattern of the hair also may help a mammal to blend in with its surroundings. This may keep a mammal hidden from its enemies. In some mammals, hair takes a special form. The hair of porcupines is hardened into sharp spines. A cat's whiskers are special hairs that are highly sensitive to touch.

Highland cattle have long coats of hair. All mammals grow hair at some point in their development.

Mammals are warm-blooded. This means that they are able to keep their body at roughly the same temperature no matter what the surrounding temperature is. This allows mammals to live in a wide range of climates.

Finally, mammals have a highly developed brain. The mammal brain is the most complex organ known. This complex brain allows mammals to learn from experience and adapt, or change, their behavior.

Behavior

Young mammals learn many behaviors—for example, how to hunt—from their parents. Some young mammals go off on their own once they have grown up. Others stay within their family groups for life.

Individual mammals or groups may live in areas called territories. These mammals may fight off other mammals of the same species that try to enter their territory. Some groups of mammals migrate, or move between places during different seasons.

Some mammals, including ground squirrels and hedgehogs, hibernate during winter. Hibernation is a very deep form of sleep during which an animal's body temperature drops.

Mammals eat a wide variety of foods. Mammals that eat other animals are called carnivores. Cats, dogs, weasels, walrus, and many other mammals are carnivores. Mammals that eat plants—such as lemmings, deer, cattle, and

elephants—are called herbivores. Mammals that eat both animals and plants are called omnivores. Omnivores include raccoons, bears, and primates.

Reproduction

Some mammals, including humans, are born helpless. Other mammals have babies that can walk within hours after birth.

Mammals reproduce through mating. In nearly all mammals, the female carries the developing young in her body after mating. The young develop inside a part of the mother's body called the uterus, or womb. They receive nutrition through the mother's body.

Gestation, or the length of time that the mother carries the young in the womb, varies between species. Pregnancies in hamsters last about two weeks. Elephants may be pregnant for up to 22 months. Human pregnancies last about nine months.

Nearly all female mammals give birth to live young. At birth, the young of some mammals are well developed and able to move about at once. For example, newborn horses and camels can walk within hours after birth. In other mammals—including rabbits and most rodents—the young are born mostly developed but blind, hairless, and helpless.

Marsupials are a group of mammals that give birth to underdeveloped young. Marsupials have short pregnancies of about six weeks. After birth, the young marsupial crawls into a pouch or fold on the mother's belly. The young stays there for several months. It feeds on the mother's milk until it is fully developed. Marsupials include kangaroos, koalas, opossums, and others.

The platypus and echidnas are the only mammals that lay eggs. After the young hatch, they drink milk from their mother, just as other mammals do.

Humans and Other Mammals

Humans have long depended on other mammals for meat and milk. They also have used mammals' skins and hair for clothing and other products. In addition, people have domesticated, or tamed, many mammals. Tamed horses and other animals have provided transportation and have helped in farm work. Tamed cats and dogs have provided companionship.

However, today many mammals compete with humans for food or space. As a result, many species of mammals have died out or exist only in zoos. Other

Manatee

Manatees are slow-moving mammals that are shaped like seals. From a distance they can look like a person who is swimming. For this reason manatees may have inspired people to create stories about mermaids. Mermaids are mythical creatures that are part human and part fish.

Manatees live in rivers and shallow, coastal waters. There are three species, or types, of manatee. The Amazonian manatee lives in the Amazon River and other freshwater in South America. The African manatee lives in tropical West Africa. The Caribbean manatee is found in Florida and the West Indies.

Adult manatees may reach a length of 15 feet (4.6 meters) and a weight of 3,650 pounds (1,660 kilograms). They use their flat, rounded tails to move forward. Like all mammals, manatees have lungs. In order to breathe, they must swim to the water's surface for air. Manatees are herbivorous, meaning that they eat

A young manatee (left) swims with an adult female manatee.

plants. They use their flippers to push the food toward their mouths.

Manatees live alone or in small family groups. Females give birth to one calf, or baby, every two to three years.

All three types of manatee are declining in number. In some cases, the water where they live has become polluted. Many manatees have also been hurt or killed by boat propellers. Most areas now have laws protecting manatees.

Mandan

The Mandan are Native Americans who traditionally lived along the Missouri River in what is now North Dakota. Today most Mandan live on a North Dakota reservation with the Arikara and Hidatsa peoples.

The Mandan traditionally lived in dome-shaped, earth-covered homes called lodges. These lodges were large enough to house as many as 50 people. The Mandan grew corn, beans, squash,

The Mandan lived in earth homes called lodges.

and pumpkins. They also fished and hunted for food.

In the early 1700s French explorers arrived in Mandan lands. The Mandan welcomed the settlers who followed. The tribe became wealthy by trading with them. But many Mandan fell ill with deadly diseases brought by the settlers, such as smallpox and cholera. In 1837 an outbreak of smallpox killed all but about 100–150 of the Mandan.

The surviving Mandan went to live with the Hidatsa on the Fort Berthold Reservation in what is now North Dakota. The Arikara people joined them later. In 1934 the tribes of Fort Berthold became known as the Three Affiliated Tribes. At the end of the 20th century there were fewer than 500 Mandan. Most lived on the reservation.

Mandela, Nelson

Nelson Mandela spent almost 30 years in prison for fighting against apartheid in South Africa. Apartheid was a government policy that separated people of different races. After being freed from prison, Mandela became South Africa's first black president.

Nelson Rolihlahla Mandela was born on July 18, 1918, in Umtata, South Africa. He graduated from the University of South Africa in 1941. Then he studied law and became a lawyer.

Nelson Mandela

Mandela wanted equal rights for South Africa's black people. Although blacks made up most of the country's population, whites controlled the government. Blacks had few rights under apartheid. In 1944 Mandela joined a group called the African National Congress (ANC). The ANC was leading the fight against apartheid. In 1949 Mandela became a leader of the ANC.

Mandela's work got him in trouble with South Africa's government. In 1962 the government put him in prison. Mandela became famous during his years in prison. South Africa's blacks worked to free him. So did people in other countries who opposed apartheid.

In 1990 South African President F.W. de Klerk finally freed Mandela. The next year Mandela became president of the ANC. Mandela and de Klerk worked together to end apartheid. They wanted to make South Africa a democracy in

which all the people could take part. In 1993 the two men were awarded the Nobel peace prize.

South Africans of all races voted in an election in 1994. Mandela was elected president. He improved housing, education, and living standards for blacks. Mandela stepped down as head of the ANC in 1997. He retired from politics in 1999 after one term as president.

Mango

A mango is the fruit of a tree that grows in warm parts of the world. The mango tree is a member of the sumac, or cashew, family. Its scientific name is *Mangifera indica*.

The mango tree first grew in India and parts of eastern Asia. Today people grow the tree in the Americas and Africa as well.

Mangoes are widely grown in tropical areas of the world.

Did You Know?

The mango tree is an ever-green tree of the cashew family.

The mango tree may grow to 60 feet (18 meters) tall. The fruits develop from small, pinkish flowers. The smallest mangoes are the size of a plum. The largest mangoes weigh as much as 5 pounds (2.3 kilograms). Mangoes may be round, oval, kidney-shaped, or heart-shaped. Their smooth, thin skin may be green, red, yellow, purple, or a combination of these colors. Their juicy flesh is yellow-orange. They have one large pit, or seed, inside.

Mangoes are a major source of food in India, the West Indies, and other places. People eat mangoes fresh and in main dishes and desserts. People also use mangoes to make sauces called chutneys. Mangoes are rich in vitamins A, C, and D.

Mangrove

Mangroves are trees or bushes that grow in thick clusters along seashores and riverbanks. They have a thick tangle of roots that sticks up through the mud. These roots help to keep waves from washing away the dirt and sand of the coastline.

There are more than 60 species, or types, of mangrove. They are found in and near the tropical parts of Asia, Africa, Australia, and the Americas.

Mangroves can grow in places where very few other trees can. They can grow in salty water because they are able to

Mangroves have tangled roots that are partly aboveground.

filter out the salt from the water they need. They can stand in soft, wet soil because of their strong roots. Plus, unlike other trees, mangroves do not have to struggle to get air from wet soil. Instead, they take oxygen through holes in their aboveground roots.

Mangroves can be short bushes, or they grow to about 130 feet (40 meters) tall. The common mangrove reaches a height of about 30 feet (9 meters). A mangrove's leaves are typically green and may be fuzzy or waxy. The flowers can be yellow or white.

Mangroves have hard wood that people use to make boats and other products. The bark of the common mangrove is full of tannin. Tannin is a chemical used for turning animal hides into leather. The fruit of some mangroves can be eaten. Also, mangrove leaves, roots, and bark have been used in medicine.

Manila

Population
(2007 estimate)
1,660,714

Manila is the capital of the Philippines, an island country in Southeast Asia. It has been the country's main city for about 400 years. It lies on Manila Bay, on Luzon Island. The Pasig River runs through the middle of the city.

A flowering plant called nilad once grew all over the banks of the Pasig River. The city was named Maynilad after this plant. Its name was later shortened to Manila.

Manila is the Philippines' center of business, trade, and industry. It is also the country's main port. Factories in the city

make fabrics, clothes, processed foods, medicines, and many other products.

In the 1500s Manila was a Muslim settlement. Spanish conquerors destroyed the settlement in 1571 and built a new town there. It became the capital of the Spanish colony of the Philippines. Spain ruled the colony for more than 300 years.

U.S. forces captured Manila during the Spanish-American War of 1898. After the war the United States took control of the whole country. It made Manila its headquarters in the Philippines. The city became a center of trade and tourism.

During World War II (1939–45) the Japanese captured Manila. U.S. forces recaptured the city in 1945. Manila was damaged during the fighting but was later rebuilt. In 1946 the Philippines became an independent country with Manila as its capital.

Philippines

Manila is a busy, modern city.

Manitoba

Manitoba is one of Canada's three Prairie Provinces. Manitoba is also called the Keystone Province because it is centrally located within Canada, like the keystone in an arch. Its capital is Winnipeg.

Geography

On the west, Manitoba borders Saskatchewan, another of the Prairie Provinces. (Alberta is the third Prairie Province.) Nunavut lies to the north, and the cold waters of Hudson Bay are to the northeast. To the east is Ontario. To the south are the U.S. states of Minnesota and North Dakota.

Flat prairies with rich soils cover much of southern Manitoba. Most of the rest

of the province is rocky land with many forests and rivers. The land near Hudson Bay in the far north is treeless tundra. Manitoba has more than 38,000 lakes. The three largest—Lakes Winnipeg, Manitoba, and Winnipegosis—are in the south.

People

Manitoba has more ethnic groups than any other Canadian province. More than half of its people have ancestors who came from Great Britain or Ireland. People of German, Ukrainian, French, and Polish ancestry also make up large segments of the population. More than 100,000 people have American Indian roots. Most of them are Chipewyan, Assiniboin, Cree, or Ojibwa. The Métis people have both American Indian and European (mostly French) ancestry.

Winnipeg and its suburbs are home to about 60 percent of Manitoba's people. Winnipeg is the largest city in central Canada.

Economy

Manitoba's location in central Canada has made transportation and shipping important to its economy. Lying 60 miles (95 kilometers) north of the U.S. border, Winnipeg is a key linking point for air, railroad, and truck routes. Products made in Manitoba are shipped in all directions. They include foods and drinks, airplane parts, buses, computers, clothing, and paper. Mines in the north produce copper, zinc, nickel, and gold.

About 20,000 farms, mostly on the southern prairies, contribute to Manitoba's economy. Wheat, canola, alfalfa, barley, oats, and flax are the most important crops. Farmers also raise hogs and cattle.

History

The first residents of Manitoba were American Indians who arrived thousands of years ago. European explorers came in the early 1600s. They found that the area was rich in fur-bearing animals. In 1670 the English government created the Hudson's Bay Company to build fur-trading posts in the area. The company faced fierce competition from French fur traders. After the English drove the French from Canada in 1763, the Hudson's Bay Company controlled the whole area.

The Hudson's Bay Company soon had another competitor, a Canadian fur-trading company called the North West Company. In 1811 the Hudson's Bay Company started the first farming colony in Manitoba along the Red River, near what is now Winnipeg. The North

A young polar bear makes its way across ice on Hudson Bay in northern Manitoba.

West Company attacked the colony, but it survived. In 1821 the North West Company became part of the Hudson's Bay Company.

In 1869 the Hudson's Bay Company turned its territory over to the new country of Canada. The Métis who lived in the area feared that the Canadians would take their land and change their way of life. Led by Louis Riel, the Métis rebelled. The Canadian government defeated the rebels, but Riel won rights for his people.

Canada made Manitoba a province in 1870. Manitoba grew slowly at first, but in the early 1900s many immigrants arrived from eastern Canada and Europe. Many of the early settlers were farmers, but mining and manufacturing soon developed. Later in the 1900s Manitoba's government worked to expand the economy in the north.

Manufacturing

Manufacturing is the process of making products, or goods. The businesses that make products are called manufacturers. Manufacturers sell their products to people and companies.

Making Products

Manufacturers take raw materials and turn them into products to sell. Raw materials include wood, steel, cloth, and many other materials. Using raw materials, manufacturers make cars, electronics, clothing, furniture, home appliances, machinery, ships, airplanes, and many other goods.

Manufacturers have many different ways of making goods and doing business. They usually use machines to make large amounts of products. Human workers or computers may operate these

Assembly lines are a common sight in factories. Each worker or machine on an assembly line does a certain task over and over again to put products together quickly.

machines. Some manufacturers sell their products to the public. Others sell their products to other companies.

Different companies may work together to create a single product. For example, a shoe manufacturer may not have the equipment to make shoelaces. Or it may not want to take the time to make them. So it buys the shoelaces for its shoes from a shoelace manufacturer.

History

Until about 200 years ago people made most goods either at home or in small workshops. They made products one at a time, by hand. During the 1800s the Industrial Revolution changed how goods were made. Newly invented machines could do jobs that people had to do before. Manufacturers started to build factories to replace small workshops. Factories could make thousands of products quickly and cheaply. This caused the prices of products to fall. People could now buy more types of goods.

However, large numbers of people worked for very long hours in unpleasant, often dangerous, factories. They made little money. Workers soon formed labor movements to demand better working conditions. Today factories in many countries are safer. Workers work fewer hours and get better pay. They also receive benefits such as health insurance and paid vacation time.

Maori

The Maori were the first people to live on the islands of New Zealand. They arrived on the islands about 1,200 years ago. Their name means “ordinary people.”

The earliest Maori are sometimes called the Moa Hunters. Their main source of food was the moa, a huge flightless bird that is now extinct. After the moas were gone, the Maori ate smaller birds. They also caught fish and grew crops for food.

The Maori were skilled artists. They carved wooden war canoes big enough to hold 100 people. They also excelled in weaving.

According to Maori history, the Maori sailed to New Zealand from a tropical island called Hawaiki. This history says that a “great fleet” of canoes arrived in New Zealand in the 1300s. But experts believe the Maori reached the islands much earlier, by 800. Those experts believe that “Hawaiki” was actually Tahiti.

Dutch explorers arrived in New Zealand in 1642. The Maori fought them and chased them away. Later the Maori welcomed European settlers. In 1840 the Maori accepted British rule. Soon, though, the Maori and the British began fighting over land. The Maori lost much of their land in the wars.

Today the Maori make up about 10 percent of New Zealand’s population.

A Maori man greets a tourist using the traditional Maori form of welcome.

Most Maori live in cities among New Zealanders of European ancestry. Many Maori have kept alive their language and traditional culture. They also have worked to regain control of their traditional lands.

Mao Zedong

Mao Zedong ruled China from 1949 until 1976. He also led China’s Communist Party. Mao brought major changes to China. Some of these changes led to periods of great disorder in the country.

Early Life

Mao was born on December 26, 1893, in the village of Shaoshan in southeastern China. His parents were farmers. In 1911 Mao fought in a revolution against China’s rulers. The revolution forced China’s last emperor from power.

Mao Zedong

While studying at Beijing University, Mao became interested in Communism. Communists wanted all people to own everything together. Mao came to believe that China should have a Communist government. In 1921 he joined the Chinese Communist Party.

Rise to Power

In the early 1920s the Communists worked together with another party, the Nationalists. In 1926, however, a new Nationalist leader named Chiang Kai-shek turned against the Communists. Mao fought back.

Mao set up a Communist base in south-eastern China. The Nationalists attacked it. Mao then led his forces, called the Red Army, on a journey called the Long March. In 1935 they arrived at a new base in the northwest.

In 1937 the Communists and the Nationalists joined forces to fight the Japanese, who had invaded China. The Japanese were defeated in 1945. Then Mao's forces again fought the Nationalists. The Communists won in 1949. Mao formed the People's Republic of China and became its chairman (leader).

Chairman Mao

Mao tried to transform China's economy. In 1958 he started a program called the Great Leap Forward. Among other changes, he made peasants work on huge farms called communes. The program failed. Farm production went down so much that 20 million people starved to death.

In 1966 Mao began a movement called the Cultural Revolution. His goal was to strengthen the Communists' hold on China. Mao shut down the schools and formed groups of young people called Red Guards. The Red Guards attacked people who disagreed with the government. They also destroyed much property.

The Cultural Revolution weakened China. Even so, it continued as long as Mao lived. He died in Beijing on September 9, 1976.

Map and Globe

A map is a drawing of all or part of Earth's surface. Its basic purpose is to

People can learn about geography by studying a globe.

show where things are. Maps may show visible features, such as rivers and lakes, forests, buildings, and roads. They may also show things that cannot be seen, such as boundaries and temperatures. Most maps are drawn on a flat surface. A map displayed on a round surface is called a globe.

Types of Maps and Globes

The most familiar kinds of maps are topographic and political maps. Topographic maps show the location and shape of features on Earth's surface. These often include natural features, such as mountains and lakes. They can also include things that humans have built, such as roads, bridges, tunnels, and railroads. Political maps show the boundaries of countries, states, provinces, counties, and cities. Most maps combine features of both topographic and political maps.

Globes provide the same kinds of information that flat maps do. Because Earth is almost round, a globe represents it best. A globe shows Earth as it looks when seen from outer space.

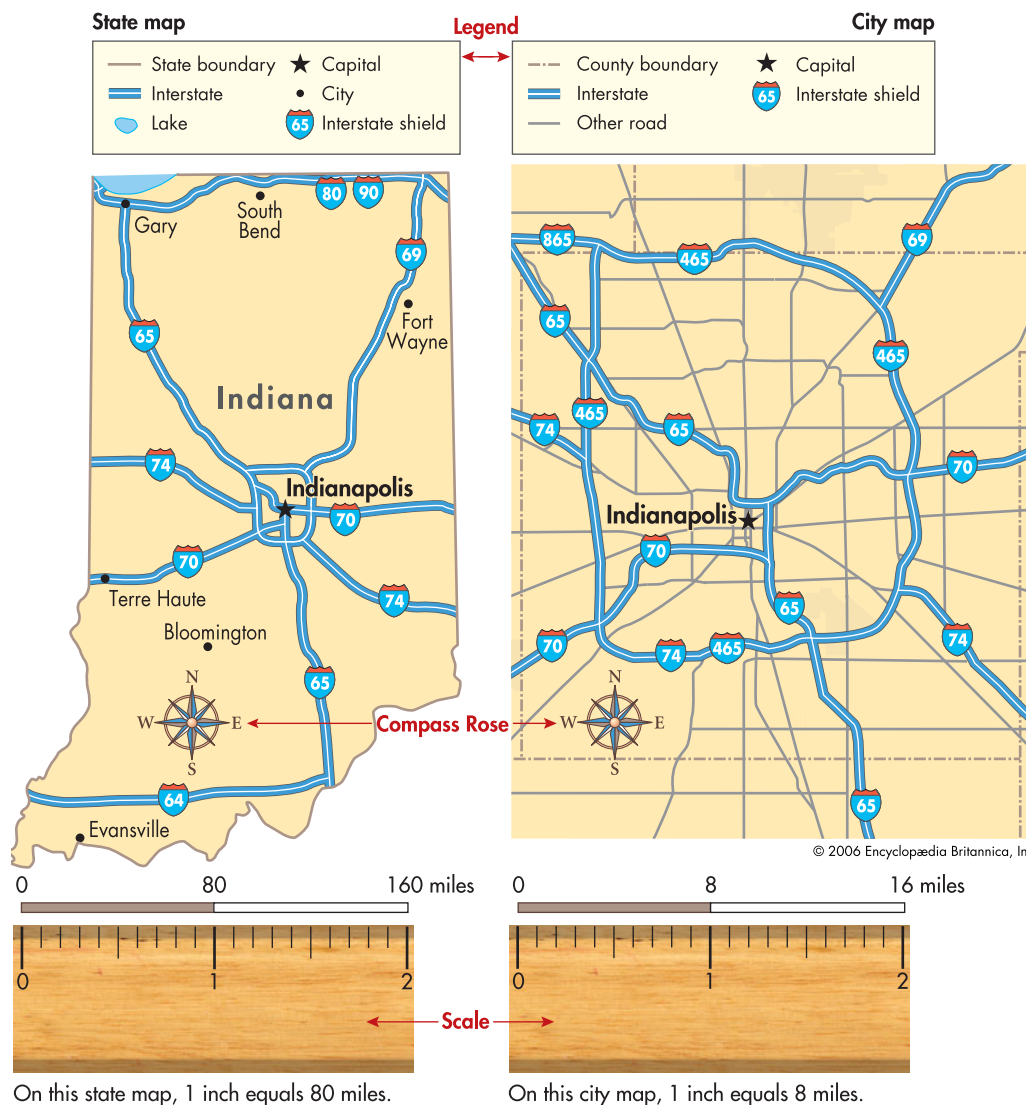

Scale

A map is always smaller than the area it represents. Most maps include something called a scale to show how much smaller the map is. The scale shows how distances on the map are related to the actual distances.

Map scale can be shown in a number of ways. The simplest way is a graphic scale. A graphic scale is a ruled line or bar that is usually marked off in miles or kilometers. Such a scale can be used to measure distances on the map.

Globes can represent planets other than Earth. An astronomer, or person who studies outer space, helped to make a globe of the planet Mars in 1892.

Maps often include a legend, a compass rose, and a scale. The legend is a list of symbols used on the map. The compass rose shows which way is north on the map. The scale shows how distances on the map are related to the actual distances.

Some maps use a mathematical expression called a ratio to describe scale. A ratio is a written way of showing the relationship of two amounts to each other. For example, 1:50,000 is a ratio. If a map has a scale ratio of 1:50,000 it means that one unit on the map is equal to 50,000 of the same units on the ground. If the unit of measurement is a centimeter, then one centimeter on the map equals 50,000 centimeters (500 meters) on the ground.

Finding a Place

Any place on Earth can be located using a system called latitude and longitude. Latitude and longitude are sets of imaginary lines that circle Earth. Lines of latitude run east and west. Lines of longitude run north and south. They are often printed on maps, and they each have a number. Any place can be described by the two numbers that tell where a particular line of longitude crosses a particular line of latitude.

Some maps are divided into sections that are like squares on a checkerboard. Rows across may be lettered “A,” “B,” “C,” and so on. Rows that go up and down may be numbered “1,” “2,” “3,” and so on. These maps often have an index that tells where to find a place by using the letters and numbers. If the index says a place is located at “B 2,” for example, it can be found on the map in the area where the “B” and “2” rows cross.

Map Symbols

In the past mapmakers used drawings to show where things such as castles and mountains were located. The drawings were large so they could be clearly seen.

Over time maps were made more simple. Mapmakers replaced pictures with symbols. Each symbol represents one particular thing. A map may have different symbols for cities, rivers, lakes, roads, railroad tracks, and so on. Mapmakers usually show the most important information using symbols that stand out. For example, a main road may be shown by double black lines with red between them. A legend is a list that describes the symbols used on a map.

History

People began making maps thousands of years ago. The earliest maps showed features that were important to the people in a particular area. The ancient Greeks were the first to show Earth as being round. But their maps only showed the world that was known at the time. Later, as people began to explore

the world, they made maps of where they had been. Today detailed maps show every part of Earth.

Maple

Maples are trees and shrubs that are often planted in parks and along city streets. They are good shade trees because their leaves form a thick dome. In autumn the leaves turn spectacular shades of yellow, orange, and scarlet.

There are about 200 different species, or kinds, of maple. They grow throughout much of North America, Europe, and northeastern Asia.

Maples range from small shrubs to large trees. They can grow to be more than 130 feet (40 meters) tall. The leaves usually have several fingerlike sections called lobes. Flowers appear in early spring. They vary from deep red to greenish yellow. Maples also bear papery wings

Sugar maples have sweet sap that is used to make maple syrup.

Did You Know?

The art and science of making maps is called cartography.

containing seeds. These flutter to the ground, scattering the seeds away from the tree. The seeds can grow into new maples.

Maple syrup and sugar come from the sap of the sugar maple. These trees grow in Canada and the United States. People collect the sap in late winter or early spring. They cut holes into the trunk of the tree and gather the sap in buckets. Then they boil the sap to make it thicker. Sugar maples and some other species also provide wood for building furniture and other products.

Marathon

A marathon is a footrace with a distance of exactly 26 miles and 385 yards (42.2 kilometers). Marathon runners usually

The Boston Marathon includes a division for marathoners in wheelchairs.

do not run on a track. Instead they run over land, including city streets.

The marathon is the longest of all the racing events in the Olympic Games. Many cities throughout the world also host their own marathons. The best-known marathons in the United States are the Boston Marathon and the New York City Marathon.

Both men and women compete in the city and Olympic marathons. The fastest runners complete the race in slightly more than two hours.

The marathon's name comes from a legendary event that happened about 2,500 years ago. Marathon was the name of a plain in ancient Greece. There, in 490 BC, a fierce battle broke out between the Athenians and the Persians, who wanted to rule the city-state of Athens. After defeating the Persians, the Athenians supposedly sent a runner

back to Athens to announce the victory. The distance from Marathon to Athens was about 25 miles (40 kilometers). In 1896 the first modern Olympic Games included a marathon race to honor that ancient Greek runner.

Marconi, Guglielmo

Guglielmo Marconi was an Italian scientist and inventor. He built the first wireless telegraph, which sent messages through the air for the first time. This invention was the starting point for radio.

Marconi was born on April 25, 1874, in Bologna, Italy. At about age 20 he became interested in radio waves. Radio waves are streams of energy that carry electric signals through the air. Marconi thought that radio waves could be used in communication.

Guglielmo Marconi is pictured with his telegraph equipment.

Did You Know?

One of the first uses of Marconi's "wireless telegraphy" was to report the progress of the America's Cup yacht race in 1899.

Marconi experimented with radio waves and the telegraph. The telegraph used at the time could send and receive coded messages in the form of electric signals. However, it needed wires to do so. Marconi created a telegraph that could send electric signals using radio waves. The signals traveled through the air instead of through wires. In 1897 he formed a wireless telegraph business in England. It made him rich.

In 1901 Marconi sent radio signals across the Atlantic Ocean for the first time. Some scientists had thought this could not be done. They believed that radio waves traveled in straight lines. As Earth's surface curved, they said, the waves would go out into space. Marconi believed that the upper level of the atmosphere would reflect the radio waves back to Earth. He was right.

Marconi's wireless telegraph sent messages in the form of coded clicks, like earlier telegraphs did. Then other scientists added their inventions to it. The new devices could also send voices and music.

Marconi was awarded a share of the Nobel prize in physics in 1909. He continued to experiment until his death. He died in Rome, Italy, on July 20, 1937.

Mardi Gras

Mardi Gras is a festive holiday celebrated with feasts and parades. It comes

A Mardi Gras parade in France includes large balloon figures and colorful, decorated floats.

before the Roman Catholic season of Lent. Lent is a period of 40 days that ends with Easter.

The name Mardi Gras is French for "Fat Tuesday." The holiday takes place on the Tuesday before Ash Wednesday, the first day of Lent. Traditionally during Lent, Roman Catholics stopped eating meat, fish, eggs, and other foods. On Mardi Gras, therefore, households consumed all the remaining foods that they would not be allowed to eat during Lent.

The festivities of Mardi Gras can last for many days before the actual holiday. In some countries this period is called carnival. One famous carnival takes place in Rio de Janeiro, Brazil. This festival lasts about 4 days. New Orleans, Louisiana, has the most famous carnival celebration in the United States. Its Mardi Gras festivities begin about 2 weeks before Fat Tuesday.

Easter

Marie-Antoinette

Marie-Antoinette was the wife of the French King Louis XVI. While the common people of France suffered, Queen Marie-Antoinette spent money wildly and thought only of herself. This helped lead to the French Revolution. Marie Antoinette stood for everything that the people of France disliked about the royal family.

Early Life

Marie-Antoinette was born in Vienna, Austria, on November 2, 1755. Her parents were the emperor and empress of the Holy Roman Empire. When she was 14 years old, she married Louis.

Queen of France

Louis and Marie-Antoinette became king and queen in 1774. At the time, France was a feudal society. This means that the aristocracy, or noble class,

owned the land, and the peasants paid to farm the land. The peasants suffered greatly under this system.

By the late 1700s the country was also running out of money. The French had spent a great deal to help the colonists during the American Revolution. Even though the French people were suffering, the king and queen spent large amounts of money to pay for their expensive lifestyle.

The French people finally rose up in protest and began the French Revolution in 1789. Louis and Marie-Antoinette stayed king and queen, but they became afraid. In 1791 they tried to escape France and move to Austria. The people caught them and took them back to Paris. Marie-Antoinette then asked Austria to help stop the revolution. The French people grew even angrier at her.

Last Days

In August 1792 revolutionaries took Louis and Marie-Antoinette prisoner. In September France became a republic—a country ruled by the people. In January 1793 the people put the king to death. They put Marie-Antoinette to death on October 16, 1793.

Did You Know?

According to a famous story, Marie-Antoinette said “Let them eat cake” to someone who told her that the poor people had no bread. The story is probably not true.

Marigold

Marigolds are plants that bear brightly colored blooms. They are popular in flower gardens. People also plant mari-

The French marigold is a bushy plant with bright flowers.

golds among vegetables. Their leaves have a strong scent that can drive away insect pests.

Marigolds are native to southwestern North America, Central America, and South America. There are about 30 different species, or types. They are annual plants, which means that they live for only one year. The most popular varieties include the French and African marigolds.

Marigolds usually grow to a height of about 1 to 5 feet (0.3 to 1.5 meters). Their flowers are usually red, orange, or yellow. There may be just one flower or a few on each stem.

Marigolds grow well in sunny areas. They typically bloom from summer until the first frost.

Marines

Marines are a type of soldier. The first marines were soldiers trained to fight aboard warships. Later marines traveled to enemy lands on ships and then went onshore to fight. Today marine forces are still usually attached to navies, or the armed forces of the sea. But marines may serve on land or in the air as well as at sea.

Marines Today

A number of countries have marine forces. They include Brazil, China, France, Indonesia, Mexico, The Netherlands, and Pakistan. The Royal Marines is the marine force of the United Kingdom. It is a part of the Royal Navy.

The United States Marine Corps is the most famous marine force. The U.S. Marine Corps is within the U.S. Department of the Navy. U.S. Marines have served in all the wars of the United States. They are mainly land and air fighters. But they do use ships to attack coastlines and to carry supplies. U.S.

A Sea Knight helicopter used by U.S. Marines lands on a ship near the Philippines.

Marines also provide protection for certain U.S. government workers in foreign countries. The U.S. Marine Corps' motto is *Semper Fidelis*, which is Latin for "always faithful."

History

The use of marines in wars dates back to ancient times. During the 400s BC well-armed soldiers fought aboard Greek warships. During the 200s and 100s BC some Roman soldiers were specially trained to fight on warships as well.

The Dutch and the English organized the first modern groups of marines during the 1660s. It was at this time that the word marine first came into use. However, as cannons and other large guns were developed, marines did less fighting on ships. Today such fighting rarely, if ever, happens.

Marquette, Jacques

Father Jacques Marquette and Louis Jolliet were the first white men to explore the upper Mississippi River. Marquette's writings told Europeans about the river and its course.

Jacques Marquette was born on June 1, 1637, in Laon, France. He became a Roman Catholic priest as a young man. In 1666 Marquette went as a missionary to New France (now Canada). In 1671 he moved to the north shore of the

Straits of Mackinac (a channel that connects Lake Michigan and Lake Huron). There he founded the Saint Ignace mission.

Louis Jolliet, a young explorer, visited Saint Ignace in December 1672. The governor of New France had sent him to explore the Mississippi River. On May 17, 1673, Marquette, Jolliet, and five

A drawing shows Father Jacques Marquette during his travels.

other men set out from Saint Ignace in two bark canoes. They used the Fox and Wisconsin rivers to get from Lake Michigan to the Mississippi River. Marquette preached to the Native Americans along the way.

At the mouth of the Arkansas River, in what is now Arkansas, they learned from the Native Americans that the Mississippi flowed into the Gulf of Mexico. They went no farther because the land further along was Spanish territory. They turned back, though Marquette went only as far as Green Bay, in what is now Wisconsin. There he wrote a report about the journey.

During the journey, Marquette had fallen ill. In 1674 he traveled to what is now Illinois. He wanted to start a mission among a group of Native Americans. He reached them in the spring of 1675, but there his health grew worse. On May 18, 1675, on the way back to Saint Ignace, he died.

Mars

Mars is one of the planets that orbit, or travel around, the sun in the solar system. It is the fourth planet from the sun. It is also Earth's outer neighbor. Mars travels around the sun at an average distance of about 142 million miles (228 million kilometers). It has two small, rocky moons, Phobos and Deimos.

A picture of Mars taken by the Mars Global Surveyor shows an ice cap at the top of the planet. White clouds made of water and ice are also visible.

For centuries people have wondered whether there is life on Mars. Studies have shown that there are no obvious signs of life on the planet. However, scientists are still trying to find out if very tiny, simple life-forms may have ever existed on Mars.

Physical Features

Mars is the second smallest planet in the solar system, after Mercury. Its diameter, or distance through its center, is about 4,200 miles (6,800 kilometers). That is about half the size of Earth's diameter. Mars has layers like Earth's. These layers consist of a metal core; a thick, rocky middle; and a crust.

The surface of Mars consists of rock and dust. There are many large dust storms. Parts of the planet have many pits called craters. The landscape includes plains, deep valleys, and high mountains.

Did You Know?

Mars was named for the ancient Roman god of war. People saw the planet's red color and thought of anger and blood.

The atmosphere, or layer of gases, surrounding Mars is thin. It does not trap heat well. The temperature at the surface of Mars is about -28°F (-33°C) in the afternoon. But it cools to about -118°F (-83°C) before dawn.

Water is rare in the solar system, except on Earth. Water exists on Mars as ice caps at its north and south poles, or ends, and as patches of ice beneath its surface. Small amounts of water are also found as a gas in the air. Some evidence suggests that in the past Mars had some liquid water on its surface. For example, Mars has hundreds of channels that look like dried-up riverbeds. Some scientists think Mars was once a warm planet with large seas.

Orbit and Spin

Like all planets, Mars has two types of motion: orbit and spin. Mars orbits, or travels around, the sun. It completes one orbit every 687 Earth days. In other words, a year on Mars lasts 687 Earth

days. Mars spins about its center at nearly the same rate as Earth does. Mars takes about 24.6 hours to complete one rotation. So a Mars day lasts about as long as an Earth day.

Observation and Exploration

People have observed Mars since ancient times. Since 1964 many unmanned spacecraft have collected information about the planet. The United States and the Soviet Union each sent several spacecraft to Mars from the 1960s to the 1980s. Some of them flew past Mars or orbited around it. Others, including the U.S. Viking crafts, landed on Mars.

Since the 1990s the United States and Europe have sent several spacecraft to orbit the planet. They include the U.S. Mars Global Surveyor and Odyssey and Europe's Mars Express.

The U.S. spacecraft Pathfinder landed on Mars in the 1990s. It released a robot

Did You Know?

A camera on the spacecraft Pathfinder photographed the rover called Sojourner after the rover was released onto the surface of Mars in 1997.

called a rover onto the surface. They both sent back information about the surface, interior, and atmosphere of Mars. The United States sent two more rovers, called Spirit and Opportunity, to the planet in 2003. The rovers moved around on the surface. They performed experiments and took many photographs.

Marsh

A marsh is a type of wetland with watery mud that is rich in minerals. Marshes

are very similar to swamps. The main difference between them is the type of plant life they support. Marshes have mostly grasses, while swamps have mostly trees.

Marshes form in low-lying areas near rivers and along seacoasts. They can have either fresh or salty water. Marshes are especially common in the areas called deltas. These form at the mouths of rivers. The flow of a river slows down near the mouth. The rock and soil that the river is carrying then settles to the bottom. This material is called sediment. It creates a rich mud in which marsh plants grow.

Grasses, sedges, reeds, and rushes are common marsh plants. Rice grown in marshes provides a major portion of the world's grain. It is the most important

Marshland covers a delta region in Alaska. Marshes often form in deltas, which are areas of land at the mouths of rivers.

kind of marsh plant. Crabs, snails, turtles, and many kinds of fish and birds are some of the animals that are found in marshes.

Marshall, Thurgood

Thurgood Marshall was the first African American to serve as a justice (judge) on the U.S. Supreme Court. Marshall strongly supported equal rights for African Americans.

Marshall was born in Baltimore, Maryland, on July 2, 1908. After attending high school in Baltimore, Marshall graduated with honors from Lincoln University in Pennsylvania. In 1933 he graduated from Howard University Law School in Washington, D.C. He was the best student in his class.

In 1936 Marshall became a lawyer for the National Association for the Advancement of Colored People (NAACP). At that time African Americans did not have the same rights as whites. The NAACP fought in the courts to win equal rights for blacks. In the 1940s and 1950s Marshall argued 32 cases before the Supreme Court. He won 29 of those cases.

Marshall's most important courtroom victory was in the case of *Brown vs. Board of Education of Topeka* in 1954. Before this case, the law allowed states to

Thurgood Marshall

have separate schools for whites and blacks. Marshall convinced the Supreme Court that this practice went against the U.S. Constitution. This ruling helped to end all forms of legalized segregation, or separation, by race.

In 1961 President John F. Kennedy made Marshall a judge. In 1965 President Lyndon B. Johnson made Marshall the U.S. solicitor general. In that job he represented the government in cases before the Supreme Court. Then in 1967 Johnson put Marshall on the Supreme Court.

As a Supreme Court justice, Marshall continued to support equal rights for blacks. He also opposed the death penalty. Marshall retired in 1991. He died in Bethesda, Maryland, on January 24, 1993.

Marshall Islands

The Republic of the Marshall Islands includes 29 atolls and five islands in the central Pacific Ocean. Atolls are reefs, or chains, of coral that surround a lagoon (a shallow area of water). The country's capital is on Majuro Atoll.

Geography

The Marshall Islands are part of the region known as Oceania. They are scattered over about 770,000 square miles (2,000,000 square kilometers). The atolls and islands are made of coral attached to the tops of underwater volcanoes. The land is low and flat. The climate is hot and humid all year.

Plants and Animals

Palms and breadfruit trees are the Marshall Islands' main plants. Many fish, dolphins, octopuses, and turtles live in the surrounding waters.

People

Most of the people are Micronesians. They speak Marshallese. English is also common. Christianity is the main reli-

gion. More than half of the population lives on Majuro and Kwajalein atolls. The rest of the people live in villages on other islands.

Economy

The economy of the Marshall Islands depends on money received from the United States. Many people work at a U.S. missile-testing area on Kwajalein Atoll. Other people in the cities work for the government or in tourism. On the outer islands, fishing and farming are common. Crops include coconuts and breadfruit.

History

Micronesians arrived on the islands more than 2,000 years ago. John Marshall, a British sea captain, explored the area in 1788. The islands were named after him. Germany took control of the islands in 1886, but Japan seized them in 1914.

During World War II (1939–45) the United States took over the islands. The United States used Bikini and Enewetak atolls to test nuclear weapons. The testing badly damaged the atolls.

The Marshall Islands gained independence from the United States in 1986. However, the U.S. military still protects the country.

Marsupial

Marsupials are a group of mammals that are known for carrying their young in a pouch. The name marsupial comes from the Latin word *marsupium*, which means “pouch.” Kangaroos, koalas, and opossums are well-known marsupials.

Marsupials live in forests, lakes and streams, grasslands, and even underground. More than 170 species, or kinds, live in Australia, New Guinea, and nearby islands. About 70 species live in South and Central America. One species, the Virginia opossum, lives in North America.

Most marsupials range in size between a small cat and an average-sized dog. But they can be much larger or smaller. The largest marsupial is the red kangaroo of Australia. It can be 10 feet (3 meters) long from its head to the tip of its tail. The smallest marsupials are the mouse-like planigales. They grow to only about 4 inches (10 centimeters) long.

Marsupials are not fully developed at birth. They are tiny and blind. Right after birth they climb up their mother's belly and begin to drink milk from the mother's nipples. In most species the nipples are in a pouch that the young crawl into. The young stay in the pouch

Marsupials have a wide range of body shapes and sizes.

for weeks or months, drinking the mother's milk. Some marsupials do not have pouches. In these species the young simply cling to the mother's nipples.

After the young stop depending on their mother's milk, they can leave the pouch and look after themselves. But they run back to the pouch when danger threatens. The young of the koala and some other marsupials cling to the mother's fur after they have outgrown the pouch.

Martial Art

Martial arts are fighting skills that people practice for sport or for self-defense. Most of them developed in eastern Asia. The word martial comes from Mars, the ancient Roman god of war. However, most of the martial arts are not violent. Many followers of the religion of Buddhism use martial arts to help achieve spiritual awareness. Other people use martial arts to develop self-

T'ai Chi ch'uan, or T'ai Chi for short, is a slow-moving, graceful type of martial art.

discipline. Martial arts require high levels of both physical and mental training.

Students of the martial arts are commonly ranked according to skill level. They wear colored belts that represent their degree of skill. The darker the color, the higher the rank. The black belt represents the highest skill level.

Martial arts can be divided into armed and unarmed arts. The armed arts use weapons; the unarmed arts do not. In the unarmed arts opponents use their feet and hands to strike or wrestle with each other. In Japan the warriors called samurai were trained in both armed and unarmed arts.

Armed Martial Arts

The armed martial arts historically included archery (shooting arrows with a bow) and fighting with swords or spears. The martial art called ninjutsu used a wide variety of weapons. Ninjutsu is a Japanese word that means "fighting methods of the ninja." The ninja were a secret group of highly trained martial artists. They were spies and fighters for Japanese rulers known as warlords. The ninja used such weapons as blowguns with poisoned darts, brass knuckles, and throwing devices.

In modern times versions of the armed martial arts are practiced as sports. The sport called kendo developed from the fighting methods of the samurai. Opponents in kendo use wooden swords for attack and defense. Kendo means "the way of the sword." Kyudo is a tradi-

tional form of archery that is common in Japan.

Unarmed Martial Arts

Karate is a very popular martial art that started in Japan. The word karate means “empty hand” in Japanese. Karate was probably developed by people who were forbidden to carry weapons. Karate opponents use their arms and legs for punching, kicking, and defending themselves. They try to focus the entire body’s power into the hand, foot, or other body part used for striking. A karate expert can break thick boards with a quick strike from a bare hand or foot.

Tae kwon do is a Korean martial art. The name means “art of kicking and punching.” Tae kwon do blends karate and an earlier form of Korean self-defense. It includes standing kicks, jump kicks, and punches.

Judo is another Japanese martial art. Judo opponents usually do not attack each other directly. Instead they try to turn their opponent’s power to their own advantage. They use quick moves to try to make each other fall. This is called throwing the opponent. They also try to pin each other to the ground. Sometimes they cause the opponent to give up by applying pressure to arm joints or to the neck.

Kung fu is a martial art that began in China. Kung fu means “skill.” Many kung fu movements imitate the fighting styles of animals. There are hundreds of forms of kung fu. Most forms are

Three boys practice karate. Karate is one of the most popular martial arts.

unarmed, but some use swords or other weapons.

T’ai Chi ch’uan is an ancient Chinese martial art similar to kung fu. It is often called T’ai Chi for short. T’ai Chi is a popular form of exercise. The slow, flowing movements used in T’ai Chi can help to reduce stress.

Other unarmed martial arts include aikido, jujitsu, and Thai boxing. Aikido and jujitsu are Japanese. Thai boxing is the national sport of Thailand.

Martinique

Martinique is an oval-shaped island in the Caribbean Sea. It is an overseas department (a type of province) of France. Fort-de-France is Martinique’s capital and largest city.

A cathedral, or large church, stands in Fort-de-France, the capital of Martinique.

Geography

Martinique is part of the group of islands called the West Indies. Its nearest neighbors are Dominica, to the north, and Saint Lucia, to the south. The island is mostly mountainous. Short rivers flow down from the island's mountains. Martinique's highest peak is Mount Pelée, an active volcano. Martinique has a warm, humid climate with one rainy season each year. Hurricanes sometimes hit the island.

Plants and Animals

Forests cover almost half of Martinique. Palm, rosewood, white gum, and mahogany trees are common. Ferns and orchids grow in the lowlands. The southern coast has mangrove swamps. Martinique's few animals include mon-gooses, snakes, rabbits, and birds.

People

Most of the people of Martinique have a mixture of black, white, and Asian ancestors. There are small groups of French whites and East Indians. French and a local version of French are the main languages. Most people follow Roman Catholicism. Almost all the people live in cities or towns.

Economy

Tourism is the most important part of Martinique's economy. Factories make petroleum (oil) products, cement, sugar, and rum. The island's main crops are sugarcane and bananas. Martinique also depends heavily on aid from France.

History

Arawak Indians were Martinique's first settlers. The Carib Indians eventually drove the Arawak Indians off the island. Christopher Columbus visited Martinique in 1502. France established a colony on the island in 1635. The French brought people from Africa to work as slaves in the colony's sugarcane fields. Slavery finally ended in 1848.

In 1946 Martinique became a French overseas department. Since then some of the island's people have called for independence. France has responded by giving the island more control over its own affairs. Martinique elects representatives to its own legislature. It also sends representatives to the legislature in France.

Martyr

A martyr is someone who is willing to die for his or her religious beliefs. Martyrs are important in Christianity, Judaism, and Islam.

The ancient Romans sometimes killed Christians who refused to give up their religion. The apostles Peter and Paul were martyrs of this time. Many Christian martyrs became saints.

Jewish martyrs include members of a family known as the Maccabees, who died long ago in a fight to keep their religion. The Jewish holiday Hanukkah is based on the story of the Maccabees.

Most Muslims agree that there are two groups of martyrs: those killed in jihad, or holy war, and those killed unjustly because of their religion. Every year Shi'ite Muslims remember the death of martyr al-Husayn ibn 'Ali. Husayn was killed in battle in the 600s.

Religion

Mary, Queen of Scots

Mary Stuart became the queen of Scotland when she was a baby. She grew up hoping to be queen of England, too.

Mary was born on December 8, 1542, in Scotland. Her father was King James V of Scotland. When he died only a few days after her birth, she became queen.

Mary, Queen of Scots

Mary was raised as a Roman Catholic. However, Scotland followed the Protestant branch of Christianity. Many Scots did not want a Catholic queen. Others did not like the advisers she chose or her husband, Henry Stewart, called Lord Darnley.

In 1568 Mary fled her many enemies. Hoping that Queen Elizabeth I would help her, she rushed to England. But Elizabeth did not trust Mary. She knew that Mary had wanted to become queen of England. To protect herself, Elizabeth threw Mary into prison.

Mary remained in prison for the rest of her life. She went on trial in 1586 and was found guilty of plotting to have Elizabeth killed. Mary was beheaded on February 8, 1587.

Elizabeth I • Scotland

Maryland

In the 1630s King Charles I of England gave Lord Baltimore, an English nobleman, the right to set up a colony in America. The new colony was named Maryland in honor of the king's wife, Queen Henrietta Maria (Mary). Maryland is nicknamed the Old Line State. The nickname refers to Maryland's Revolutionary War troops, known as the Maryland Line. The capital of Maryland is Annapolis.

Geography

Maryland is bordered on the north by Pennsylvania. Delaware and the Atlantic Ocean are on Maryland's eastern border. West Virginia is on Maryland's western border. To the south, the Potomac River separates Maryland from West Virginia and Virginia. The District of Columbia is on the Maryland side of the Potomac. The district is surrounded by Maryland on three sides. Within the district is Washington, D.C., the country's capital.

One of Maryland's most notable features is Chesapeake Bay. This large body

Modern and historic buildings line the Inner Harbor in Baltimore, Maryland.

of salt water juts into the state from the south. From east to west Maryland has several different types of landscape. A coastal plain along the water merges into a rolling plateau. To the west of the plateau is a section of the Blue Ridge Mountains. The Appalachian Mountains are located in the far west of the state. The Cumberland Valley lies between the two mountain ranges.

People

Today, whites of European heritage make up about two thirds of Maryland's population. In the 1600s the first Europeans to move to Maryland were mostly from England. German-speaking farmers from Pennsylvania moved to western Maryland during the 1700s. In the 1800s many British, German, Irish, Russian, Polish, Greek, Czech, and Italian people arrived.

Maryland has a significant African American population. African Ameri-

cans now make up more than one fourth of Maryland's residents. After the American Civil War, former slaves from the South moved north to Baltimore. In Baltimore they joined a well-established community of blacks who had been free for several generations. People of Asian heritage and people of Hispanic heritage each represent about 4 percent of the population.

Economy

Food processing is a major manufacturing industry, as is the making of chemical products. Leading products from Maryland's farms are broiler chickens and plant products raised in greenhouses. Farmers also grow soybeans, corn, and wheat. Dairy goods and cattle are important as well. Chesapeake Bay fishermen catch blue crab, a famous Maryland shellfish. The U.S. government is the largest employer in Maryland. Many government employees live in counties near Washington, D.C.

History

Native Americans had villages in the area by AD 1000. Most Indians in Maryland were Susquehanna or Algonquian. By the mid-1700s, the majority of Native Americans had moved farther west.

In the early 1630s, Lord Baltimore began planning an American colony for English Roman Catholics. At the time Catholics faced discrimination in England because of their religion. The colony was started in 1634. In 1649 Maryland passed America's first law regarding religious toleration. The law granted religious freedom to all Christians in the colony.

Many people from Maryland fought in the American Revolution. Following England's defeat, Maryland became the seventh state in the Union on April 28, 1788. In 1791 Maryland provided land to help form the District of Columbia.

Maryland remained part of the Union during the American Civil War. During that period some Marylanders owned slaves. A few Maryland men joined the Southern cause and fought against the Union.

During the 1800s the state had a strong economy and its population grew. The state continued to grow in the 1900s. The population more than doubled in the 50 years from 1950 to 2000.

Lesotho

Massachuset

The Massachuset were Native Americans who lived along the coast of what is now the U.S. state of Massachusetts. The state was named after the tribe.

The Massachuset lived in bark-covered homes called wigwams. Wigwams were large enough for several families. The Massachuset grew corn, beans, and squash. They also fished and hunted deer and other animals.

In 1605 French explorers arrived in Massachuset territory. The tribe welcomed the traders who followed. But many of the Massachuset died from smallpox and other diseases brought by the Europeans.

In 1646 an English pastor named John Eliot came to live with the Massachuset. He convinced many tribe members to become Christians. The Christian Massachuset moved to villages with Christian Indians from other tribes. The Indians in these villages became known as Praying Indians. The most important of the villages was Natick, near Boston.

In 1675 neighboring tribes declared war on English settlers who were taking their lands. This war became known as King Philip's War. During the war neither side trusted the Praying Indians. The English raided the Praying Indians' villages and took some Massachuset captive. They sold some of the captives as slaves.

The surviving Massachuset scattered. Many found homes among other Indian tribes. By the 1800s the Massachuset no longer existed as a separate tribe.

King Philip's War • Native Americans

Did You Know?

A Massachuset-language Bible was the first Bible ever printed in what is now the United States. It was completed in 1663.

Massachusetts

The U.S. state of Massachusetts got its name from the region's local Native Americans, the Massachuset tribe. They lived in the Great Blue Hill region in the southeastern part of the state. The Native American words that make up the name Massachuset are thought to mean "at or about the great hill." Massachusetts is nicknamed the Bay State because early settlers made their home along Cape Cod Bay. The state capital is the historic city of Boston.

Geography

Massachusetts is located in the northeastern United States in a region known as New England. The state is bordered on the north by New Hampshire and Vermont. New York is on the western border of Massachusetts. Massachusetts shares its southern border with Connecticut and Rhode Island. The Atlantic Ocean shapes the state's eastern border.

Cape Cod is in the southeastern part of the state. It is a large peninsula that juts into the Atlantic Ocean. Several islands are also part of Massachusetts: Martha's Vineyard, the Elizabeth Islands, and Nantucket.

Massachusetts has several natural regions. It rises from a coastal plain and lowland in the east to a raised, flat plateau region in the center of the state. The Berkshire Hills region is in western Massachusetts.

People

Whites of European heritage account for about four fifths of the state's population. The earliest European settlers in what is now Massachusetts were the English who arrived in the early 1600s. During the mid-1800s the Irish arrived. They fled from Ireland in order to escape the poverty and hunger of the Irish potato famine. Later Italians, Portuguese, Scandinavians, Poles, and others came to the state.

Hispanic Americans now make up the largest minority group in Massachusetts. Puerto Ricans represent about half of the Hispanic population in Massachusetts. African Americans and Asians are the next largest minorities.

Economy

A significant part of the economy in Massachusetts is devoted to the research and development of new technology.

A brook winds through a wooded area of Moore State Park in Massachusetts.

Many high-technology companies are located in the Boston area.

Service industries such as education and tourism are also important to the economy. Massachusetts is famous for its excellent colleges and universities. These include the Massachusetts Institute of Technology, Tufts University, and Harvard University. The state's many schools employ a large number of people as teachers and administrators. Tourism businesses such as hotels and restaurants also employ many people in Massachusetts. Popular tourist areas include Boston, the Cape Cod region, and the Berkshires.

The state's manufacturing businesses make industrial machinery, electronic equipment, medical supplies, and computer parts. Because of the state's poor

soil conditions, farming has never been central to the economy.

History

Native Americans had been living in the Massachusetts area for thousands of years before Europeans arrived. In 1620 the first European settlers landed at Plymouth on a ship named the *Mayflower*. These settlers, called Pilgrims, were people who had broken away from the Church of England to form a separate church. They established Plymouth Colony. Another group called the Puritans later established the larger Massachusetts Bay Colony to the north. In 1691 the Plymouth Colony became part of the Massachusetts Bay Colony.

During the 1700s Massachusetts became known as a trading center. As wealth

increased, so did the desire for self-government. Colonists resented all of the taxes Britain made them pay. A series of events led Britain and the colonists to war. In 1770 British soldiers and an angry mob clashed in an event known as the Boston Massacre. In 1773 some colonists dumped British tea into Boston Harbor to protest the tea tax. This act was known as the Boston Tea Party.

In April 1775 the “shot heard round the world” was fired at Concord to start the American Revolution. Massachusetts was the site of many conflicts in this war, including the battle of Bunker Hill. Britain was defeated and the colonies became independent in 1783. In 1788 Massachusetts became the sixth state to approve the U.S. Constitution.

The state’s economy declined after the American Revolution. It continued to struggle until after the War of 1812, when textile mills and factories were opened in Lowell. The opening of new

Cape Cod is a popular destination for tourists in the summertime.

factories brought jobs to thousands of workers. As a result of this new type of business activity, Massachusetts became the North American center of the Industrial Revolution. The state also became a center for literature, the arts, sciences, and social-reform movements.

Massachusetts was strongly against slavery. As a result, it fought on the side of the Union during the American Civil War (1861–65).

In the 1900s the state’s economy went through a number of changes. The textile and shoe industries left the state, causing years of economic decline. The economy improved when the electronics and communications industries emerged after World War II. In the late 20th century Massachusetts became a leader of the high-technology industry. This revived the state’s economy.

Massachusetts Bay Colony

In 1630 a group of people called Puritans left England for North America. The settlement they started in America was called the Massachusetts Bay Colony.

The Puritans were a group of Protestant Christians with strict religious beliefs. They disagreed with some practices of England's official church, the Church of England. The English government mistreated them because of their beliefs. The Puritans wanted to find a place where they could practice their religion in peace. In 1629 King Charles I of England gave a group of Puritans permission to trade and settle in America.

The group was called the Massachusetts Bay Company.

The Massachusetts Bay Company sent more than 1,000 Puritans across the Atlantic Ocean in 1630. They were the first settlers of the Massachusetts Bay Colony. Their leader was John Winthrop. They set up their own government and started several towns. Boston was the most important town.

The Puritans did not allow people who disagreed with their religious beliefs to live in the colony. Roger Williams was one of the people who was forced to leave. He then founded the colony of Rhode Island.

Trouble gradually built up between England and the Massachusetts Bay Colony. The king had not wanted the

colonists to govern themselves. In 1684 King Charles II put the Massachusetts Bay Company out of business. In 1691 England created a new Massachusetts Bay Colony by combining the old colony with Plymouth Colony and other lands. The new colony was controlled by the English government.

Massasoit

An illustration shows an English colonist visiting with Chief Massasoit in 1621.

Massasoit was a chief of the Wampanoag in the 1600s. The Wampanoag were Native Americans who lived in what is now Massachusetts and Rhode Island. Massasoit is remembered for keeping peace with the Pilgrims, a group of English settlers who set up a colony on his tribe's land.

Massasoit was born in about 1590. In 1620 the Pilgrims arrived from England and started Plymouth Colony. By that time Massasoit was a chief. In 1621 he visited Plymouth. He was friendly to the Pilgrims and signed a peace treaty with them. He encouraged his people to show the colonists how to farm, fish, and hunt. To thank Massasoit, the English invited him and other Wampanoag to a great feast. The event is now celebrated as the first Thanksgiving.

Massasoit kept the peace until he died in 1661. But tension had started to build up because some colonists refused to follow his treaty. They took more and more Indian land. In 1675 Massasoit's son Metacom (called King Philip by the English) tried to drive out the colonists. This led to a war called King Philip's War. The war was a disaster for the Wampanoag. The tribe was defeated, and most of its people were killed.

Mastodon and Mammoth

Mastodons and mammoths were elephantlike animals that roamed Earth in large numbers thousands of years ago. These animals later became extinct.

Where and When Mastodons and Mammoths Lived

Mastodons were early relatives of mammoths. They first dominated Earth

Did You Know?

Early Native Americans hunted both mammoths and mastodons.

American mastodon

woolly mammoth

African savanna elephant

Mastodons were smaller than mammoths and modern elephants. Both mastodons and mammoths had more hair than modern elephants.

about 25 million years ago. Mastodons lived all over the world.

Mammoth remains have been found on every continent except Australia and South America. The animals lived sometime between 1,800,000 and about 10,000 years ago.

Physical Features

Mastodons were shorter than modern elephants but were more heavily built. The legs were short, massive, and like pillars. Mastodons were covered with long, reddish brown hair.

In comparison, most of the mammoth species, or types, were about as large as modern elephants. They were about 10 to 13 feet (3 to 4 meters) tall. Mammoths had a woolly, yellowish brown undercoat about 1 inch (2.5 centimeters) thick.

Study of Fossils

The bodies of many mammoths and mastodons have survived for thousands of years because they were trapped in

ice. These frozen remains were eventually discovered by humans and used for study. Early humans also made paintings of some of the animals on the walls of caves in Europe. The paintings provide more clues about these wild beasts.

Extinction

Scientists are not sure why mastodons and mammoths died out. It may have been because of a change in the weather where they lived. Experts think that as the weather got colder, thick ice sheets covered vast areas of land. This destroyed the grasslands on which the animals lived and fed.

Mathematics

Mathematics, or math, is the study of numbers and how they are related to each other and to the real world. Math is as important as language. In fact, people sometimes describe math as a kind of language. Everyone uses math every day—to tell time, to play games, to

cook, to build things, and to do almost any kind of work.

Types of Mathematics

There are many branches of mathematics. Some of the main ones are arithmetic, algebra, geometry, trigonometry, calculus, statistics, and probability.

Mathematics also may be divided into two general areas: pure and applied. Pure math is the study of math for its own sake. Applied math is the study of math for the purpose of solving real-life problems. People use applied math to build skyscrapers, make computers, predict earthquakes, explain how the economy works, and many other things.

History

People have used mathematics since ancient times. The Egyptians could not

Workers look at the plans for a building. The use of mathematics to construct buildings is an example of applied math.

have built the pyramids without a very good understanding of math, especially arithmetic and geometry. The Babylonians of ancient Mesopotamia (now in Iraq) invented a complex number system and used fractions.

The ancient Greeks greatly expanded math with many new ideas. In about 300 BC the Greek mathematician Euclid wrote an important book on geometry called *Elements*. Later, the Arabs also contributed greatly to math. In the AD 800s an Arab mathematician named al-Khwarizmi described a problem-solving system that is now known as algebra.

The ancient Greek and Arab ideas about math eventually spread to western Europe. Math progressed as European scientists used it to research other subjects. In the 1600s the astronomer Johannes Kepler used new mathematical ideas to study the skies. Other scientists in the 1600s, namely Galileo and Isaac

Children study different types of mathematics at school. One of the first types they learn is basic arithmetic—adding, subtracting, multiplying, and dividing.

Newton, applied math to the study of motion. In the 1800s and 1900s scholars developed many new ways to study and use math.

Matter

Anything that takes up space is called matter. Air, water, rocks, and even people are examples of matter. Different types of matter can be described by their mass. The mass of an object is the amount of material that makes up the object. A bowling ball, for example, has more mass than a beach ball.

States of Matter

Matter exists in several different forms, called states. The three most familiar states are solid, liquid, and gas.

Rocks, books, desks, and balls are examples of solids. Matter in the solid state has a set size and shape. A solid's size and shape do not change easily. For example, when a person moves a book

from a smaller to a bigger box, the book looks the same.

Milk and water are examples of liquids. In the liquid state, matter has a set size, or amount. However, its shape depends on its container. For example, milk changes shape when a person pours it from a carton into a glass. But the amount of milk stays the same.

The air and the helium used to fill balloons are examples of gases. Matter in the gaseous state does not have either a set size or a set shape. It can expand to fill a large container, or it can be squeezed into a smaller container.

Matter can change from one state to another. For example, heat causes ice (solid water) to melt into a liquid. Heat also causes liquid water to evaporate, or turn into water vapor—a gas.

Properties of Matter

All matter has physical properties. A physical property is one that a person can measure without changing the matter. Color, amount, and temperature are examples of physical properties.

All matter also has chemical properties. A chemical property tells how matter will change under special conditions. For example, certain metals turn to rust if they sit out in the rain. Paper and wood burn to ashes if they touch a flame. Burning and rusting are called chemical reactions. Chemical reactions change matter into new types of matter.

The three most familiar states of matter are solid, liquid, and gas. Water exists in all three states.

Mauritania

Mauritania, a country in West Africa, lies in the huge desert called the Sahara. Its capital is Nouakchott.

Geography

Mauritania shares borders with Western Sahara, Algeria, Mali, and Senegal. The Senegal River forms part of the southern border. The Atlantic Ocean is to the west. Most of the land is flat. Sand dunes cover about half of the country.

Plants and Animals

The northern part of Mauritania is a desert with few plants. The savanna, or grassland, in the south has baobab and palm trees. Lions, elephants, ostriches, and panthers live on the savanna.

People

Most of the people are Moors. These are the descendants of Arabs and Berbers (the original inhabitants of North Africa). Black Africans make up the rest of the population. The main language is

A woman paints the wall of her house in Mauritania.

Arabic. Islam is the national religion. More than half of the people live in cities or towns. But many people follow a nomadic (wandering) lifestyle.

Economy

Mining, fishing, and farming are important parts of Mauritania's economy. Iron ore and fish are valuable exports. In the early 21st century Mauritania also started to export oil. Many of Mauritania's people raise sheep, goats, cattle, or camels. Rice, millet, sorghum, beans, and dates are major crops.

History

The first people in what is now Mauritania were black African and Berber peoples. Arab tribes moved into the area in the 1400s. France set up settlements in the 1800s. In 1920 the area became a French colony. Mauritania gained independence in 1960.

Mauritius

Mauritius is a small island country off the southeast coast of Africa. Mauritius' capital is Port Louis.

Geography

Mauritius lies in the Indian Ocean about 500 miles (800 kilometers) east of Madagascar. The country includes the large island called Mauritius as well as several smaller islands.

Plants and Animals

Most of Mauritius' forests were cut down to make room for sugar plantations. Its remaining plants include bamboo, coconut palms, and ebony trees. The country's unique wildlife includes the sambar (a long-tailed deer) and the tenrec (a spiny mammal). A large bird called the dodo once lived in Mauritius, but the last dodo died before 1681.

Farmland and low mountains are common sights in Mauritius.

People

Most Mauritians have roots in southern Asia. About a quarter of the people are Creoles. Creoles have a mixture of white, Asian, and African roots. English and Creole are the main languages. People follow Hinduism, Christianity, or Islam.

Economy

Tourism and banking are important to the economy. Factories make clothing and sugar. Crops include sugarcane, bananas, and vegetables.

History

In 1598 the Dutch arrived on the island. They named it Mauritius after Maurice of Nassau, the governor of the Netherlands. In 1715 France took control. In 1810 Great Britain seized the island. Mauritius gained independence in 1968.

Mauryan Empire

Before 321 BC the region of India contained many small kingdoms and territories. But with the beginning of the Mauryan Empire that year, many of those small parts came under one ruler.

At one point the Mauryan Empire stretched from the Himalayas in the northeast to what is now Afghanistan in the northwest. It also reached south, almost to the tip of India. This unity of territory brought progress in many areas of Indian life, including art, trade, and politics.

The first leader of the empire was Candragupta. He founded the Maurya dynasty, or ruling family, in 321 BC. To expand his territory, Candragupta conquered many surrounding lands. His son Bindusara, who took the throne in 297 BC, conquered more lands to the south.

The region around Bodhi Gaya, India, was once a part of the Mauryan Empire. In the 200s BC the Mauryan emperor Asoka built a shrine where a large Buddhist temple now stands.

Asoka, Bindusara's son, is the best known of the Mauryan emperors. After becoming a Buddhist, Asoka began writing about his new religion. Much of this work included rules that he expected his people to follow. People carved many of Asoka's Buddhist rules on pillars and rocks and in caves. Asoka's religious influence was so great that he is one of the most famous rulers in Indian history.

The land of the Mauryan Empire was divided into four provinces, or states. These were further divided into districts and villages. A prince of the royal family governed each province.

Mauryan society was divided into seven groups, or castes. These included philosophers, farmers, soldiers, herdsmen, artisans, judges, and councillors. Monks, priests, and teachers belonged to the philosopher caste.

A military commander assassinated the last Mauryan emperor, Brhadratha, in 185 BC. The commander founded his own dynasty, and the Mauryan Empire ended.

Maya

The Maya are Native Americans of Mexico and Central America. Between about AD 250 and 900 the Maya had a way of life that was very advanced for the time. The Mayan civilization began a fast decline after 900. No one knows for sure why this happened.

Did You Know?

After the Mauryan Empire ended, the Shunga dynasty ruled in central India for about a century.

Mayan buildings still stand in the ancient city of Chichén Itzá in Mexico.

How the Maya Lived

The Maya lived first in villages and later in cities. Their cities had large temples, stone pyramids, palaces, and ball courts. The Maya created farmland by cutting away the trees and vines of the surrounding rain forest. They grew corn, beans, and squash.

The Maya created a writing system called hieroglyphics, which used pictures instead of words. They also studied the planets and the stars. They used their observations of the heavens to make a very accurate calendar. The Maya also developed a system of mathematics.

The Maya worshipped a number of nature gods. These included gods of the sun, the moon, rain, and corn. In religious ceremonies, the Maya killed people they had captured during battle. They thought that the gods needed human blood for nourishment.

History

The Maya lived in villages by about 1500 BC. By AD 200 they were living in cities. By 900 they had built more than 40 cities. Some of the most important cities were Tikal, Palenque, Copán, and Bonampak. Today these cities are found in Guatemala, Honduras, and southern Mexico.

After 900 the number of Maya fell. They abandoned many of their cities. War may have been one of the causes of this decline. In the early 1500s the Spanish arrived in Mayan territory. The Spanish forced the Maya to work for them. Many Maya died from diseases that the Spanish brought with them. Today descendants of the Maya live in Mexico, Guatemala, and Belize.

May Day

May Day is a spring holiday celebrated on May 1. Many people celebrate May Day with festivals or flowers. One of the

Schoolchildren celebrate May Day with a traditional maypole.

oldest May Day traditions is the maypole. A maypole is a tree trunk or pole decorated with colorful ribbons. On May Day dancers hold the ribbons and dance around the pole. In some countries May Day is a holiday that honors workers, similar to Labor Day. May Day is not an official holiday in the United States.

May Day began as a spring festival in Europe. In ancient times and during the Middle Ages (AD 500–1500) Europeans welcomed the end of winter. With the arrival of spring, they were able to grow crops again. They celebrated with eating, singing, and dancing. The tradition of May Day as a workers' holiday began in the late 1800s.

Labor Day

Mayflower

In 1620 a ship called the *Mayflower* carried a group of English people across the Atlantic Ocean to North America. These people set up the first permanent European colony in New England at what is now Plymouth, Massachusetts. Later they became known as the Pilgrims.

Background

The Pilgrims were Separatists, or people who had separated from the Church of England. They were looking for the freedom to practice their own strict form of Protestant Christianity, known as Puritanism.

An illustration shows the *Mayflower* sailing across the Atlantic Ocean to North America.

A group of English Separatists settled in Holland (now The Netherlands) in 1608. They had religious freedom there, but they did not feel at home. They decided to go to North America, where they could keep their English ways.

The Separatists first returned to England on a small ship called the *Speedwell*. Then they got the *Mayflower* in a deal with some merchants. People hired by the merchants also traveled on the *Mayflower*. They outnumbered the Separatists.

Voyage

The *Mayflower* set sail from Plymouth, England, in September of 1620. The captain was Christopher Jones. With more than 100 passengers, the ship was overcrowded. The sanitary conditions were terrible. Many suffered from seasickness. After 66 days, the *Mayflower*

Did You Know?

It is believed that the *Mayflower* made a few voyages after returning to England and was then broken apart and sold for wood.

landed on Cape Cod, in what is now Massachusetts, on November 21, 1620.

Arrival

While still aboard ship, the travelers prepared an agreement called the Mayflower Compact. In it they agreed to govern themselves with “just & equal laws.” All the adult males on the ship, including the non-Separatists, signed the compact.

The travelers stayed on the ship until the leaders decided where to settle. Finally in December they chose a place, which they named Plymouth. The *Mayflower* remained nearby throughout the first winter. People stayed on it until they built houses. The ship went back to England in the spring of 1621.

Mays, Willie

Willie Mays was a great baseball player known for both his batting and his fielding. He ranks among the all-time leaders in home runs, hits, runs scored, and runs batted in (RBI).

Willie Howard Mays was born on May 6, 1931, in Westfield, Alabama. In 1948 he joined the Birmingham Black Barons of the Negro National League. He was still in high school.

In 1950 Mays graduated and signed a contract with the New York Giants of the National League. He played two seasons in the minor leagues before join-

Baseball player Willie Mays hits a home run in 1964.

ing the Giants at the major league level. Mays was named rookie of the year for the 1951 season.

Mays missed almost all of the 1952 and 1953 seasons while serving in the U.S. Army. He returned to baseball in 1954 and became a star. He played for the Giants in New York and, from 1958 to 1972, in San Francisco. Mays led the league in home runs four times. He also led in stolen bases four times. As a center fielder he won 12 Gold Glove awards for outstanding defensive play. Mays played in 24 straight All-Star games.

In 1973 Mays finished his career back in New York as a member of the Mets. He retired with 660 home runs, 3,283 hits, 2,062 runs scored, and 1,903 RBI. Mays was elected to the Baseball Hall of Fame in 1979.

Mbabane

Population
(2006 estimate)
78,700

Swaziland, a country in southern Africa, has two main capitals—Mbabane and Lobamba. Most of Swaziland's government offices and its High Court are in Mbabane. The country's lawmakers meet in Lobamba.

Mbabane is among the larger cities in Swaziland. It lies on the Mbabane River within a hilly region. The city is a center of government and business. The main tourist center in Swaziland lies just outside Mbabane.

Mbabane developed in the late 1800s around the place where the Swazi king kept his cattle. Great Britain took control of Swaziland in the early 1900s. The

British made Mbabane the capital of Swaziland. In 1968 Swaziland became an independent country. Mbabane remained the center for much of the country's government.

McKinley, Mount

Mount McKinley is the highest mountain in North America. It rises to a height of 20,320 feet (6,194 meters). It is located near the center of the Alaska Range in south-central Alaska. The mountain has two peaks, the southern peak being the higher. The upper two thirds of the summit is covered year-round with snow and huge glaciers.

The Athapaskan Indians who lived in the region called the mountain Denali, meaning "the high one." In 1889 it was named Densmores Peak after Frank Densmore, an explorer. The mountain was renamed Mount McKinley in 1896

McKinley, William

The 25th president, William McKinley helped make the United States into a world power. After a war with Spain, the United States controlled an empire stretching from the Caribbean Sea to the Far East.

Early Life

William McKinley was born on January 29, 1843, in Niles, Ohio. He attended college for a few months, taught school, and worked in a post office. During 1861–65 McKinley fought in the American Civil War.

After the war McKinley studied law. McKinley married Ida Saxton in 1871. The couple had two children, but they both died.

Political Career

In 1876 McKinley was elected to the U.S. House of Representatives. He served for six terms. From 1892 to 1896 McKinley was the governor of Ohio.

In 1896 the Republican Party chose McKinley to run for president. After defeating his opponent, William Jennings Bryan, McKinley became president on March 4, 1897.

Presidency

During McKinley's presidency many people wanted the United States to help Cuba gain independence from Spain. Congress declared war in April 1898. The United States easily defeated the Spanish forces in a few months. The

William McKinley was the 25th president of the United States.

TIMELINE

McKinley is born in Niles, Ohio.

January 29, 1843

McKinley becomes governor of Ohio.

1892

McKinley is elected to the U.S. House of Representatives.

1876

McKinley is elected president.

1896

Congress declares war on Spain.

April 25, 1898

McKinley is reelected.

1900

McKinley is killed; Theodore Roosevelt becomes president.

1901

Spanish-American War ended with a treaty that gave Puerto Rico, Guam, and the Philippines to the United States. Cuba became independent.

The successful war and a good economy made McKinley very popular. He won reelection in 1900. Theodore Roosevelt became vice president. (McKinley's first vice president, Garret A. Hobart, had died.) During McKinley's second term, he proposed trade agreements with other countries to lower the taxes charged on each other's goods.

Assassination

In 1901 McKinley attended the Pan-American Exposition in Buffalo, New York. While the president was meeting with the public, a man in the crowd shot him in the chest and stomach. The shooter was an anarchist—a person who believes that all government is unnecessary. McKinley was rushed to a nearby hospital, but doctors could not save

him. The president died eight days later, on September 14, 1901.

Measles

Measles is a disease that is caused by a germ called a virus. Children get measles most often, but adults can get it, too. Adults tend to have more severe cases.

Measles spreads very easily from person to person. When a person with measles coughs or sneezes, the virus spreads into the air. People who breathe in the virus are infected.

The first symptoms, or signs, of measles appear about 10 days after a person is infected with the virus. At first measles is like a severe cold. The infected person

Before the late 1960s, nearly every child got measles.

has a runny nose, a fever, and red, watery eyes. Then bluish white spots appear on the insides of the cheeks. The fever gets higher, and a red rash appears on the face and behind the ears. The rash then spreads to the rest of the body.

Measles usually goes away after a few days. In some people, however, it can lead to more serious health problems. These include pneumonia and encephalitis, or swelling of the brain.

There is no drug to fight measles. A person with the disease must get plenty of rest and drink a lot of fluids. People can prevent measles by getting a shot of a substance called a vaccine. The vaccine protects the body from the measles virus.

Vaccine • Virus

Measurement

Length, volume, and weight are examples of measurements. People use measurements every day at home, at work, and in school.

In order to be accurate, all measurements must make a comparison with something called a standard. A standard is a quantity, or amount, that everyone agrees on. For example, everyone agrees that 1 pound is a certain amount of weight. So, 2 pounds equal twice that amount, 3 pounds equal three times that amount, and so on. There are different standards for measuring length, volume, area, and many other things.

Units are the names used for different standards. For example, a pound is a

A cylinder that weighs exactly 1 kilogram is kept by the International Bureau of Weights and Measures in Paris, France. The kilogram is a unit of weight in the metric system of measurement.

unit of weight. Units may also be divided into smaller units. For example, a foot is a unit of length that may be divided into 12 smaller units, called inches. Measuring instruments, such as scales and rulers, are marked with these units.

All standards belong to a particular system of measurement. Throughout history, people have come up with many systems of measurement. Each system has its own set of standards. That is, each has a different way of measuring. Pounds and kilograms are both units of weight, but each belongs to a different system. Therefore a box that weighs 2.2 pounds in one system weighs 1 kilogram in another. The two most widely used systems are the English system and the metric system.

English System

The system of measurement most commonly used in the United States is based on the English system. This

Some Basic Measures in the U.S. Measurement System	
Length	
12 inches = 1 foot	
3 feet = 1 yard	
5,280 feet = 1 mile	
Weight	
16 ounces = 1 pound	
2,000 pounds = 1 ton	
Liquid Volume	
16 fluid ounces = 1 pint	
2 pints = 1 quart	
4 quarts = 1 gallon	
Area	
640 acres = 1 square mile	
Cooking	
3 teaspoons = 1 tablespoon	
2 tablespoons = 1 fluid ounce	
8 fluid ounces = 1 cup	

system developed in England, and English settlers brought it to the American colonies.

In this system the inch is a unit of length. There are 12 inches in 1 foot and 5,280 feet in 1 mile. The cup is a unit of volume (used to measure liquids). There

Some Metric Prefixes			
Prefix	Name	Equal to	Examples
mega	million	1,000,000	One megabyte equals one million bytes. (A byte is a unit of measurement for computer storage space.)
kilo	thousand	1,000	One kiloliter is equal to one thousand liters.
hecto	hundred	100	One hectogram is equal to one hundred grams.
deka (also spelled deca)	ten	10	One decameter is equal to ten meters.
deci	tenth	0.1	One deciliter is equal to one tenth of a liter.
centi	hundredth	0.01	One centimeter is equal to one hundredth of a meter.
milli	thousandth	0.001	One millisecond is equal to one thousandth of a second.
micro	millionth	0.000001	One microgram is equal to one millionth of a gram.
Note: To convert from one metric measurement to another, simply move the decimal point in the measurement being converted. For example, to convert millimeters to centimeters, move the decimal point over one place to the left. 27 millimeters is equal to 2.7 centimeters. To convert kilograms to decigrams, move the decimal point four places to the right. 3.3 kilograms is equal to 33,000 decigrams.			

Some Conversions Between U.S. and Metric Measurements	
<i>Length</i>	
1 inch = 2.54 centimeters	
1 foot = 0.3048 meter	
1 mile = 1.6093 kilometers	
1 centimeter = 0.3937 inch	
1 meter = 3.2808 feet	
1 kilometer = 0.62137 mile	
<i>Liquid Volume</i>	
1 quart = 0.9463 liter	
1 gallon = 3.785 liters	
1 liter = 1.0567 quarts	
1 liter = 0.2642 gallon	
<i>Weight</i>	
1 pound = 0.45359 kilogram	
1 kilogram = 2.2046 pounds	

are 2 cups in 1 pint, 2 pints in 1 quart, and 4 quarts in 1 gallon. The ounce is a unit of weight. There are 16 ounces in 1 pound and 2,000 pounds in 1 ton.

Many of the names for these units come from the fact that, at first, people used everyday objects to measure things. The length of a person's foot was used to measure short distances. A household cup might be used to measure liquids. But without standards, these measurements were not the same for everyone. Eventually people set standards, and the English system became the first world-wide system of measurement.

Metric System

In the 1790s France developed the metric system of measurement. By the middle of the 1900s most countries had adopted this system. In the metric sys-

tem, each kind of measurement has one basic unit. The meter is the basic unit of length, the gram is the unit of weight, and the liter is the unit of volume. Each unit is divided into smaller units or combined into larger units by multiples of 10.

Standard prefixes, or parts of words, are added to the beginning of the basic unit to tell how many multiples of 10 are in a unit. For example, "kilo-" means "thousand" so there are 1,000 meters in 1 kilometer. And "centi-" means " $\frac{1}{100}$ " so 1 meter is equal to 100 centimeters.

Mecca

Population
(2007
estimate), urban
area,
1,385,000

Mecca is a city in Saudi Arabia, a country in the Middle East. The city was the birthplace of Muhammad, the founder of Islam. Muslims all over the world turn toward Mecca to pray five times each day. It is the world's holiest city to Muslims. Because of that, only Muslims are allowed to enter Mecca.

Every Muslim who is able to must make a religious journey, or pilgrimage, to Mecca at least once. The pilgrims visit the Great Mosque. In the mosque's courtyard is the holy Ka'bah, a small

Medici Family

The Medici were a wealthy and powerful family of Italian bankers and merchants. Their power was at its height in the 1400s and 1500s, when they ruled the city of Florence, Italy. They eventually ruled the surrounding region of Tuscany, too.

The Medici held important positions in Florence's government. They also were the bankers of the pope, the leader of Roman Catholicism. Several popes came from the Medici family. Two Medici women—Catherine de Médicis and Marie de Médicis—became queens of France.

The Medici used their vast wealth to keep their political power. They also spent their money on architecture and the arts. Some of the world's greatest buildings, statues, and paintings once belonged to the Medici.

Hundreds of thousands of pilgrims gather at the Great Mosque in Mecca.

building that contains the Black Stone of Mecca. Legend says that the stone was given to Adam, the first man, when he was forced to leave paradise. Pilgrims walk around the Ka'bah seven times. They also touch or kiss the Black Stone.

The millions of pilgrims who visit Mecca each year are important to the city's economy. Many city residents work at jobs providing food, housing, and other services to the pilgrims.

In ancient times Mecca lay on a major trade route. Muhammad was born in the city in about AD 570. He was forced to leave in 622, but he returned in 630 and took control of the city. He declared Mecca a place of Muslim pilgrimage.

Mecca was part of the Turkish Ottoman Empire for hundreds of years, from 1517 to 1918. A little later the city became part of Saudi Arabia.

Several paintings by the famous artist Peter Paul Rubens show events from the life of Marie de Médicis. Marie was a member of the Medici family who became queen of France.

Did You Know?

Three children of Catherine de Médicis and the French king Henry II also became kings of France—Francis II, Charles IX, and Henry III.

Cosimo de' Medici

Born in 1389, Cosimo de' Medici was the first Medici to gain power in Florence. He helped to bring the ideas of ancient Greece to Florence. These Greek ideas became popular and helped to fuel the Renaissance, an important period for the arts and sciences. Cosimo also collected works by important artists, including Donatello and Fra Angelico. Cosimo died in 1464.

Lorenzo de' Medici

Lorenzo de' Medici was born in 1449. As his power grew, he became known as Lorenzo the Magnificent. Lorenzo's daughter married a son of Pope Innocent VIII. (The son was born before Innocent became a priest.) This marriage gave the Medici almost complete control over Florence and Rome.

Lorenzo founded an academy for artists in Florence. He supported the artists Michelangelo and Leonardo da Vinci. Lorenzo was also a poet. He added hundreds of works to the family library. Lorenzo died in 1492.

Pope Leo X

Lorenzo's son Giovanni was born in 1475. In 1513 he was elected pope. He took the name Leo X.

Pope Leo brought in artists and architects to work on the Vatican Palace (the pope's home) and Saint Peter's Basilica (a huge church) in Rome. Among the artists Leo hired were Raphael and Michelangelo. Leo died in 1521.

The Last Medici

Over time the power of the Medici weakened. In 1743 Cosimo de' Medici's great-great-great-granddaughter, Anna Maria Luisa, died. She was the last of the family. Her will gave the Medici art collection to Florence and Tuscany. Many of the Medici treasures remain in Florence for all to see.

Medicine

Medicine is the science of keeping people healthy and healing the sick. Humans have practiced forms of medicine for thousands of years. Today specially trained people called physicians, or doctors, practice medicine.

Doctors

There are many parts to a doctor's job. Doctors first need to identify what is

Young children need frequent check-ups to make sure that they are healthy and growing well. Doctors who specialize in treating children are called pediatricians.

making a person sick. Then they decide on a treatment. They also predict when the patient will feel better. In addition, doctors try to prevent illnesses. When treating patients, doctors work with many other people, including nurses, therapists, and physician assistants.

Becoming a doctor involves years of education and training. Medical students first graduate from college. Then they spend three to four years in medical school. Students usually earn a Doctor of Medicine degree in medical school. After medical school, most graduates enter a residency, which is a training program usually in a hospital. During a residency, experienced doctors train the new doctors for three to seven years. During this time, new doctors can specialize in a particular type of medicine in such areas as internal medicine or surgery. Finally, new doctors must pass a test to get a license to practice medicine.

History

The ancient Greek doctor Hippocrates is considered the Father of Medicine. He treated medicine as a science. He made detailed observations of his patients and thought that diseases had a physical cause. Before that people had thought that diseases were caused by the gods or evil spirits. Another important ancient doctor was Galen of Pergamum, in the Roman Empire. He wrote many works about the human body.

In about AD 1000 a doctor from Iran named Avicenna wrote an important medical book. Doctors in the Middle

Two surgeons look at X-rays of a patient's body. Surgeons are doctors who perform surgery, or operations.

East and Europe followed the teachings of this book for centuries.

From the 1500s to the 1700s Europeans used science to make many medical discoveries. By the late 1700s an English doctor discovered vaccines. These are substances that can prevent disease.

Doctors in the 1800s began to use stethoscopes, X-rays, and many other helpful devices. They learned how germs cause disease. They also learned that cleaning hands and medical instruments helps to kill germs.

In the 1900s scientists developed vaccines to prevent many diseases and drugs to treat many others. Doctors transplanted organs from one person into another. They used many machines to help them to identify and treat diseases. They also learned how good nutrition helps people to stay healthy.

Today doctors have many ways to help patients heal. But there are still many

unanswered questions in medicine. For example, scientists are still searching for cures for cancer, AIDS, and many other diseases.

Mediterranean Sea

The Mediterranean is a large sea that separates Europe from Africa. It stretches from the Atlantic Ocean in the west to Asia in the east. Many early civilizations developed in the Mediterranean region.

Geography

The Mediterranean Sea covers about 970,000 square miles (2,510,000 square kilometers). In the west a narrow waterway called the Strait of Gibraltar connects the Mediterranean with the Atlantic Ocean. The Dardanelles Strait, the Sea of Marmara, and the Bosphorus Strait connect the Mediterranean to the Black Sea in the northeast. In the southeast the Suez Canal links the Mediterranean to the Red Sea. The large islands of

the Mediterranean include Corsica, Sardinia, Sicily, Crete, and Cyprus. The region has mild, wet winters and hot, dry summers.

Some parts of the Mediterranean have their own names. For example, the Aegean Sea lies between Greece and Turkey. The Adriatic Sea separates Italy from the Balkan Peninsula.

Economy

Tourism is a major source of money for many countries around the Mediterranean. Tuna, sardines, and anchovies are valuable fish catches. Some Mediterranean countries produce petroleum (oil) and natural gas.

History

The Egyptians, the Phoenicians, the Greeks, and other peoples created great civilizations in the Mediterranean region in ancient times. They sailed across the sea to trade with other peoples. They also used the sea as a route to expand their territories. The Romans did this for almost 1,000 years, beginning in about

Italy's Amalfi coast looks out onto the Mediterranean Sea.

500 BC. They called the Mediterranean Sea *Mare Nostrum*, which means “our sea.” Beginning in the AD 600s Muslim Arabs began to move from Arabia into North Africa and Spain. In the centuries that followed, the sea continued to serve as a trading route for all the people of the region.

Meiji

The emperor Meiji ruled Japan from 1867 until 1912. When his reign began, Japan was a simple country that kept itself apart from other countries. By the time it ended, Japan was a modern world power.

Meiji was born on November 3, 1852, in Kyoto, Japan. His original name was Sachi No Miya. He was the son of the emperor Komei. As a child, Meiji was called Mutsuhito. At his coronation (crowning ceremony) in 1868, he took the name Meiji, which means “enlightened government.”

At the time when Meiji became emperor Japan was undergoing major changes. In 1854 Japan had opened its borders to the rest of the world for the first time in 250 years. Many leaders and citizens began calling for change.

At the beginning of Meiji’s rule, Japan’s shoguns (mighty warlords) fell from power. They had controlled the country for hundreds of years. Under Meiji,

A priest of the Japanese religion called Shinto blesses children during a festival at the Meiji Shrine. The Meiji Shrine in Tokyo, Japan, was built to honor Emperor Meiji.

however, the emperor became the head of the government.

During his reign Meiji approved many more changes. He made powerful landowners turn over their land to farmers. He ordered a new school system. He also ordered a modern system of government. A new constitution went into effect in 1889. The Japanese Diet, a national assembly, first met in 1890.

In addition, Meiji pushed for a modern army and navy to replace Japan’s traditional warriors, the samurai. During Meiji’s reign, Japan won wars with China and Russia.

Unlike earlier emperors, Meiji allowed the common people to see him. He also wore Western clothing. Meiji died in Tokyo, Japan, on July 30, 1912.

Mekong River

The Mekong is the longest river in Southeast Asia. It flows for about 2,700 miles (4,350 kilometers) through China, Laos, Thailand, Cambodia, and Vietnam.

The Mekong begins at a height of more than 16,000 feet (4,900 meters) in the mountains of Tibet. At first it flows very swiftly through the rugged land of southwestern China. Later in its course the river becomes calmer and wider. It forms the boundary between Laos and

Myanmar and part of the boundary between Laos and Thailand.

Near Phnom Penh, Cambodia, the Mekong is linked to the Tonle Sap, or the Great Lake. During the rainy season the river's swollen waters back up into the Tonle Sap. South of Phnom Penh, the Mekong flows through Vietnam. It eventually empties into the South China Sea south of Ho Chi Minh City.

The Mekong creates a huge delta, or triangular piece of land, in southern Vietnam. The delta has rich soil and is one of the world's great producers of rice. Farmers are able to grow rice even during the dry season because they can use the Mekong's waters to irrigate, or water, their fields.

Melon

Melons are sweet fruits. They have a fragrant, juicy inside that is usually eaten fresh. Melons are a good source of vitamins A and C. Common melons include cantaloupe, honeydew, and casaba. Melons are related to gourds, cucumbers, pumpkins, and squashes. Watermelons also are related, but they are not considered true melons.

Melons originally grew in central Asia. Today people grow them in warm areas throughout the world. Melon plants are annuals. This means that they last for only one growing season. They must be replanted the following year.

A woman rows a boat in the Mekong delta region of Vietnam.

Melons, including cantaloupe and honeydew, are healthy and tasty fruits. Watermelons are related to these fruits, but they are not true melons.

Melon plants are vines that are 7 to 8 feet (2.1 to 2.4 meters) long. The leaves are large and usually rounded. The flowers are yellow and shaped like a bell. They are about 1 inch (2.5 centimeters) across. The fruits differ in size, shape, texture, color, and flavor. They weigh about 2 to 9 pounds (1 to 4 kilograms). Melon plants need a lot of water.

All melons have hard rinds, or skins, that protect the fleshy inside, called the pulp. The pulp can be white, green, or orange. Many seeds grow in the middle of the pulp. People sometimes dry the seeds and eat them as snacks or use them in cooking. A melon must be ripe before it is picked.

Memorial Day

In the United States, Memorial Day honors the memory of soldiers who died in the nation's wars. The holiday falls on the last Monday in May. On Memorial Day, Americans attend parades, church services, and other social events. People also decorate soldiers' graves with flowers and flags. The president of the United States often visits the Tomb of the Unknowns at Arlington National Cemetery. The tomb honors unknown American soldiers who fought for their nation.

Memorial Day began in about 1866, after the American Civil War. People wanted to honor the soldiers who had died in that war's battles. Women's groups began laying flowers on soldiers' graves. Because the day included decorating graves, it was originally called Decoration Day. After World War I (1914–18) the name of the holiday was changed from Decoration Day to

People visit a World War II memorial in Washington, D.C., on Memorial Day.

Memorial Day. For many, the holiday also signals the beginning of summer.

Memory

Memory is the process of storing experiences in the brain and recalling them later. People use their memories during every moment of their lives. They must remember words and ideas to speak or to write. Even to walk or to eat, people remember the movements they learned as children.

Scientists know that memories cause chemical changes in the neurons (nerve cells) in the brain. The chemical changes create what are called memory paths. These paths can remain in the brain for seconds or for a person's entire life.

Levels of Memory

Many scientists believe that there are two levels of memory. One level is short-term memory, or working memory. The other level is long-term memory, or permanent memory.

Short-term memory is a way to store information temporarily. It lasts about 15 to 30 seconds. An example is keeping a telephone number in mind after looking it up and while dialing.

Long-term memory is the storage of information for longer periods. It can last days, months, years, or a lifetime. Repeating and practicing motions or tasks help the brain to store information

Looking at family photographs can bring back happy memories.

for a long time. If a person dials a telephone number many times, the number will move from short-term to long-term memory.

Types of Memory

Scientists also think that there are different types of memory. These include motor-skill, factual, and emotional memory.

Motor-skill memory tells people how to do physical things that they have done before. It can be short-term or long-term. People use motor-skill memory to copy a dance step and to ride a bicycle.

Factual memory is the storage of facts. It can be short-term or long-term. Factual memory lets people remember faces, numbers, and the experiences that happen to them.

Emotional memory is the memory of emotions. It is long-term. For example, people tend to remember very frightening experiences throughout their lives. Some scientists think this happens so

Did You Know?

Some people can memorize what an object looks like after only a glance. This is called having a photographic memory.

that people are prepared for problems in the future.

Remembering

People can pull out information stored in memory through either recall or recognition. Recall means that someone can remember something learned earlier. Recognition is the ability to identify something that has been seen or experienced before. Recognition is easier than recall. It may be easy to recognize a person's face, but it is more difficult to recall the person's name.

Patterns are also easier to remember than random information. For example, it is easier to remember a poem that rhymes than one that does not.

Forgetting

Being unable to remember things is called forgetting. A major reason for forgetting is the passage of time. People also tend to forget things that they do not practice or review. Sometimes a dis-

ease or an injury to the brain can cause people to forget.

In general, people do not like to forget. But forgetting serves some important purposes. The brain forgets information that it no longer needs. Then it may be open to learning new information. Forgetting can also help people to survive painful experiences.

Brain

Meningitis

Meningitis is a disease that involves the membranes, or thin coverings, around the brain and the spine. Meningitis is the inflammation, or swelling, of these membranes. Germs called viruses and bacteria can cause meningitis.

Common symptoms of meningitis are a high fever, a headache, and a stiff neck. People with meningitis also may be tired and have a rash.

Viral meningitis, or meningitis caused by a virus, is usually mild. It often goes away without medical treatment. Bacterial meningitis, or meningitis caused by bacteria, is usually very serious. If not treated right away, bacterial meningitis can cause brain damage, deafness, or death.

The viruses and bacteria that cause meningitis spread easily between people. They can be passed through touching, coughing, or kissing. However, not everyone in contact with the viruses or

Did You Know?

The loss of the ability to remember is called amnesia. Amnesia is usually caused by injury or disease.

Learning to ride a bicycle involves remembering the movements needed to balance, steer, and pedal.

bacteria gets meningitis. Young children and people who are already sick are more likely to get the disease.

There are vaccines, or shots, that can prevent bacterial meningitis. Frequent hand washing also can help to prevent infection by the viruses and bacteria that cause meningitis.

If a person has meningitis, doctors need to find out the cause. They do this by taking fluid from the spine and testing it. People with bacterial meningitis receive a medicine called an antibiotic. With quick treatment, they usually recover. Most people with viral meningitis just need to rest. After several days, they usually feel better.

Mental Illness

When people have a mental illness, or disorder, they cannot control certain feelings, thoughts, or actions. Those unusual feelings, thoughts, or actions often cause problems in their daily life. Some mental disorders are mild and may go away on their own. Others are serious illnesses that require medical treatment.

Types of Mental Illness

Anxiety Disorders

People with anxiety disorders often become afraid, even in safe situations. They may feel helpless, dizzy, or short

People with a mental illness may not be able to control their feelings.

of breath. Sometimes the fear happens for no reason. In other cases the fear is due to a specific thing—for example, heights, crowds, or closed spaces. Anxiety about a specific thing is called a phobia.

Psychotic Disorders

People with psychotic disorders confuse real life with fantasy. They may see or hear things that are not there. They may believe that they are someone else. Schizophrenia is an example of a psychotic disorder. People with schizophrenia do not react in usual ways to conversations or events.

Mood Disorders

People with mood disorders suffer from depression (extreme sadness) or mania (extreme excitement). With depression, people feel sad, hopeless, and tired for an unusually long time. With mania, people feel extremely happy, confident, and energetic. They are often too excited

Did You Know?

In the Middle Ages (AD 500 to 1500) people thought evil spirits caused mental illness.

to think clearly, however, and may make poor decisions.

Mental Disorders in Children

Some mental disorders can begin during childhood or adolescence (the teenage years). Attention-deficit/hyperactivity disorder (ADHD) is the most common one. Children with ADHD may have trouble paying attention in class. They may find it difficult to stay seated for long. ADHD is more common in boys than in girls.

Eating disorders—including anorexia and bulimia—are serious mental illnesses that usually start during adolescence. People with eating disorders, usually girls, have a strong fear of gaining weight. They often think they are fat when they are really thin. People with anorexia eat very little food. People with bulimia eat a lot of food and then make themselves throw up. Eating disorders can cause physical problems and even death.

Causes

Mental illness may be caused by chemical problems in the brain, genetics, environmental factors, or a combination of these things. For example, chemical problems in the brain may cause mood disorders or schizophrenia. Genetics may also be responsible, however: children whose parents have schizophrenia or depression are more likely to have those disorders. Environmental factors—such as child abuse or extreme stress—may add to the likelihood of mental illness. For many mental illnesses, the exact causes are unknown.

Treatment

Psychiatrists are medical doctors who treat the mentally ill. Psychiatrists may prescribe medication to reduce the symptoms of some mental disorders. Some medications are very effective. They allow patients to resume normal lives.

Psychotherapy (often called simply therapy) is another effective treatment for many mental disorders. During therapy, patients talk about their feelings and behaviors with a therapist. Therapists include psychiatrists, psychologists, social workers, and counselors. Therapists help people learn to control the symptoms of their mental disorder.

Did You Know?

Austrian doctor Sigmund Freud helped develop “the talking cure.” Patients talk about their feelings and actions with a therapist.

Children who survived a terrible storm in Indonesia do art therapy. Art therapy can help children to deal with stress. If not treated, extreme stress can cause some types of mental illness.

Mercury

Mercury is one of the planets that orbit, or travel around, the sun in the solar system. It is the closest planet to the sun.

A picture taken from a spacecraft shows the cratered surface of Mercury.

Its orbit, or path, is between the sun and the orbit of the planet Venus. Mercury's average distance from the sun is about 36 million miles (58 million kilometers). It travels around the sun at a faster speed than any other planet.

Physical Features

Mercury is the smallest planet of the solar system. It is less than half the size of Earth. Mercury's diameter, or distance through its center, is about 3,000 miles (4,900 kilometers). It is a solid, rocky planet. Mercury is very heavy for its size. This is because it has a huge core, or center, made of iron.

Mercury's landscape includes flat plains and long, steep cliffs. Its surface is scarred by pits called craters. The craters form when chunks of rock or metal called meteorites hit Mercury. Some parts of the surface have many

craters, while other parts are very smooth.

A thin atmosphere, or layer of gases, surrounds Mercury. It does not keep in heat well. Mercury has daytime temperatures of about 755° F (400° C). However, the temperature may fall to about -280° F (-173° C) before dawn.

Orbit and Spin

Like all planets, Mercury has two types of motion: orbit and spin. Mercury orbits, or travels around, the sun very quickly. It orbits at an average rate of about 30 miles (48 kilometers) per second. Mercury completes one orbit around the sun every 88 Earth days. In other words, one year on Mercury lasts 88 Earth days.

On the other hand, Mercury spins very slowly. The planet takes nearly 59 Earth days to rotate once about its center.

This combination of a fast orbit and a slow spin leads to an unusual situation. A day on Mercury—the time it takes for the sun to appear straight overhead, to set, and then to rise straight overhead again—lasts about 176 Earth days. So on Mercury a “day” is longer than a “year.”

Observation and Exploration

Mercury is so close to the sun that it is difficult to see it well from Earth. Much of the information known about Mercury came from Mariner 10, the first spacecraft to visit the planet. The unmanned U.S. craft flew by Mercury in the 1970s. The United States

launched a second unmanned craft, called Messenger, to Mercury in 2004.

Meredith, James

James Meredith was a leader of the civil rights movement. In 1962 he became the first African American student at the University of Mississippi. His struggle to enter the school made him famous throughout the United States.

James Howard Meredith was born on June 25, 1933, in Kosciusko, Missis-

sippi. From 1951 to 1960 he served in the U.S. Air Force. Then he entered Jackson State College, in Jackson, Mississippi. At that time all schools in Mississippi were segregated by race. This meant that black and white students went to separate schools. Jackson State College had only black students.

In 1961 Meredith applied to the all-white University of Mississippi. It rejected him twice. Meredith then asked the National Association for the Advancement of Colored People (NAACP) to file a lawsuit against the school. In 1962 the U.S. Supreme Court ordered the school to admit Meredith.

But the governor of Mississippi still tried to stop Meredith from attending the school. Violence broke out among people who wanted to keep Meredith out. President John F. Kennedy sent thousands of U.S. soldiers to help Meredith enter the school. Some soldiers stayed to protect Meredith until he graduated in 1963.

Meredith later earned a law degree from Columbia University in New York City. In 1966 he led a march through the South to encourage African Americans to vote. During the march he was shot, but he recovered. In later years Meredith turned away from the civil rights movement.

Did You Know?

Meredith's 1966 march was called the "March Against Fear."

Mesopotamia

Mesopotamia is a Greek name that means “land between the rivers.” It describes an ancient region between the Tigris and Euphrates rivers in the Middle East. Some of the world’s first civilizations developed in Mesopotamia. Today the region is part of Iraq.

Sumer and Akkad

The earliest known civilization started in southern Mesopotamia in about 4500 BC. It was called Sumer. The people of Sumer found that the soil was good for growing crops. Because there was little rain, the people built irrigation systems to carry water from the rivers to their fields. After 4000 BC the world’s first cities began in Sumer. Sumerian cities included Kish, Uruk, Ur, and Lagash. In about 3000 BC the Sumerians created the world’s first writing system, called cuneiform.

North of Sumer was the region called Akkad. Beginning in about 2350 BC an Akkadian ruler named Sargon conquered Sumer and much of the rest of Mesopotamia. This was the world’s first empire.

Babylonia and Assyria

In about 1900 BC people called the Amorites conquered all of Mesopotamia. Under their rule Babylon became the most important city in Mesopotamia. Because the city was so powerful, the whole region became known as Babylonia. The most important Babylonian king was Hammurabi. He is famous for a set of laws made during his reign.

Babylonia began to lose strength after about 1600 BC. The next major power in Mesopotamia was Assyria. In the 1300s BC the Assyrians began to build an empire in northern Mesopotamia and beyond. In 671 BC the Assyrians expanded their rule all the way to Egypt. The Assyrian Empire ended in about 609 BC.

After the fall of Assyria, people called the Chaldeans created a new Babylonian empire. In 539 BC invaders from Persia conquered the Chaldeans. The conqueror Alexander the Great defeated the Persians in about 330 BC. Then Mesopotamia was ruled in turn by the Greeks, Romans, Arabs, and Turks. In 1921 Mesopotamia became the kingdom of Iraq.

Metacom

Metacom was the leader of the Wampanoag, a group of Native Americans. The Wampanoag traditionally lived in what are now Rhode Island and Massachusetts. The English called Meta-

An illustration shows Metacom, who led the Wampanoag against settlers in King Philip's War. It was one of the deadliest wars between settlers and Native Americans.

com King Philip. Metacom is best known for his role in King Philip's War, an uprising against English settlers.

In about 1620 English settlers began occupying the Wampanoag's land. These settlers were the Pilgrims of the Plymouth Colony. Metacom's father, Massasoit, was the chief of the Wampanoag at the time. Massasoit kept peace with the newcomers until his death in 1661. Metacom became chief in 1662. By this time many new settlers were arriving. They wanted to take increasing amounts of the Wampanoag's land without paying for it.

This caused Metacom to ask other tribes to help him fight the English. The battle came to be known as King Philip's War. Metacom proved to be an able military

leader, but after a year of fighting the Indian alliance began to fall apart. Metacom fled to what is now Rhode Island. On August 12, 1676, he was killed by an Indian who was fighting on the English side.

Metal

Metals are a large family of more than 70 chemical elements. Chemical elements are the basic substances that make up the universe. People use metals to make countless things, from toasters to skyscraper buildings.

What Metals Are Like

Metals are usually easy to recognize. Every metal except mercury is solid at room temperature. (Mercury is liquid.) Most metals are gray in color and shiny in appearance. Many metals are quite hard. Metals can be stretched into wire or rolled into sheets. Many metals conduct, or carry, electricity well.

Where Metals Are Found

Living things have certain metals within some of their cells. But the metals that people use to make things are found in Earth's crust. Only gold and a few other metals can be found in pure form. Most metals are always found in the form of chemical compounds. (Chemical compounds are mixtures of two or more

Did You Know?

Ancient peoples used the metals bronze and iron to make tools and weapons.

The metal in a garden chair has been shaped into flower designs. Metals are solid and very strong at room temperature. But when heated, metals become liquid. This makes it easy to form them into different shapes.

chemical elements.) A rock that contains a metallic chemical compound is called an ore.

Extracting Metals

Metallurgy is the science of separating metals from ore and then working with the metals. The first step in producing a metal is to crush the ore into small pieces. The next step is to purify, or clean, the ore.

Metallurgists then take apart the chemical compound that contains the metal. Sometimes they heat the ore so that the chemical elements separate and liquid metal flows out. This process is called smelting. Metallurgists also use electricity and chemicals to separate metal from ore.

Workers then shape the metal. They may shape it by pouring it into a mold, hammering it on a hard surface, rolling it into sheets, or forcing it through openings.

Alloys

Metallurgists sometimes melt metals and mix them together with other metals or with nonmetals. This produces new metals called alloys. Steel is an alloy of iron and carbon. Bronze is an alloy of copper and tin. An alloy has different characteristics than a metal alone. It may be stronger or stand up better to heat.

History

Gold and copper were the first metals to be discovered. Then came silver, lead, tin, iron, and mercury. At first, people simply hammered metals into shape. Then they learned to melt metals and

Giant conveyor belts carry ore, or rock containing metal, that has been dug from the ground. The metal must be separated from the ore before it can be used.

pour them into molds. More than 5,000 years ago, people made the first alloy—bronze. More than 3,000 years ago, people learned to purify iron, which is stronger than bronze.

During the Middle Ages (AD 500–1500) people tried to change lead and other metals into gold. They did not succeed, but they found out many things about metals. Modern scientists have discovered many new metals and have learned to use metals in many new ways.

Metamorphosis

Metamorphosis is a process some animals go through to become adults. It is a series of physical changes. Metamorphosis is especially common in insects. Genes and chemicals called hormones control the process.

Many insects go through four stages of metamorphosis: egg, larva, pupa, and adult. An insect hatches from an egg into a wormlike larva. Caterpillars are examples of insect larvae. The larva eats a lot. As it grows, the larva molts, or sheds its outer covering. To begin the pupa stage, the larva often builds a protective covering, such as a cocoon. Inside this covering the pupa develops wings and adult body parts. It comes out of its covering as an adult.

Beetles, butterflies, flies, and wasps are among the insects with four stages of

Through metamorphosis, a frog develops from an egg to a tadpole and then to an adult.

metamorphosis. Some insects, such as grasshoppers and termites, have fewer stages.

Metamorphosis also happens in animals other than insects. Most amphibians go through metamorphosis. For example, a frog begins life as a tadpole. A tadpole has a short, oval body with a tail. It gradually develops legs and loses its tail to become an adult frog. Starfish, crabs, lobsters, snails, and clams also go through metamorphosis.

Meteor and Meteorite

A meteoroid is a chunk of rock or metal from space that falls through the atmosphere, or layer of gases, surrounding Earth. Most meteoroids burn up in the atmosphere. This creates a bright streak of light called a meteor. Meteors are also called shooting stars. If a meteoroid survives its fall and reaches Earth's surface, it is called a meteorite.

A meteorite formed the huge pit called Meteor Crater in the U.S. state of Arizona.

Almost all meteoroids are formed from material that breaks off objects in space called comets or asteroids. The chunk of rock or metal may enter Earth's atmosphere traveling as fast as 45 miles (72 kilometers) per second. Most meteoroids melt from the heat or break up from the pressure within seconds.

At times people can see thousands of meteors per hour. These meteor showers often occur as Earth passes through the path of a comet. Bits of rock and ice left behind by the comet plunge through Earth's atmosphere, creating meteors.

Occasionally large meteorites strike Earth and create pits called craters. For example, Meteor Crater in the U.S. state of Arizona is 4,000 feet (1,200 meters) across. It was formed when a meteorite crashed into the ground thousands of years ago. Meteorite crashes also make craters on other planets and moons.

Mexican War

From 1846 to 1848 the United States fought a war with Mexico. North Americans now know the conflict as the Mexican War. As a result of the war, the United States took over the land that later became New Mexico, Utah,

Nevada, Arizona, California, Texas, and western Colorado.

Background

In 1845 Mexico and the Republic of Texas both wanted the same piece of land. (At the time Texas was an independent country.) The land they both wanted was north of the river called the Rio Grande. The United States soon joined the quarrel because Texas was about to become a state. Both sides sent soldiers to the area. In May 1846 the United States declared war against Mexico.

War

The United States attacked from several directions. General Zachary Taylor crossed the Rio Grande and won victories in Mexico. In February 1847 he defeated a major Mexican force at the battle of Buena Vista.

General Winfield Scott marched across the Gulf of Mexico area. He captured the important seaport of Veracruz. Scott then marched inland. In September 1847 he captured Mexico City, the capital of Mexico.

Colonel Stephen Kearny easily took New Mexico. Kearny, Commodore Robert F. Stockton, and Lieutenant Colonel John C. Frémont conquered California. In January 1847 the last areas were under U.S. control.

Results

The Treaty of Guadalupe Hidalgo formally ended the war. The United States and Mexico signed it on February 2,

General Zachary Taylor is pictured on a white horse at the battle of Buena Vista during the Mexican War.

1848. The treaty gave the United States more than 500,000 square miles (1,300,000 square kilometers) of Mexican territory—from the Rio Grande west to the Pacific Ocean. The United States paid Mexico 15 million dollars in return.

General Taylor was considered a hero for his actions during the war. As a result he was elected president of the United States in 1848.

Taylor and the U.S. Congress then had to deal with the question of allowing slavery in the new areas. Congress had allowed Texas to have slavery. But in 1850 it let California ban slavery. It gave other territories the right to vote on whether to have slavery. Still, arguments over slavery continued, and both sides grew more apart. The disagreement over slavery finally led to the American Civil War in 1861.

Mexico

Mexico is a large country that sits between the United States and Central America. Mexico has a rich mixture of European and American Indian cultures. The capital, Mexico City, is one of the largest cities in the world.

Geography

Mexico takes up the southern part of North America. It shares borders with the United States, Guatemala, and Belize. The Pacific Ocean lies to the west, beyond a peninsula called Baja California. The Gulf of Mexico and the Caribbean Sea are to the east of Mexico.

Most of the land is a plateau, or raised flat area, surrounded by mountains. The nation's highest peak is a volcano called Citlaltépetl. It rises 18,701 feet (5,700 meters). Near the coasts are low plains. A major river, the Río Bravo del Norte (called the Rio Grande in the United States), forms part of the border between Mexico and the United States.

The remains of the ancient city of Teotihuacán in Mexico include pyramids, temples, and palaces. The city reached its peak in AD 500.

Mexico's climate depends on the height of the land. The lowlands are hot year-round. Temperatures are milder at the middle heights and cold at the highest peaks. Much of northern Mexico is dry. The southern mountains and the coastal plains get the most rain. Earthquakes are common in Mexico.

Plants and Animals

Cacti and yuccas grow in the dry regions. Rain forests and grasslands grow in the south and the east. Some of the mountains have evergreen forests. Mangrove swamps are common on the southern coast.

Monkeys, parrots, and jaguars live in the southern forests. Deer, pumas, coyotes,

rabbits, snakes, and armadillos live in the dry north.

People

More than half of the people in Mexico are mestizos. They have both American Indian and European ancestors.

American Indians form the next largest group. White Europeans form a smaller group.

Most Mexicans are Roman Catholics. The main language is Spanish. More than 50 Indian languages are also spoken. Most Mexicans live in cities.

Economy

Services such as transportation, education, and health care make up a large part of Mexico's economy. Tourism is a major service industry. Millions of tourists visit Mexico's resorts and ancient ruins each year.

Manufacturing and mining are also very important. Factories produce cars, machinery, food and beverages, metals, chemicals, clothing, and other goods. Mexico extracts oil, natural gas, and minerals from the earth. The country is also the world's largest producer of silver.

Agriculture is a smaller part of the economy, but many Mexicans still work as farmers. The major crops include sugarcane, corn, fruits, vegetables, and beans. Cattle and pigs are the main livestock. Logging and fishing also add to the economy.

Members of a Mexican dance company wear colorful costumes. The dance company, called Ballet Folklórico de México, performs traditional Mexican dances.

History

Humans have lived in what is now Mexico for more than 10,000 years. The region's first people were American Indians. They built settlements after they learned to grow corn, beans, and squash. Eventually the Olmec, Maya, Toltec, and Aztec peoples built great civilizations.

Spanish Rule

The Aztec ruled much of Mexico when the Spanish arrived in 1519. Two years later the Spanish soldier Hernán Cortés and his troops conquered the Aztec Empire. Mexico then became part of the Spanish territory known as New Spain. The Spanish forced many Indians to become Christians. They also made the Indians work on plantations and in mines.

The people of Mexico fought against Spanish rule between 1810 and 1815. In 1821 Spain gave Mexico its independence. Mexico was a monarchy until 1823, when it became a republic.

TIMELINE

Spain conquers the Aztec Empire in North America.		Mexico loses land to the United States after the Mexican War.		The Mexican Revolution ends rule of dictator Porfirio Díaz.		Vicente Fox becomes the first non-PRI president in 71 years.
1521	1821	1848	May 5, 1862	1911	1929	2000
	Mexico gains independence from Spain.		Mexico defeats invading French forces.		The political party called PRI takes power.	

Texas and the Mexican War

General Antonio López de Santa Anna became president of Mexico in 1833. He faced trouble in Texas, which then belonged to Mexico. In 1836 the people of Texas rebelled against Mexican rule. Santa Anna tried to stop the rebellion, but he failed.

The United States took over Texas in 1845. That led to the Mexican War between Mexico and the United States. Mexico lost the war in 1848. It gave up a large section of its land to the United States.

French Invasion

Benito Juárez became president of Mexico in 1861. Later that year European powers invaded Mexico to collect money that Mexico owed them. Mexico defeated French forces in a battle that is celebrated today on the holiday Cinco de Mayo. However, France took control in 1864 and ruled until 1867.

Mexican Revolution

The military leader Porfirio Díaz seized control of Mexico in 1876. He ruled as a dictator for 35 years. The Mexican Revolution of 1911 forced Díaz from power. Among the leaders of the revolution were Emiliano Zapata and Pancho Villa. The revolutionary leaders won rights for poor farmers and workers.

Modern Mexico

In 1929 revolutionary leaders formed a political party that became known as the Institutional Revolutionary Party (PRI). The PRI controlled Mexico for the rest of the century. Many Mexicans disliked the PRI's control. In the 1990s rebels in the Mexican state of Chiapas fought against the government for several years. The election of President Vicente Fox in 2000 ended 71 straight years of PRI rule.

Mexico, Gulf of

The Gulf of Mexico is a huge body of water off the southeastern coast of North America. It is almost surrounded by the United States and Mexico. Cuba is to the east. Waterways called straits connect the gulf to the Atlantic Ocean and the Caribbean Sea. The Mississippi River and Rio Grande flow into the gulf.

The gulf greatly affects the climate of the southeastern United States. The winds that blow north across the gulf pick up moisture from it. The moisture

falls as heavy rain along the coast. Hurricanes often hit the coast.

The Gulf of Mexico contains valuable supplies of oil and natural gas. Drilling for oil and gas is a major industry off the coasts of the U.S. states of Texas and Louisiana. Fishing is also important in the gulf. Fishers catch shrimps, flounder, red snappers, mullet, oysters, and crabs. Tourism is another leading industry along the Gulf Coast, especially during the winter.

Mexico City is the capital of the country of Mexico. It is one of the oldest cities in North America. It is also one of the world's largest cities. Mexico City is the center of Mexico's economy and a major center of culture and education.

Mountains surround Mexico City. It lies about 7,350 feet (2,240 meters) above sea level.

Places of Interest

The plaza called the Zócalo is the traditional city center. Many historic build-

Many hotels and tourist sites are located along the Gulf of Mexico.

The Antigua Basílica of Guadalupe stands in Mexico City. A basilica is a type of church.

ings, such as the National Palace, surround the plaza. Several buildings in the area have murals, or wall paintings, by the artist Diego Rivera. In another neighborhood is the former house of the artist Frida Kahlo. It is now a museum about her life.

Many tourists visit an area called Xochimilco to see its “floating gardens.” They are man-made islands on which plants are grown.

Economy

Much of Mexico’s banking and industry takes place in Mexico City. Tourism, insurance, and other businesses that provide services also bring money to the city. Construction is one of Mexico City’s leading industries. Factories in the city make chemicals, plastics, cement, cloth, and many other products.

History

Mexico City has been a large and important capital for hundreds of years. It began in the 1300s, when the Aztec Indians founded a city on the site. They

named their city Tenochtitlán. They ruled a huge empire from there.

The Spanish soldier Hernán Cortés and his troops destroyed Tenochtitlán in 1521. They built a new Spanish city there. Mexico City was the center of Spanish rule in Mexico.

In 1821 Mexico became an independent country. Mexico City became the country’s capital a few years later. In the early 1900s the city was the site of fighting during the Mexican Revolution. A powerful earthquake damaged the city in 1985.

Mexico City grew greatly during the 20th century. In the early 21st century it was among the fastest-growing cities in the world.

Michelangelo

The Italian sculptor, painter, and architect Michelangelo is considered one of the greatest artists of all time. His work stood out even during the Italian Renaissance, a period known for its many outstanding achievements in art.

Early Life and Works

Michelangelo di Lodovico Buonarroti Simoni was born on March 6, 1475, in Caprese, a town near Florence, Italy. When Michelangelo was 13 he studied

Michelangelo's *Pietà* can be seen in Saint Peter's Basilica in Rome.

art with Domenico Ghirlandajo, a leading painter in Florence.

Michelangelo later moved to Rome. There in 1498 he was asked to carve a *pietà*—an artwork that shows the Virgin Mary supporting the body of Jesus after his death. Michelangelo's *Pietà* is a large sculpture carved from one block of marble. It made Michelangelo famous.

In 1501 Michelangelo returned to Florence to create *David*, a huge marble statue of a young man holding a slingshot. David was a king of ancient Israel who is said to have used only a slingshot to kill the giant Goliath. One of the world's greatest statues, *David* represents the Renaissance idea of a perfect human form.

Sistine and Medici Chapels

In 1505 Pope Julius II called Michelangelo to Rome to work on statues for a tomb. In 1508 the pope asked Michelangelo to paint the ceiling of the Sistine Chapel. Over the next few years Michelangelo covered the ceiling with majestic frescoes, or paintings created on wet plaster.

Michelangelo worked perched on a platform about 60 feet (18 meters) above the floor. Most of the time he painted while lying on his back. His paintings covered 10,000 square feet (930 square meters) of the ceiling. The main scenes show biblical stories, such as God creating Adam, and Hebrew prophets.

Michelangelo later returned to Florence, where he designed a marble chapel for the powerful Medici family. The marble statues he carved for the chapel are some of his greatest sculptures.

Later Years

In 1534 Michelangelo started another fresco, the *Last Judgment*, for the Sistine Chapel. He spent most of the rest of his life working on this large painting and writing poetry. He also designed the impressive dome of Saint Peter's Basilica and the Capitoline Square in Rome. However, he did not live to see them completed. Michelangelo died in Rome on February 18, 1564. He was buried in the church of Santa Croce in Florence.

Did You Know?

Michelangelo sculpted *David* out of a nearly ruined block of marble. Another sculptor had already started to carve the marble.

Michigan

The U.S. state of Michigan is believed to have gotten its name from a Native American word meaning “large lake.” Michigan is the only state to border on four of the five Great Lakes. Sometimes called the Great Lakes State, Michigan has more coastline than any state other than Alaska. The capital is Lansing.

Geography

Michigan is located in the north-central United States. It consists of two large pieces of land: the Upper Peninsula and the Lower Peninsula. The Straits of Mackinac separate the two.

The Upper Peninsula extends north and east from Wisconsin. The peninsula is bordered by Lake Superior on the north and Lake Michigan on the south. On the east a river separates the peninsula from the Canadian province of Ontario.

A red lighthouse stands along the pier in Grand Haven, Michigan. Another structure, which houses a light and a foghorn, stands at the end of the pier.

The Lower Peninsula is shaped like a mitten, with the “thumb” on the eastern side. It is bordered on the west by Lake Michigan and on the south by Indiana and Ohio. Two rivers and a lake separate eastern Michigan from Ontario. The peninsula is also bordered on the east by Lake Huron and Lake Erie.

Michigan has two major natural regions. A rugged, forested tableland covers the western half of the Upper Peninsula. The eastern half of the Upper Peninsula and all of the Lower Peninsula are a plains area with some rolling hills.

People

Whites of European heritage account for about four fifths of the population. Most of Michigan’s early settlers arrived in the 1820s and 1830s. During the 1800s many German, Irish, Dutch, Ital-

ian, and Polish people settled throughout the state.

African Americans make up about 14 percent of Michigan's current population. The number of African Americans increased greatly during the 20th century, from about 16,000 in 1900 to more than 1.4 million by 2000. The state has one of the nation's largest Arab American populations. Many Arab Americans live in Dearborn, a city near Detroit.

Economy

Michigan is one of the nation's leading manufacturing states. Its economy is dominated by the automobile industry. The state is home to three major automobile manufacturers: Ford, General Motors (GM), and Daimler-Chrysler.

Michigan is also a major agricultural state. It is best known for its fruit production. Michigan leads the nation in the production of cherries, and it is a

major provider of apples, grapes, pears, plums, and peaches.

Michigan is one of the nation's leading producers of iron ore. Gravel, sand, limestone, petroleum, and natural gas are produced as well.

History

In the 1600s many Native Americans lived in what is now Michigan. Some of the main tribes were the Ojibwa (Chippewa), the Potawatomi, and the Ottawa. The first white settlers were French fur traders and trappers.

The land that is now Michigan became part of a region called the Northwest Territory in 1787. Michigan joined the Union as the 26th state in 1837.

People in Michigan were strongly against slavery. The state therefore had many stopping places on the Underground Railroad. The "railroad" helped slaves in the South escape to the North or to Canada. During the American Civil War (1861–65) many Michigan men served in the Union Army.

In the early 1900s Michigan became the center of the U.S. automobile industry. During World War II (1939–45), the automobile companies built tanks, warplanes, and other machines that were used in the war. Late in the 20th century U.S. cars became less popular with buyers. This hurt the state.

Michigan, Lake

Lake Michigan is the only one of the five Great Lakes that lies entirely within the United States. The others are on the border between the United States and Canada. Lake Michigan's name comes from the Native American word *michigami*, or *misschiganin*. It means "big lake."

Lake Michigan is the third largest of the Great Lakes. It covers an area of 22,300

square miles (57,800 square kilometers). It is bordered by the states of Michigan, Wisconsin, Illinois, and Indiana. Lake Michigan connects with Lake Huron through the Straits of Mackinac in the north. There are a few islands at the northern end of the lake.

Lake Michigan is part of the Saint Lawrence Seaway. This passage connects the Great Lakes with the Atlantic Ocean. Ships carry raw materials and finished goods to and from the great industrial area along Lake Michigan's southern end. The industrial area centers on Chicago, Illinois. Fishing is another important part of the lake's economy.

Popular summer resort areas dot Lake Michigan's shores. Indiana Dunes National Lakeshore and State Park lies along the southeastern shore. It features long beaches and huge sand dunes.

Micronesia, Federated States of

The Federated States of Micronesia is an island country in the western Pacific Ocean. It is made up of more than 600 islands. The capital is Palikir.

The country belongs to the region called Micronesia, which is part of the Oceania region. The country is divided into four states: Yap, Chuuk, Pohnpei, and Kosrae. The largest islands are the peaks of underwater volcanoes. Atolls, or large rings of coral, make up the rest of the land. The climate is hot and humid.

Rain forests grow on the volcanic islands. Coconut, palm, and breadfruit trees grow on the atolls. The country's waters are rich in fish, porpoises, turtles, and giant clams.

The largest group of people is the Chuukese. The Pohnpeians, the Yapese, and the Kosraeans form smaller groups. Nearly everyone is Christian. There are

Fishers use nets in Micronesia.

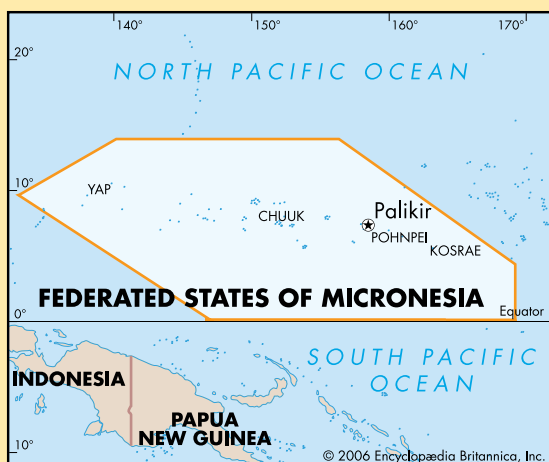

at least eight local languages. English is also common.

The country's economy depends on money from the United States. Most people work for the government or as fishers and farmers. Crops include coconuts, bananas, pepper, and other fruits and vegetables. Tourism is a growing industry.

People came to Micronesia more than 2,000 years ago. Spain made the islands a colony in the late 1800s. Germany, Japan, and the United States all had turns as ruler after the Spanish left.

The Federated States of Micronesia gained independence from the United States in 1986. However, the U.S. military still protects the country.

Microscope

A microscope is a device that magnifies tiny objects, or makes them look larger. People use microscopes to see objects that are too small to be seen with the eye alone. Such objects include cells, tiny living things, and grains of sand.

Optical Microscopes

There are several types of microscopes. Optical microscopes, also called light microscopes, work like magnifying glasses. They use lenses, which are curved pieces of glass or plastic that bend light. The object to be studied sits under a lens. As light passes from the object through the lens, the lens makes the object look bigger.

A special type of optical microscope is a compound microscope. A compound microscope has a light that shines on the object from above or below. A lens near the object makes a larger image (picture) of the object. This lens is called an objective lens. Another lens, known as

Some compound optical microscopes can make objects appear 1,000 times larger than their actual size.

the eyepiece, bends the light again. As a result, the eyepiece forms an even bigger image of the image made by the objective lens.

The size of an image depends on the lenses used. For example, an objective lens might make an object appear 10 times larger than it really is. This lens is said to have a magnification of 10 \times . If the eyepiece also has a magnification of 10 \times , the total magnification of the microscope is 10 times 10, or 100 \times .

The magnification of a compound light microscope can go up to about 1,000 \times . This magnifying power makes it possible

Young students use microscopes to study tiny objects.

to study tiny living things such as bacteria, algae, protozoans, and many types of cells.

Electron Microscopes

To view small objects even more closely, scientists use electron microscopes. These microscopes use beams of electrons instead of light to magnify objects. Electrons are some of the particles, or bits, that make up atoms. Electron beams cannot travel far in air. Objects must be put in a vacuum, or airless space, before they can be seen with an electron microscope.

Electron microscopes can magnify objects up to 1 million times. This magnifying power makes electron microscopes very important scientific tools. However, they cannot be used to study living things because living things cannot survive in a vacuum.

Midas

In ancient Greek and Roman mythology Midas was a king known for his foolishness and greed. Stories about him show the importance of thinking before acting or speaking.

In one story someone named Silenus wandered into Midas' gardens and fell asleep. The palace servants found him and took him to the king. Midas treated Silenus with kindness and helped him get home. Silenus was a friend of the god Dionysus. To reward Midas for

King Midas is a figure from ancient Greek and Roman myths.

helping his friend, Dionysus offered to grant Midas a wish. Without thinking, Midas asked that everything he touch turn to gold. Dionysus made it so.

Midas was thrilled by his new wealth. But he soon realized his mistake. When he tried to eat, his food turned to gold. He knew that he would soon go hungry. Midas asked Dionysus to take the wish back, which he did.

In another tale Midas judged a musical contest between the minor god Pan and the powerful god Apollo. Midas awarded the prize to Pan. In revenge Apollo changed Midas' ears into donkey ears.

Middle Ages

The Middle Ages was the period in European history that came between ancient and modern times. It lasted from about AD 500 to about 1500. The Christian church played an important part in the history of the Middle Ages.

An illustration from a book made in the Middle Ages shows workers building roads outside a town.

Early Middle Ages

The Middle Ages began when Germanic tribes (peoples from northern Europe) invaded the western part of the Roman Empire. The tribes took over the land and formed many small kingdoms.

The invaders also eventually converted to Christianity, which had become the major religion of Rome. The church became the one thing that everyone had in common. The pope was the head of the Christian church. He and other church leaders became very powerful. Few people outside the church could read or write during the early Middle Ages. Religious communities called monasteries therefore were centers of learning.

The most successful king of this period was Charlemagne. He ruled the Franks in the region that is now France and Germany. The pope crowned Charlemagne emperor of the west in 800. However, his heirs were too weak to keep the empire—later called the Holy Roman Empire—in one piece.

From the 800s to the 1000s, Viking invaders attacked many parts of Europe. The Vikings came from what are now Denmark, Norway, and Sweden. They made trouble for many rulers.

During the 1000s, Europeans developed the feudal system to provide security. Landowners called lords built castles. They gave land to followers called knights. In return, the lords called on their knights to defend them in battle. People called serfs or peasants actually

farmed the land. Serfs were not much better off than slaves.

Later Middle Ages

Conditions improved in the 1100s. People learned to grow more nutritious food. Health improved, and the population grew. Towns also grew, and trade increased.

Europeans developed the Gothic style of art and architecture. Christians built stately cathedrals of stone with tall towers and stained glass. Notre Dame in Paris is a good example of a Gothic cathedral. There was also a rebirth of book learning. The first European universities were founded in Bologna, Italy; Paris, France; and other cities.

Between 1095 and 1291, Christian kings and knights from all over Europe participated in a series of Crusades in the Middle East. They went to fight

The Chartres Cathedral in France is an example of Gothic architecture.

Muslims for control of places that Christians consider to be holy.

End of the Middle Ages

The last part of the Middle Ages was a time of trouble. England and France fought the Hundred Years' War between 1337 and 1453. A disease called the Black Death (bubonic plague) killed about one third of the people in Europe between 1347 and 1351.

Various changes led to the end of the Middle Ages. Feudalism weakened as Spain, France, and England became strong countries. Printing was invented in about 1450. This meant that books could be produced easily and in great numbers. Many more people therefore had access to books and could learn to read. Soon the Renaissance, a time of great learning and art, was in progress. Europeans also learned of the Americas in 1492. The discovery led to a new understanding of the rest of the world. It was the first stage of the modern age.

Middle East

The Middle East is the region around the southern and eastern shores of the Mediterranean Sea. It includes the countries that are located where the continents of Europe, Asia, and Africa meet. Geographers and historians do not

Did You Know?

Middle Ages is a term that applies only to Europe. It is usually not used in reference to Asia, Africa, or the Americas.

always agree on which countries should be included in the Middle East. People commonly include the following countries: Turkey, Syria, Lebanon, Israel, Jordan, Iraq, Iran, Afghanistan, Saudi Arabia, Yemen, Oman, the United Arab Emirates, Qatar, Bahrain, Kuwait, Egypt, Libya, and Sudan.

People

Many people of the region are Arabs. Their main language is Arabic. However, many other peoples also live in the Middle East. They speak many different languages. Turks in Turkey speak Turkish. Persians in Iran speak Farsi, or Persian. Jews in Israel speak Hebrew.

Most people in the Middle East follow Islam. But Christianity is common in Lebanon, Egypt, and Syria. Judaism is the main religion in Israel.

Economy

The Middle East contains more than half of the world's petroleum, or oil. The sale of oil has made several Middle Eastern countries very rich. Farming is also important to many countries in the region.

History

Great civilizations arose in the Middle East thousands of years ago. The Egyptian and Mesopotamian civilizations were two of the earliest. (Mesopotamia lay in what is now Iraq.) The powerful Hittite kingdom developed in Anatolia (modern Turkey) after 1900 BC. The ancient region of Palestine was home to the first Jewish state, the kingdom of Israel, about 3,000 years ago.

The Persian Empire ruled much of the Middle East by the 500s BC. The Greeks and the Romans later took control of the region. After the fall of Rome in the AD 400s, the Byzantine Empire ruled the western parts of the Middle East.

Beginning in the 600s, Muslims from the Arabian Peninsula conquered most of the Middle East. Muslim Turks founded the Ottoman Empire in the 1300s. This empire ruled parts of the Middle East into the 1900s.

After World War I (1914–18) European countries took control of much of the

Petroleum, or oil, is treated at a plant in Saudi Arabia. The sale of petroleum is an important part of the Middle East's economy.

area. France controlled Syria and Lebanon. Great Britain ruled over Egypt, Sudan, Palestine, Jordan, Iraq, and southern Yemen. The European powers left the Middle East soon after World War II (1939–45).

The area known as Palestine had long been home to Jews and Arabs. Many of the Arabs were Muslims. The people of Palestine did not agree about who should rule the land. Great Britain helped develop a plan to split the land into two states, one for the Arabs and one for the Jewish people. When the British left in 1948 the Jews declared their part of the land to be the new country of Israel. Israel and its Arab neighbors soon fought a series of wars. Other wars—including a civil war in Lebanon, a war between Iran and Iraq, and the Persian Gulf War—also troubled the Middle East. Fighting in Palestine, Iraq, and other places continued into the 21st century.

Migration, Animal

Many mammals, birds, fish, insects, and other animals move from one place to another at certain times of the year. This movement is called migration. Migration is part of the life cycle of these animals.

Herds of zebras and wildebeests cross a river during their migration.

Animals migrate for different reasons. Many migrate to breed or to find food. Some animals migrate to places where they can hibernate, or rest for the winter. Others migrate because the weather is too hot, too cold, too wet, or too dry during certain times of the year.

Most animals migrate across water, land, or air. Many birds and bats in northern parts of the world fly south for the winter. Some whales swim from cold polar regions to warmer waters in winter. Other migrations are vertical, or up and down. Mule deer in the western United States travel from higher to lower parts of the mountains in winter. Some earthworms move from the top of the soil to deeper underground.

Animals can travel a few miles or several thousand miles. Frogs go short distances to ponds to breed. On the other hand, the Arctic tern spends the summer in the Arctic and the winter in Antarctica. This journey covers about 11,000 miles (18,000 kilometers). Migrations can take place either during the day or at

night. Birds such as geese migrate during the day. Sparrows, warblers, and thrushes travel by night.

Migrating animals can find their way over long and complex routes. They use land features such as rivers and mountains to tell where they are. Scientists think that many animals use the position of the sun and stars to find the way, too. Some animals, such as salmon, use their sense of smell.

► More to explore

Animal • Hibernation

Migration, Human

A long journey to a new home is called a migration. Migrating animals generally go back and forth between summer and winter homes. When people migrate, however, they often are changing homes permanently. Much of human history is the story of migrations.

Kinds of Migration

Some people have no permanent home. Instead, they keep moving from place to place. These people are usually called nomads rather than migrants. Some nomads move back and forth between the summer and winter pasturelands of their animals. Others, such as the Roma (Gypsies), move frequently to find new opportunities. Migrant farmworkers, who move from farm to farm to work, are very much like nomads.

Migration inside a country is known as internal migration. Migration from one country to another is called external migration. A person who moves away from a country is called an emigrant from that country. A person who moves to a country is called an immigrant to the new country.

The promise of good jobs or farmland lures some migrants to a new land. Others want to get away from mistreatment, warfare, or natural disasters in their homeland. Sometimes a government forces people to leave. Migrants who have been forced to leave their country, either by the government or because of harsh conditions, are called refugees.

Captive people have no say in when they leave a country or where they go. The African slave trade was practiced from the 1500s to the 1800s. It brought an estimated 20 million people to North America, South America, and the West Indies. Other captive migrants included criminals who were shipped off to a colony as punishment. European countries transported more than 150,000 convicts to Australia between 1788 and 1867.

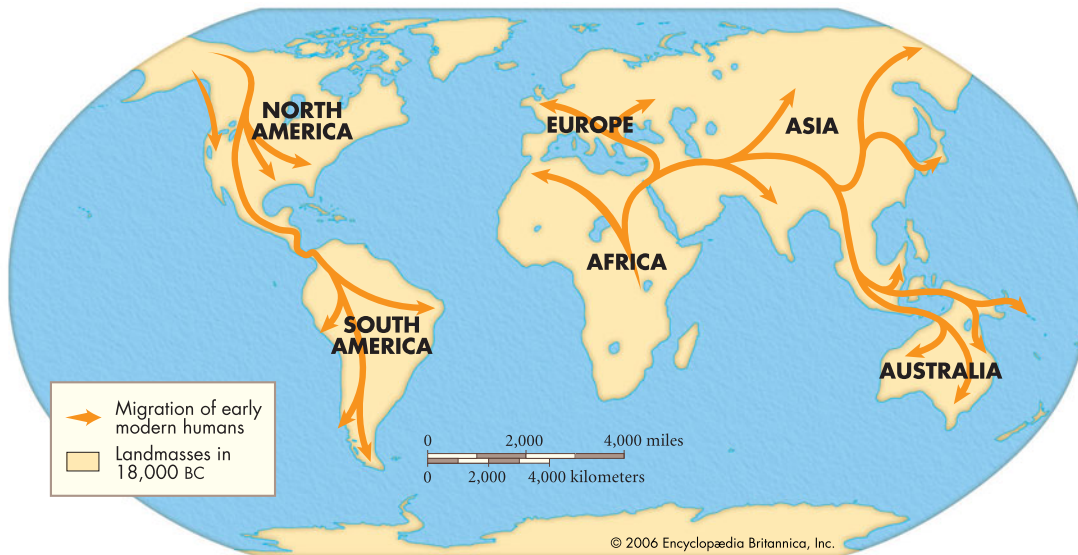

History

Prehistoric and Ancient Migration

Many scientists believe that the earliest humans lived in Africa. From there humans eventually started moving out. They reached Europe and Asia first. From Asia they spread to North America between 60,000 and 20,000 years ago.

Did You Know?

During the 1900s, more than 6 million African Americans moved from farms in the South to cities in the North.

According to many scientists the earliest humans lived in Africa. From there humans spread first to Europe and Asia and later to the Americas.

They may have crossed from Russia to Alaska over a strip of land that is now underwater. Over thousands of years, people spread across North, Central, and South America.

Other prehistoric migrants set out from Asia in boats. They reached Australia about 40,000 years ago. Gradually, they reached all the large islands in the Pacific Ocean. New Zealand was settled last, about 1,200 years ago. Frozen Antarctica is the only continent that migrants never settled.

Later migrations are recorded in history. In one of the earliest historical migrations, the ancient Hebrews moved from slavery in Egypt to freedom in Palestine in the 1200s BC. Later, in the AD 300s and 400s, a number of European tribes invaded the mighty Roman Empire. The invaders, whom the Romans called barbarians, included people called Huns, Goths, and Vandals. In 476 these

migrants brought down the Roman empire in the West.

Migration in the Middle Ages

Wars and conquests made people move during the Middle Ages, from about AD 500 to about 1500. Some peoples fought wars in order to take over new lands. Others were forced from their lands by the invaders. In the 600s armies united by the religion of Islam left the Arabian Peninsula to spread the religion. They conquered northern Africa, western Asia, and Spain. In the 700s a European tribe called the Franks drove the Saxon tribe into northern Europe. Between the 800s and 1000s northern Europeans called Vikings raided and settled in western Europe. Some Vikings who settled in France became known as the Normans. Normans conquered England in 1066. Starting in about 1200, a central Asian people called the Mongols conquered much of Asia and eastern Europe.

Migration to the Americas

The European explorer Christopher Columbus arrived in the Americas in 1492. Migrations from Spain, Portugal, France, England, and the Netherlands followed his voyage. However, the number of immigrants from Europe was small before 1800. The largest immigrant group by far was enslaved Africans. Europeans brought millions of Africans to the Americas.

After 1800, overpopulation, wars, and natural disasters in Europe led to a great migration to the Americas. This was known as the Great Atlantic Migration. Millions of Europeans moved to Canada and South America, but most of the migrants went to the United States.

Germans migrated to Illinois, Missouri, and Wisconsin beginning in the 1830s.

A great number of Europeans, such as this Italian family, migrated to the United States in the 1800s and early 1900s.

A Muslim woman and her children make a new home in Germany.

Norwegians and Swedes arrived in the next few decades in Minnesota, Wisconsin, and the Dakotas. In the 1840s a failure of the potato crop in Ireland brought many Irish people to the United States. Italians, Greeks, and eastern Europeans came later. Between 1880 and 1910 about 17 million Europeans entered the United States.

Early in the 1900s immigration to the United States was so great that the government began setting quotas, or limits. These quotas limited the number of immigrants from specific countries. The United States used these types of quotas until 1965.

Modern Migration

In the late 1900s many people from Latin American countries wanted to move north to the United States. Some crossed U.S. borders without government permission and became illegal immigrants.

Early in the 21st century, Europe had even more immigrants than North

America. Many came from African or Middle Eastern countries. They brought cultural change to Europe.

Meanwhile, the most common kind of migration throughout the world was internal migration, mainly from farming regions into cities. As a result, cities grew very rapidly in much of the world after World War II. This was especially true in developing countries.

Milky Way

The sun and Earth are parts of the Milky Way galaxy.

On a dark, clear night, it is usually easy to see a dusty white band of stars stretching across the sky. This is part of the Milky Way galaxy, a massive collection of stars, dust, and clouds of gas. The Milky Way contains hundreds of billions of stars. It is only one of billions of galaxies in the universe.

The sun is one of the stars in the Milky Way. Therefore, Earth and all the other planets in the solar system are also in the Milky Way. Just as the planets revolve around the sun, the stars in the Milky Way revolve around its nucleus, or center. It takes the sun about 200 million years to travel around the nucleus of the Milky Way.

Viewed from above, the Milky Way looks like a giant pinwheel. The stars are gathered in the flat shape of a disk, and arms of stars spiral out from the nucleus. The nucleus is a bulging cluster of stars. It has a black hole at the center. A black hole is an area with such a strong force of gravity that nothing, not even light, can escape from it.

The sun and its planets are located on the inner edge of one of the Milky Way's arms. The solar system is about 30,000 light-years away from the center of the galaxy. (A light-year is the distance that light travels in one year—about 5.8 trillion miles, or 9.5 trillion kilometers.) The whole galaxy is about 100,000 light-years across.

Millet

Millet is a grain that is an important food in Asia, Russia, and western Africa. Like corn, wheat, and other grains, millet has seeds that can be eaten. Millet belongs to the grass family.

Did You Know?

The black hole at the center of the Milky Way has as much matter as 4 million suns.

People eat the seeds, or grain, of millet plants. Tiny flowers at the tops of the plants produce the seeds.

Millet was probably first grown as a crop in Asia or Africa more than 4,000 years ago. Today India and Nigeria are leading millet-producing countries.

There are several types of millet, including pearl, proso, and foxtail. Most types grow from 1 to 4 feet (0.3 to 1.2 meters) tall and have thin stalks. Pearl millet is an exception. It grows to 10 feet (3 meters) tall and has stalks about 1 inch (2.5 centimeters) thick. Tiny groups of flowers grow at the tops of millet stalks. They produce the seeds, or grain.

People eat millet in porridge, a soft, thick food made by boiling grains in milk or water. Millet can also be prepared and eaten much like rice. People also grind millet into flour for making flatbread. Farmers use millet as food for livestock. Dried millet plants are used for hay. Millet is used in birdseed mixtures, too.

Mimicry

Mimicry takes place when one living thing resembles another kind of living thing. Mimicry helps animals and plants in various ways. It can keep them from being eaten or it can help them get food.

Forms of Mimicry

Mimicry helps protect some types of butterfly in Brazil from birds. These butterflies taste good to birds. However, they have markings similar to those of bad-tasting butterflies. Birds see these markings and stay away.

Sometimes different types of dangerous or bad-tasting living things look like

The fly orchid is a type of plant whose flower looks like a fly. This helps the plant attract real flies to pollinate it.

each other. Sand wasps and yellow jackets are different types of insect. But they look similar, and they both have a painful sting. After an animal attacks one of these insects, it may learn to avoid all similar-looking insects. For this reason, many different stinging insects have yellow and black stripes.

Some animals use mimicry to prey on other creatures. The tongue of the alligator snapping turtle looks like a worm. The turtle lies in water with its mouth open. When fish come over to get the “worm,” the turtle eats them.

Animals may also use mimicry to take advantage of other animals. The eggs of the European cuckoo bird look like the eggs of other birds. A female cuckoo lays her eggs in the nests of these other birds. When the eggs hatch, the other birds care for the young cuckoos.

Plants can use mimicry, too. Passionflower plants sometimes grow little lumps that look like butterfly eggs. These lumps keep butterflies from laying actual eggs on the plants. In this way, the passionflower avoids being eaten by the caterpillars that would develop from the eggs.

How Mimicry Happens

In any group of animals or plants, only some survive and reproduce. Mimicry is a trait that makes survival easier. Therefore, many of those that have such traits do survive, and the traits are passed on to their offspring. After many genera-

tions, the entire population has the useful trait.

Protective Coloration

Mineral

Salt is a common mineral. Salt can be gathered from salt flats, or dried-up lakes where salt has been left behind.

Minerals make up Earth’s rocks, sands, and soils. They are found on Earth’s surface as well as deep underground.

Minerals are inorganic substances, meaning that they do not come from an animal or a plant.

Mineralogy is the science of minerals. Mineralogists, or people who study minerals, have identified about 1,500 minerals. Some of the most common minerals are metals—for example, gold, silver, copper, and platinum. Diamond, quartz, sulfur, mica, talc, and salt are other well-known minerals.

Properties of Minerals

Mineralogists use three main properties to identify a mineral: color, hardness, and cleavage. They may also use other

tests, including how the mineral reacts to electricity or magnets.

Minerals come in many different colors. They also reflect light in different ways. Some are transparent, or see-through. Others are iridescent, which means that their color changes as light hits them from different directions.

Mineralogists describe a mineral’s hardness with the Mohs scale. The scale lists 10 typical minerals, from the softest (talc) to the hardest (diamond). A mineral can be identified by comparing its hardness to the hardness of these 10 minerals.

Mohs Hardness Scale		
	Hardness	Mineral
	1	talc
	2	gypsum
	3	calcite
	4	fluorite
	5	apatite
	6	orthoclase
	7	quartz
	8	topaz
	9	corundum
	10	diamond
Example: A certain mineral can be scratched by topaz but not by quartz. Therefore, it is softer than topaz and harder than quartz. It has a Mohs hardness of between 7 and 8.		

The cleavage of a mineral is the way it splits or breaks. Mica, for example, breaks into thin, flat sheets.

Uses

Animals and plants need minerals to live. For example, humans need the mineral calcium to develop healthy

bones and teeth. Animals, including humans, get minerals from plants or from the milk, eggs, and meat of plant-eating animals. Most plants get the minerals they need from soil.

People also use minerals to make buildings, machines, tools, cleaning products, cosmetics, jewelry, and many other items. Digging useful minerals out of the ground is called mining.

► **More to explore**
Metal • Mining • Rock • Sand • Soil

Minerva

► see Athena.

Mining

Earth’s crust contains many minerals and other materials that are useful to people. To get these valuable natural resources, people must dig into the ground. The holes that they dig are called mines. Some mines are narrow shafts, or tunnels, that go very deep underground. Other mines are large open pits, like canyons. The people who work in mines are called miners.

People dig mines to get such things as diamonds, coal, silver, salt, and many other materials. When a mine provides stone for building, it is called a quarry. Drilling into Earth for petroleum, or oil, is another special type of mining. In this case, the hole in the ground is called a well, not a mine.

Miners drill for gold in a mine in South Africa.

Making Mines

There are many ways to make a mine. One way is by digging underground tunnels. Another way is by removing top layers of soil and rock to create a pit.

Tunnel mines can stretch for miles underground. Sometimes the tunnels open into large rooms. Miners who work deep underground in these rooms use large machines to dig away at the walls. Fresh air, water, and electricity must be lowered down to them from aboveground.

Workers use large earth-moving machines to make pit mines. The machines scrape and dig at the soil until they uncover the minerals. As the machines dig deeper and deeper, they create a huge hole in the ground.

Sometimes miners must use explosives, such as dynamite, to create tunnels or to break up Earth's hard surface. These explosions also break the materials into smaller pieces so that they are easier to collect.

Dangers of Mining

Mining is dangerous work. Tunnel mines can cave in or quickly flood with water. When such disasters happen, miners may be trapped belowground. The explosions used in mining can also release poisonous gases.

History

People have dug mines since prehistoric times. Hundreds of thousands of years ago, during the Stone Age, people dug in the ground to search for flint. Flint is

Miners may go into underground tunnels to dig for ore (rock containing valuable minerals). Or they may dig ore out of large pits in the ground.

Did You Know?

The world's worst mining disaster happened in China in 1942. More than 1,500 miners died.

a stone that can be used to make weapons and tools.

The first metal to be mined was copper. The oldest copper mines are in Egypt. Ancient Egyptians dug these mines about 7,000 years ago. By 5,000 years ago, people were also mining tin and combining it with copper to create bronze. This metal was important for making sturdy, long-lasting weapons and tools. Later peoples mined iron to make even stronger tools and weapons.

The ancient Greeks mined (quarried) marble for many beautiful buildings. The ancient Romans had huge mining operations, many in lands that they conquered. During the 1400s and 1500s the Spanish grew rich by mining gold and silver in the Americas.

The first mining operations in what is now the United States started in the 1700s. Meanwhile, in Great Britain coal mining helped to start the Industrial Revolution. This was a time when people began to use machines to make goods in factories. Coal was an important source of power for operating the machines.

In the 1900s many countries worked to make mining safer for miners. Today many people are concerned about pollution and other damage to the environment caused by mining.

Mink

Mink are mammals with thick, soft fur. People sometimes use the fur to make coats. There are two species, or types, of mink: the European mink and the North American mink. They are related to weasels.

Mink have a slim, long body; a short tail; and short legs. The body of the North American mink is 12 to 20 inches (30 to 50 centimeters) long. Its tail is 5 to 9 inches (13 to 23 centimeters) long. Adults may weigh up to 3.5 pounds (1.6 kilograms). The European mink is smaller. Its body and tail together are about 12 to 15 inches (30 to 38 centimeters) long. Mink fur is normally brown.

Mink live near water. They swim and dive well. Mink are active mostly at night. They hunt fishes, birds, insects, and small mammals. Coyotes, foxes, wolves, and owls eat mink. When a mink feels threatened, it gives off a bad smell.

Minnesota

The U.S. state of Minnesota is sometimes called the Land of 10,000 Lakes. This number is low, however: the state actually has more than 15,000 lakes. These lakes—along with forests, prairies, and a variety of wildlife—make Minnesota a place of great natural beauty.

Minnesota was named after the Minnesota River. The river got its name from a Dakota Sioux Indian word meaning “sky-tinted waters.” The state capital is Saint Paul.

Geography

Located in the north-central part of the United States, Minnesota shares an international border with Canada. The state’s northern border is shaped by the Canadian provinces of Manitoba and Ontario. Minnesota’s other borders are

Lake Superior and Wisconsin on the east, Iowa on the south, and South Dakota and North Dakota on the west.

The Red River of the North flows along the North Dakota–Minnesota border, and the Rainy River separates the state from Ontario. The Saint Croix and Mississippi rivers separate Minnesota from Wisconsin.

Minnesota has two natural regions. The larger region covers the western and central parts of the state. The area contains thousands of lakes and the flat plains of the Red River valley. East of the valley are forests and rolling hills. The other natural region is in northeast Minnesota. This is a forested area of lakes, peat bogs, and ridges. Minnesota is known for its cold winters.

Minneapolis lies along the Mississippi River. It is the largest city in the U.S. state of Minnesota. Minneapolis and the nearby city of Saint Paul form one large urban area.

People

Whites of European descent account for about 90 percent of Minnesota's population. When the first European explorers arrived in the 1600s, they encountered tribes of Dakota and Ojibwa (or Chippewa) Indians. In the mid-1800s, settlers arrived from the eastern United States. Later settlers included immigrants from Norway, Sweden, Finland, and other countries.

African Americans, Hispanics, and Asians each represent about 3 percent of the total population. The state's Native American population (mostly Ojibwa) numbers about 55,000.

Economy

Cropland and pastures occupy nearly half of Minnesota's total land area. The primary agricultural products are corn, soybeans, wheat, and dairy products. Food processing industries pack meat and process dairy products. The manufacture of metal products, machinery, and high-technology equipment are also valuable industries. The Minnesota Mining & Manufacturing Company (also called 3M) is well known for office products such as adhesive tape and notepads.

History

Until the mid-1800s the Ojibwa lived in the north and east of what is now Minnesota. The Dakota lived in the south and west. In the late 1600s, French explorers entered Minnesota. After the French and Indian War (1754–63), Britain gained control of the area. This land

Camping, fishing, and canoeing are popular activities in Minnesota's Boundary Waters Canoe Area Wilderness.

became part of the United States in 1783. Another part of what would later become Minnesota was acquired in the Louisiana Purchase (1803).

Congress created the Minnesota Territory in 1849, and in 1858 the territory joined the Union as its 32nd state. In 1862 the Dakota in the Minnesota River valley began one of the bloodiest Indian wars in U.S. history. The Dakota were defeated and forced to move westward. Settlers poured into Minnesota after the American Civil War (1861–65).

After World War II (1939–45), new industries based on minerals were developed. In the late 20th century Saint Paul, Minneapolis, and Duluth took steps to make their city centers more attractive to people and businesses. These cities became experiments in successful city planning and living.

Minsk

Population
(2005 estimate)
1,765,800

Minsk is the capital of Belarus, a country in eastern Europe. It is the largest city in Belarus. It is also a center of culture, education, and scientific research.

Industry is very important to the economy of Minsk. Some factories in the city make trucks, tractors, refrigerators, and other machines. Other factories make electronics, clothing, and food products. Construction also brings money to the city.

Many times in its history Minsk suffered from wars. Lithuania ruled the city in the 1300s. Poland ruled it in a later period. The Russian Empire took control of Minsk in 1793.

In the early 1900s Minsk and the rest of Belarus became part of the Soviet Union. Minsk became the capital of its region. German forces captured the city in the 1940s, during World War II.

Minuteman

The minutemen were groups of eager young militiamen in Great Britain's American Colonies. A militia is an organized group of citizens who defend a community. The militias of the American Colonies were almost as old as the colonies themselves.

In 1774, as American colonists prepared for war, Worcester County, Massachusetts, reorganized its militia. Some of the militia members were told to be ready to fight "at a minute's notice." They were

A statue in Lexington, Massachusetts, honors the minutemen who fought against the British in 1775.

the first militiamen to be called minutemen. Counties all over Massachusetts soon formed minutemen units.

Paul Revere rode through the Massachusetts countryside on April 18, 1775, to warn the minutemen that British troops were coming. The next morning, when the British attacked, the minutemen of Lexington were ready. They forced the British to flee.

The American Revolution had begun. As the war continued, minutemen units were established in other colonies, including Maryland, New Hampshire, and Connecticut.

Mirage

A mirage is an image that looks real but is not really there. It is caused by layers

of air being at different temperatures and thicknesses. The differences in the layers of air can bend light. This bending, known as refraction, creates false images that people often believe truly exist.

Many mirages are seen around water or hot, flat surfaces. For example, ships may seem to be sailing upside down above the horizon. One of the most common examples of a mirage happens on highways during the summer. A shallow pool of water often seems to be filling the road ahead. The reason for this false image is that a thin layer of heated air forms above the hot black pavement. This hot air meets the cooler air above, and light is bent, or refracted, where they meet. Light refracted from the blue sky looks like water on the ground. The “water” disappears as the observer approaches. A mirage similar to this one can lead people to think they are seeing a pool of water in the middle of a desert.

A mirage in the desert of Namibia leads people to see a pool of water that is not really there.

Mirror

Toddlers enjoy studying their reflection in mirrors.

A mirror is a smooth surface that shows images of the objects near it. Most mirrors are a sheet of glass with a shiny metallic coating on the back.

Reflection

The appearance of an image in a mirror is called a reflection. Reflection happens when light hits a surface. If the light cannot pass through the surface, it bounces off, or reflects. Most surfaces absorb some light and reflect some light. Mirrors, however, reflect almost all the light that hits them. The metallic coating on the back causes the reflection.

When you stand in front of a mirror, your body reflects patterns of light to the mirror. Those patterns of light bounce off the mirror and go back to your eyes. Your brain then interprets, or reads, the patterns of light as an image of yourself in the mirror.

Types of Mirrors

Most mirrors are flat. They are called plane mirrors. Images in a plane mirror are reversed. For example, if you raise your right hand while looking in a mirror, you will appear to raise your left hand. People use plane mirrors to check their appearance.

Other mirrors are curved. Convex mirrors curve outward, like a dome. They make objects appear reversed and smaller than their actual size. Concave mirrors curve inward, like a bowl. At a distance, they make objects appear upside down. Nearby, however, objects appear right side up and larger than their actual size.

How Mirrors Are Made

Mirrors are made in factories with special machinery. First, a sheet of glass is polished smooth and cleaned. Next, the back of the glass is covered with a thin layer of silver, aluminum, or another metal. Then the metal is covered with copper, varnish, or paint to protect it from scratches.

Missions, Spanish

Spanish missions were religious communities in North America. They were set up by missionaries from Spain during the 1500s to the 1800s. Missionaries are people who try to spread their religion.

Did You Know?

Only a few animals, such as chimpanzees, can figure out that their reflection in a mirror is not another animal.

The Spanish missionaries wanted to get Native Americans to practice Roman Catholicism (a branch of Christianity practiced in Spain).

The Spanish built missions in what are now Florida, Texas, and other parts of the U.S. Southwest. Beginning in 1769, they built 21 missions in what is now California. The Spanish priest Junípero Serra set up the first California mission at the Spanish settlement of San Diego.

The typical California mission was a large, square area enclosed by stone walls. A mission’s church rose high above the walls. Its giant bells signaled people to work or to pray.

Many Native Americans lived in or around the missions. Some converted to Catholicism. They tended crops and did other work for the missions. But other Native Americans refused to convert. Some fought the Spanish. Many died from diseases brought by the Spanish.

Mexico (which included California) won independence from Spain in 1821. Mexico ended the mission system and promised to give part of the mission lands to Native Americans. However, ranchers and other Mexicans took over many of the lands.

Mississippi

The U.S. state of Mississippi got its name from a Native American word meaning “great waters” or “father of waters.” The water described is the great Mississippi River, which forms the state’s western border. Mississippi’s nickname is the Magnolia State. The capital is Jackson.

Geography

Mississippi is located in the southeastern United States. The Mississippi River separates western Mississippi from Louisiana and Arkansas. Louisiana also borders Mississippi on the southwest. To the east is Alabama and to the north is Tennessee. The Gulf of Mexico lies to the southeast.

Mississippi is a low and fairly flat state. It has two major natural regions: the Mississippi floodplain and the coastal plain. The Mississippi floodplain, along the western edge of the state, was built up by silt carried downstream by the Mississippi River. The coastal plain covers most of the state and consists of smaller regions of hills and plains.

People

Early settlers in Mississippi were French and Spanish. In the late 1700s and early 1800s the region was populated by English, Irish, and Scottish settlers. Today whites of European descent make up about three fifths of the population. About one third of the people are African Americans. Hispanic Americans, Asians, and Native Americans make up smaller groups.

Economy

Mississippi’s soil and climate are well suited for farming. Cotton and soybeans

are primary crops. Chickens and cattle are the most important livestock. Shrimp and catfish are valuable. The shrimp are caught in the gulf, but most of the catfish are raised in artificial ponds. The state's many forests provide trees for wood products such as lumber and furniture. Other major areas in Mississippi's economy include government operations, social services, commercial trade, banking, real estate, construction, and trucking.

History

The Choctaw were the largest Native American tribe living in the Mississippi area before Europeans arrived. Spanish explorer Hernando de Soto visited the region in 1540. In 1682 the French explorer Sieur de La Salle claimed the territory for France. The first permanent European settlement was built in 1699.

By 1812 the United States had obtained all of the land that forms present-day Mississippi. Mississippi joined the Union as the 20th state in 1817. The years after 1820 were marked by the creation of the cotton plantation system. This consisted of large farms called plantations that depended on slave labor to keep operating. In 1861 Mississippi withdrew from the Union because its leaders were afraid the government would outlaw slavery. Mississippi joined other Southern states in forming the Confederate States of America.

The American Civil War (1861–65) turned Mississippi into a battlefield. One of the state's harshest battles was

A home built in the 1800s (right) and a Presbyterian church stand side by side in Biloxi, Mississippi.

fought at Vicksburg in 1863. After the Confederacy's defeat, Mississippi was readmitted to the United States in 1870.

Like many other states, Mississippi experienced racial problems. Despite the end of slavery, African American residents were denied some of the opportunities available to whites. The civil rights movement of the 1960s made an impact on Mississippi and helped to change the way African Americans were treated.

New industries developed in Mississippi during the last quarter of the 20th century. The state made significant economic progress in the 1990s. Average incomes grew and the poverty level dropped. Nevertheless, Mississippi remained one of the poorest states in the nation in the early 21st century.

Mississippian Culture

In about AD 800 groups of Native Americans developed a culture along the Mississippi River and in what is now the southeastern United States. This Mississippian culture is best known for building mounds of earth. The culture ended by about 1700, but many of the mounds still stand.

The Mississippians lived in both large and small communities. Chiefs ruled towns or regions, called chiefdoms. The chiefs were also religious leaders. Chiefdoms had contact with each other through wars, trade, and alliances.

The people were mainly farmers who grew corn and other crops. They also produced pottery and detailed carvings. They used stone, shell, wood, and copper to make headdresses, masks, weapons, and other items.

Every Mississippian chiefdom had one or more mounds of earth, usually at the center of town. Some mounds were small and round. Others were large pyramids or platforms. The chief's home always sat at the top of a mound.

The largest Mississippian mound is Monks Mound, which is a part of the Cahokia Mounds in southern Illinois. Monks Mound measures about 1,000 feet (300 meters) long and 700 feet (200 meters) wide. It stands about 100 feet (30 meters) high.

Mississippians made gorgets, or jewelry that hangs around the neck, from shell.

The Mississippian culture had already begun to weaken when European explorers arrived in the 1500s. Many Mississippians then died of diseases brought by the Europeans. The last people of the Mississippian culture were probably the Natchez.

Mississippi River

The Mississippi is North America's longest river. Native Americans gave the Mississippi its name, which means "father of waters." The writings of Mark Twain have made the river a part of U.S. legend.

Geography

The Mississippi River begins at Lake Itasca in northern Minnesota and flows south, passing Saint Paul, Minnesota. Near Saint Louis, Missouri, the Missis-

issippi is joined by the muddy Missouri River. Farther along, at Cairo, Illinois, the Mississippi meets the mighty Ohio River. The Mississippi flows into the Gulf of Mexico near New Orleans, Louisiana.

The Mississippi River alone is 2,350 miles (3,780 kilometers) long. If the length of the Missouri River system is added, the Mississippi flows for 3,710 miles (5,971 kilometers). By that measure, the Mississippi is the world's fourth longest river.

Animals

Millions of ducks, geese, and swans move along the Mississippi during their spring and autumn migrations. The path they follow is called the Mississippi Flyway. Common fish in the river include catfish, walleye, and carp.

Economy

The Mississippi River has a long history of trade. Today it is one of the busiest commercial water routes in the world. Products shipped on the river include oil, coal, iron, steel, chemicals, and grain from Midwestern farms.

A tugboat pushes barges on the Mississippi River in Louisiana. Barges are boats that carry goods along rivers and other waterways.

History

The first European to explore the Mississippi was Hernando de Soto of Spain. He entered the river from the Gulf of Mexico in 1541. The French explorers Jacques Marquette and Louis Jolliet traveled part of the way down the river in 1673. Another French explorer, La Salle, reached the mouth in 1682. He claimed the entire Mississippi region for France. In 1803 France sold the land to the United States in the Louisiana Purchase.

Missouri

The Missouri were a Native American people whose homeland was the north-central part of what is now the state of Missouri. The state takes its name from these people.

The Missouri got their food by farming, hunting, and gathering wild plants. After the fall harvest they left their villages to hunt deer. When they were introduced to horses the Missouri used them to travel to the Great Plains to hunt bison (buffalo).

The Missouri were once part of a large Native American group called the Winnebago who lived in the Great Lakes region. Long ago a group of these Indians moved southwest and split into three tribes. These were the Oto, the Iowa, and the Missouri.

Leaders of the Missouri people wore necklaces made from beads and bear claws.

In 1673 French explorers entered the lands of the Missouri. The Missouri became trading partners of the French. In the late 1700s and early 1800s, wars with other tribes caused the Missouri to scatter. Many settled among their Oto and Iowa relatives.

In 1817 and 1854 the U.S. government forced the Missouri and the Oto to sign agreements to give up most of their land. In the 1880s they were forced to move to a reservation in Indian Territory (now Oklahoma). There they became known as the Otoe-Missouria Tribe of Oklahoma. By the end of the 20th century there were about 1,500 Otoe-Missouria in the United States.

Missouri

The U.S. state of Missouri got its name from a Native American tribe that once lived in the area. The French gave the name to the local river, and it was later transferred to the state.

Missouri is often called the Show Me State. The nickname probably came from Congressman Willard D. Vandiver. In an 1899 speech he said, “I’m from Missouri, and you’ve got to show me.” The state capital is Jefferson City.

Geography

Missouri is nearly in the center of the United States. Eight states border Missouri: Iowa on the north; Nebraska, Kansas, and Oklahoma on the west; Arkansas on the south; and Tennessee, Kentucky, and Illinois on the east. The Missouri River forms the northwest boundary, while the Mississippi River runs along the eastern border.

Saint Louis, Missouri, is famous for its Gateway Arch. The arch was built in the early 1960s. It is a monument to the people who used Saint Louis as a starting point for exploring and settling the western United States.

North of the Missouri River, the state’s landscape consists of gently rolling hills, open plains, and prairie country. South of the river the land is mostly rough and hilly. The state’s southeastern corner is part of the Mississippi River floodplain.

People

White people of European heritage now make up more than four fifths of Missouri’s population. Many early settlers in the state were from the eastern United States. Others were immigrants from European countries such as Germany, Great Britain, and France. About 11 percent of the current population is African American.

Economy

Missouri is known as a manufacturing state. Major manufacturing areas include transportation equipment and food processing. Cars, trucks, and airplanes are all built in the state. Hallmark Cards, the company that creates greeting cards, has its headquarters in Kansas City. Service industries such as government operations, real estate, commercial trade, health care, and finance are vital to the state's economy. Leading agricultural products are cattle, hogs, soybeans, and corn.

History

Native Americans of the Fox, Sauk, Missouri, and Osage tribes lived in the area when European explorers first arrived. In 1682 the French explorer called the Sieur de La Salle claimed the area for France. The first permanent white settlement was established in 1735.

In 1803 the United States purchased a large area from France. It was known as the Louisiana Purchase. The region that is now the state of Missouri was part of that area. In 1804 the city of Saint Louis was the starting point of the famous Lewis

and Clark Expedition. The expedition was sent out to explore the area of the Louisiana Purchase. Missouri became a territory in 1812 and a state in 1821.

When Missouri wanted to become a state it faced a problem because of the issue of slavery. People in the territory owned slaves. Therefore Missouri would be a slave state. Some people in the United States Congress did not want Missouri to become a state because there were an even number of slave and free states at the time. The problem was solved by a law known as the Missouri Compromise. The compromise was this: Missouri would join the Union as a slave state and Maine would enter as a free state.

Although Missouri was a slave state, it did not join the Confederacy with other slave states during the American Civil War (1861–65). Federal troops were brought in to make sure that Missouri remained in the Union.

In 1904 the state hosted a world's fair called the Louisiana Purchase Exposition. It marked the hundredth anniversary of the purchase. The state remained mostly rural until the early 1940s. During World War II (1939–45) manufacturing grew in the state. This led many people to leave farms and towns for cities. Gradually, manufacturing and service industries became the most important parts of Missouri's economy.

Missouri Compromise

Congressman Henry Clay came up with the idea for the Missouri Compromise.

The Missouri Compromise was an agreement passed by the U.S. Congress in 1820. It allowed Missouri to become the 24th state in the United States. It also began the conflict over the spread of slavery that led to the American Civil War (1861–65).

In the early 1800s Missouri was still a territory. In 1818 it applied to Congress to become a state. At that time there were 11 free states and 11 slave states in the United States. The admission of Missouri as a slave state would upset the balance of states.

In 1819 Maine also applied to be a state. Henry Clay, a member of Congress

from Kentucky, then came up with a compromise. Congress agreed to admit Maine as a free state and Missouri as a slave state. The compromise also banned slavery from any future territories or states north of the southern border of Missouri.

The Missouri Compromise stayed in effect for more than 30 years. It was broken by the Kansas-Nebraska Act of 1854, which allowed slavery north of the Missouri Compromise line.

Missouri River

The Missouri River flows for 2,315 miles (3,726 kilometers) through the central United States. It is nearly as long as the Mississippi River, which it joins at its mouth. Together the Missouri and the Mississippi form a river system that is 3,710 miles (5,971 kilometers) long. Only three rivers in the world are longer.

The Missouri River begins in the Rocky Mountains of southwestern Montana. It

The Missouri River winds through a canyon in Montana.

first flows north and then turns eastward. It passes through or along the borders of North Dakota, South Dakota, Nebraska, Iowa, Kansas, and Missouri. It meets the Mississippi River just north of Saint Louis, Missouri.

The Missouri once carried a huge amount of soil all through its course. It was called the Big Muddy because of its brown water. Today, however, dams trap much of the soil in the upper part of the river. The lower part of the river is cleaner.

Barges pushed by tugboats move cargo on the Missouri River between Sioux City, Iowa, and the river's mouth. Dams keep barge traffic from going farther north than Sioux City. The barges carry corn, soybeans, and wheat from farms in the area.

The first Europeans to see the mouth of the Missouri were the French explorers Jacques Marquette and Louis Jolliet, in 1673. French fur traders traveled upstream in the 1700s. The United

States bought almost all the land drained by the Missouri from France in 1803. The U.S. explorers Meriwether Lewis and William Clark traveled up and down the river during their famous expedition of 1804–06.

Miwok

The Native Americans known as the Miwok (or Mewuk) traditionally lived in central California. There were several different groups of Miwok. The largest group was the Sierra Miwok, who lived in the western foothills of the Sierra Nevada mountains. The Sierra Miwok had more than 100 villages when Europeans arrived in their territory.

The Miwok lived in large, earth-covered houses. Some Miwok also made simple shelters called lean-tos from bark. The Miwok fished and hunted birds, deer,

A Southern Miwok woman holds up a sifting basket in about 1924.

and other game with bows and arrows. They also gathered nuts, berries, and roots.

By the early 1800s Spanish priests and soldiers had started to build missions in Miwok territory. The Spanish forced some Miwok to live and work at the missions. In addition, Russian traders who came from the north sometimes attacked the Miwok.

In 1848 gold was discovered in California. Gold-seeking Americans rushed to California and took over Miwok lands. The settlers killed many Miwok.

The surviving Miwok scattered. Without land, many gave up their old way of life. They moved from place to place looking for work, often on farms or ranches. At the end of the 20th century there were about 3,000 Miwok.

Mockingbird

Mockingbirds are songbirds known for imitating the songs of other birds. The common, or northern, mockingbird may learn the songs of more than 30 other kinds of birds. It may also imitate such sounds as the cackling of a hen or the barking of a dog. Mockingbirds sing their own musical songs, too.

Mockingbirds live in bushy areas and suburbs in the Americas. The common mockingbird is found in the United States and Mexico. The blue mocking-

A common mockingbird perches on a cactus in the U.S. state of Texas.

bird lives in Mexico. Several other species, or types, of mockingbird live in Central and South America.

Mockingbirds are medium-sized birds with slim bodies and long tails. They are mostly gray or brownish. Common mockingbirds are about 10.5 inches (27 centimeters) long.

The bill of a mockingbird is strong and slender, with a slight downward curve. Mockingbirds use their bills to eat insects, seeds, and berries.

Mockingbirds strongly defend their territory. In fact, many types will attack dogs, cats, or even humans whom they see as a threat.

Mogadishu

Mogadishu is the capital of Somalia, a country in northeastern Africa. It is the country's largest city. It is also a major port on the Indian Ocean. Mogadishu is an ancient city that enjoyed wealth and power long ago. But it was seriously damaged during a civil war in the late 20th and early 21st centuries. The war also hurt the city's economy.

Arab settlers founded Mogadishu in the 900s. It grew into a wealthy trading city.

In the 1500s Mogadishu began to decline. Rulers from local kingdoms took control of the city.

Italy took over Mogadishu and the surrounding area in the late 1800s. The city later became the capital of the colony called Italian Somaliland.

In 1960 Somalia became an independent country with Mogadishu as its capital. Different groups began fighting for control of Somalia in the 1990s. Much of the fighting took place in Mogadishu.

Mohawk

The Mohawk were one of the five original Native American tribes of the Iroquois Confederacy. The confederacy was a group of tribes that lived in upper New York State and spoke similar languages. The Mohawk originally lived in what is now the Mohawk River valley.

Like the other Iroquois tribes, the Mohawk lived in longhouses. Longhouses were large, barn-shaped homes made from wooden frames covered with bark. A longhouse was big enough to house several families. The Mohawk grew corn, beans, and squash. They fished in the summer and hunted in the fall and winter.

In the early 1600s Europeans from England and the Netherlands began arriving in Mohawk territory. The

Did You Know?

During the 1900s, Mohawk men became famous for their skill as construction workers on skyscrapers.

Despite a civil war, children still go to school in Mogadishu, Somalia.

Joseph Brant was a Mohawk chief who supported the British during the American Revolution.

Mohawk traded furs with them for metal tools, guns, and other goods. In the 1630s and 1640s smallpox and other diseases brought by the Europeans killed two thirds of the Mohawk.

During the American Revolution (1775–83) Mohawk warriors helped English troops fight the American colonists. When the Americans won the war, some Mohawk moved to Canada. In the early 21st century thousands of Mohawk people lived in the Canadian provinces of Quebec and Ontario. Others lived in the U.S. state of New York.

• Native Americans

Mohegan

The Mohegan are a Native American people who originally lived in what is now eastern Connecticut. When English settlers arrived in their territory the

Mohegan became friends of the settlers. Because of this the Mohegan became the most powerful tribe in southern New England in the late 1600s.

The Mohegan lived in dome-shaped homes called wigwams. They fished, farmed, and hunted. The Mohegan's most important crop was corn. They also grew beans and squash.

In the early 1600s European settlers began arriving in New England. At the time the Mohegan were under the control of Sassacus, a chief of the neighboring Pequot tribe. The Mohegan eventually rebelled against Sassacus and became independent. The leader of the rebellion was named Uncas. He made the Mohegan tribe stronger by forming an alliance with the English.

In 1637 English settlers started a war against the Pequot. Most of the Pequot were killed. The Mohegan took over most of the Pequot lands. The Mohegan

A large boulder called Cochegan Rock is important to the Mohegan people. It is thought to be where the leader Uncas held tribal councils, or meetings. It is located in the eastern part of the state of Connecticut.

grew even more powerful after the English nearly destroyed neighboring Native American tribes in King Philip's War (1675–76).

Despite their success the Mohegan population declined. Many of the Mohegan began dying of diseases brought by the Europeans, such as smallpox and measles. In addition, English settlers turned on their former allies and took the Mohegan's land. At the end of the 20th century there were only about 1,100 Mohegan living in the United States.

Mohican

The Mohican (or Mahican) are Native Americans who originally lived in what is now northern New York State. Their land ran along the Hudson River. Today most Mohican live in northeastern Wisconsin.

The Mohican traditionally lived in rectangular, bark-covered homes called longhouses. Longhouses were big enough for several families. Groups of longhouses made up villages. Some villages were protected by stockades, or fences of sharp stakes.

The Mohican grew corn, beans, and squash. They gathered wild plant foods, including the sweet syrup of the maple tree. They also hunted and fished.

The Mohican used stones to grind corn into meal.

Dutch traders came to Mohican lands in the early 1600s. The Dutch became allies of the Mohawk, who were enemies of the Mohican. The Mohawk got guns from the Dutch and forced the Mohican from their homeland. Many Mohican joined other tribes. One group of Mohican moved to what is now Stockbridge, Massachusetts. They became known as the Stockbridge Indians.

The Stockbridge fought with the Americans in the American Revolution (1775–83). But after the war the U.S. government let settlers take over the tribe's territory. The Stockbridge moved west. Eventually they settled in Wisconsin. There they were joined by the Munsee, a group of Delaware (Lenni Lenape) Indians. In 1856 the U.S. government gave the Stockbridge and Munsee Indians a reservation in Wisconsin. At the end of the 20th century more than 2,300 Stockbridge-Munsee lived in Wisconsin.

Moldova

Moldova is a small country in eastern Europe. Its capital is Chisinau.

Geography

Moldova is in the northeastern corner of the Balkan Peninsula. Ukraine and Romania surround the country. The land is a hilly plain with rich, black soil. Moldova has warm summers and mild winters.

Plants and Animals

Forests cover northern and central Moldova. Wild boars, hares, wolves, foxes, badgers, wildcats, and deer live in the forests.

People

Moldovans make up about half of the country's population. Other groups include Ukrainians, Russians, Bulgarians, Roma (Gypsies), Gagauz (a Turkic people), and Jews.

Grapevines grow near Tiraspol, Moldova.

Economy

Agriculture is important to Moldova's struggling economy. Sugar beets, wheat, corn, grapes, sunflower seeds, and tobacco are the leading crops. Sheep, pigs, and cattle are the main livestock. Moldova's industries process many farm products, including wine, sugar, dairy products, meat, and fruit. Factories also make tractors and clothing.

History

Moldova was originally called Bessarabia. In the 1400s it joined Moldavia, a region that later became the country of Romania. In 1940 the Soviet Union took Bessarabia from Romania. It made Bessarabia the Moldavian Soviet Socialist Republic. In 1991 the republic gained independence as Moldova.

Mole

Moles are small mammals that are known for digging tunnels. There are more than 40 species, or types, of mole. They can be found in Europe, Asia, and North America.

A mole's wide, flat front feet and sharp claws help it dig through soil.

Most moles are built for digging. Their bodies are cylindrical, or tube-shaped, and they generally have short tails. They range in length from about 1.2 inches (3 centimeters) to almost 9 inches (22.5 centimeters) without their tails. The head is flat and pointed, and the nose is long and piglike. They have hairs on their noses and tails that are very sensitive. These help to guide them through the darkness. Moles have short front legs with wide, flat feet. The feet have five toes, each with a long, sharp claw.

Moles make tunnels by “swimming” through the soil. They push their feet forward and then out to the side, moving the dirt back. Moles sometimes make two separate tunnels. Tunnels just under the ground are for feeding and resting. Some moles also dig deeper tunnels about 10 feet (3 meters) underground. These lead to the mole's home. In digging these deep tunnels, moles

push up the dirt, making little hills above ground called molehills.

Some moles spend time aboveground or in water. These include shrew moles and moles called desmans.

Moles have big appetites. Most moles eat earthworms, insects, and other foods that they find while traveling through their tunnels.

Mammal

Molecule

A molecule is the smallest unit of a substance that has all the properties of that substance. For instance, a water molecule is the smallest unit that is still water. A water molecule can be divided into tiny parts called atoms. This produces two hydrogen atoms and one oxygen atom. But these atoms alone do not have the properties of water.

Molecules and Elements

The chemical elements are the substances of which all matter is made. That is, everything in the world is

A water molecule contains two atoms of hydrogen (H) and one atom of oxygen (O). Scientists have different ways of drawing molecules to show how they are made.

Did You Know?

A molecule is constantly in motion. Its atoms rotate and vibrate around one another.

either a pure element or a combination of two or more elements. The molecules of pure elements contain only one type of atom. For example, the molecules of the element iron consist only of iron atoms.

A few elements have molecules that are made of a single atom. For instance, a molecule of helium gas consists of one helium atom. But most elements have molecules that contain at least two atoms joined together. For example, a molecule of oxygen gas consists of two oxygen atoms.

Molecules and Compounds

Other molecules contain atoms of two or more different elements. A substance made of such molecules is called a chemical compound. Water is a chemical compound because its molecules have two hydrogen atoms and one oxygen atom. The sugar called glucose is another chemical compound. Each glucose molecule contains 6 carbon atoms, 12 hydrogen atoms, and 6 oxygen atoms. Some very complex molecules in living cells are made up of hundreds of thousands of atoms.

How Molecules Are Formed

Strong chemical bonds hold the atoms in a molecule together. The bonds are formed when atoms share particles called electrons. Electrons are found either alone or in pairs in the outer part of atoms. When two atoms with unpaired electrons approach each other, the unpaired electrons may form a pair.

Both atoms then share the pair. This holds the atoms together.

Mollusk

A mollusk is a kind of animal with a soft body. Most mollusks have a hard shell that protects the body. There are more than 100,000 species, or types, of mollusk. Octopuses, oysters, snails, and squid are just a few examples.

Where Mollusks Live

Mollusks can be found throughout the world. Most live in the sea, but others live in freshwater. Some like shallow water along the coast. Others prefer deep water. Many mollusks dig into sandy or muddy bottoms. Some attach themselves to rocks.

Some snails and slugs live on land. They prefer cool, moist places. But they also can be found in cold regions and in dry deserts.

Squid are awake and active at night in the water.

Mussels have hard shells with two halves that can close to keep them safe.

Physical Features

Mollusks vary a lot in their features. Even mollusks of the same type can be very different. For example, the giant squid can be more than 60 feet (18 meters) long. But some other squid are less than an inch (2.5 centimeters) long.

Mollusks are invertebrates, meaning that they do not have a backbone. They have a soft body that holds the heart, liver, digestive system, and other important organs. Most mollusks have a mouth structure called a radula. The radula is sort of like a rough tongue with lots of tiny teeth.

A mollusk's soft body has a covering called the mantle. In most kinds of mollusk, the mantle makes a shell. Some mollusks, such as snails, have a single, solid shell. Other mollusks, called bivalves, have a shell with two halves that can close together for protection. Oysters and clams are bivalves. Some mollusks, such as octopuses and squid, do not have a shell.

Most mollusks with shells have a "foot." The foot moves them forward by

expanding and contracting muscles. Some bivalves, however, do not move. They stay attached to rocks or other hard surfaces. Octopuses, squid, and cuttlefish move by forcing water out of a funnel-shaped structure on their body.

Behavior

Many mollusks eat mostly algae. They use the radula to scrape algae off rocks. But larger mollusks have a greater appetite. Snails and slugs eat plants and fruit. Squid may eat fish and shrimp. An octopus can go after prey as large as a shark.

Mollusks usually are active at night. For instance, octopuses stay in the deep parts of the ocean during the day. At dawn and dusk they swim closer to the surface looking for food.

Many mollusks hide from enemies in their shells. But mollusks without shells need other ways to protect themselves. For example, squid and octopuses change color and patterns to blend into their surroundings.

Reproduction

Some mollusks bear live young, but most reproduce by laying eggs. There may be one egg, several eggs, or thousands of eggs. The babies of some mollusks look like small adults when they hatch. Others hatch in a wormlike form called larvae.

Monarchy

A monarchy is a form of government that has a single person known as a monarch at its head. Monarchs use such titles as king, queen, emperor, or empress. Monarchies were once common throughout the world, but now they are rare.

Monarchs generally reign for life. Also, most monarchies are hereditary. This means that when the monarch dies, a son, daughter, or other relative becomes the next monarch. However, some early monarchs were elected. Germany's Holy Roman Empire continued this tradition.

Forms of Monarchy

There are several kinds of monarchy. In an absolute monarchy, the monarch rules with unlimited power. Absolute monarchy is less common today than constitutional monarchy. A constitutional, or limited, monarchy has an elected government that runs the country. The monarch has very little power.

History

Monarchies have existed since people first started forming civilizations. In early times some peoples, such as the ancient Egyptians, saw their monarchs as godlike or as actual gods. Beginning in the 1500s many European monarchs claimed that their power came directly from God. This idea was called the divine right of kings.

By the 1700s, however, more and more citizens had come to see monarchs not

Gyanendra Bir Bikram Shah Dev sits on a special chair after becoming king of Nepal in 2001. The chairs of monarchs are often called thrones.

as divine rulers but as brutal tyrants. In 1776 the American Colonies broke away from the British monarchy. They formed a republic—a country ruled by the people. As more colonies around the world gained independence, they almost always ended up as republics and not monarchies. World War I (1914–18) brought an end to important European monarchies, including those of Russia, Germany, and Austria-Hungary.

Today monarchies survive in the United Kingdom, Spain, Sweden, The Netherlands, Morocco, Jordan, Japan, and several other countries. These are all constitutional monarchies. Stronger forms of monarchy exist in Saudi Arabia and Swaziland.

Monet, Claude

Claude Monet stands beside two of his paintings.

Claude Monet was a French artist known for painting in the style called impressionism. Monet was famous during his lifetime, and his paintings remain popular today. They are on display in art museums around the world.

Claude Monet was born on November 14, 1840, in Paris, France. He drew and painted as a young man. In the 1860s he became friends with other artists, including Pierre-Auguste Renoir. The group of artists became known as the impressionists because of Monet's painting called *Impression: Sunrise*.

Most of Monet's subjects were from nature. Like other impressionists, he was fascinated by the way light and shadows change during the day. He often painted the same scene again and again to show all the variations of light and shadow.

In the 1880s Monet settled in Giverny, outside of Paris. There he painted one of his most famous series of paintings,

called *Water Lilies*. Monet died on December 5, 1926, in Giverny.

Money

Whenever people pay for goods or services, they use some form of money. Money can be almost anything, as long as everyone agrees on its value. One of the earliest forms of money was metal, such as gold or silver. In North America, Native Americans used beads made of shell, called wampum, as a form of money.

How Money Works

People used to pay for things through barter, or trading. But each trading partner had to have something that the other one wanted. And the two things had to be of equal value. Modern living would be impossible under this system.

People invented money to avoid barter. In a money system, a buyer does not

Different countries have different currencies, or kinds of money. The money of the United States is called the dollar.

have to have something that the seller happens to need. The seller will always accept payment in money, because the seller can use the same money later to buy almost anything.

Today the metal coins and pieces of paper that people use for money have little real value. In other words, people do not use the paper for writing or the metal for making tools. The value of paper money and coins comes from an agreement between all people. They agree that they will accept certain forms of money in exchange for their goods and services. This agreement between people is the reason money works.

History

People have used money for more than 4,000 years. In the 600s BC the kingdom of Lydia in what is now Turkey began to make coins. It was probably the first government to do so. These coins were a combination of silver and gold, called electrum. Many ancient peoples, including the Greeks and the Romans, also used coins.

The first types of paper money were used in China more than 1,000 years ago. Early paper money was simply a written promise to pay a certain amount of gold or silver money. The paper money was valuable because it could be traded for gold or silver. Later, governments began printing paper money. In the 1900s most governments made paper money valuable on its own. It no longer stood for gold or silver. Today

people often exchange money electronically, through computers.

Trade

Mongol Empire

The Mongol people were a group of tribes from the grasslands of central Asia. In the early 1200s a warrior named Genghis Khan united the tribes and built a mighty empire. At the height of its power, the empire stretched from what are now China and Korea to eastern Europe.

Genghis Khan

The Mongols' homeland lay in what are now Mongolia and northern China. Mongol tribes raised animals and moved from place to place. The tribes sometimes banded together in groups. Near the end of the 1100s, a leader named Temüjin took control of a group called All the Mongols. In 1206 he took the title of Genghis Khan, which means "universal ruler."

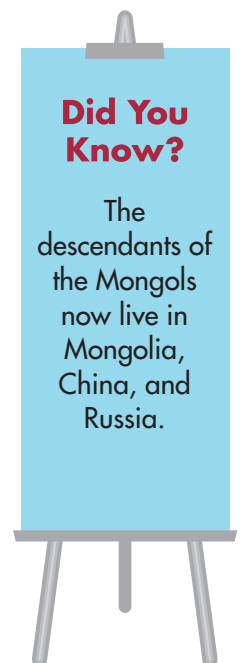

People across Asia feared Genghis Khan's armies. His soldiers rode horses and fought with bows and arrows. By 1215 the Mongols had taken northern China. When Genghis Khan died in 1227, the Mongols controlled land from the coast of China all the way to European Russia.

After Genghis Khan

Genghis Khan's sons and grandsons continued to build the empire after his

Did You Know?

The descendants of the Mongols now live in Mongolia, China, and Russia.

death. One of his grandsons, called Batu Khan, led a Mongol group called the Golden Horde. The Golden Horde moved west from Russia into Hungary.

In 1251 Möngke, another grandson of Genghis Khan, became khan, or ruler of the Mongol Empire. Möngke's armies conquered Persia (Iran) and Iraq. Only defeat by an Egyptian army kept them from moving farther west.

In 1260 Möngke's brother Kublai, also a grandson of Genghis Khan, became the new khan. Mongol power reached its highest point during his rule. Kublai Khan was interested mainly in China, though, and thought of himself as a Chinese emperor. He even moved his capital to what is now Beijing. He then defeated the Song Dynasty of southern China and established the Yuan, or Mongol, Dynasty over all of China. That dynasty lasted until 1368.

Fall of the Empire

The Mongol Empire began to fall apart in the 1300s. The Ming Dynasty took over China in about 1368. In 1380 a group led by Russians defeated the Golden Horde.

The last important Mongol ruler was Timur, or Tamerlane, who died in 1405. His conquests ranged from India and Russia to the Mediterranean Sea. But soon the empire was reduced to the original Mongol homeland and scattered kingdoms.

The Mongols lost power partly because of the way that they ruled their territories. The Mongols depended on local people to rule the conquered lands from day to day. As a result, power slipped away from the Mongol rulers.

Genghis Khan • Mongolia

Mongolia

Mongolia is a large, mountainous country in central Asia. It was once the center of the powerful Mongol Empire, which stretched across Asia into eastern Europe. Ulaanbaatar is Mongolia's capital and largest city.

Geography

Mongolia sits south of Russia and north of China. Mountains rise in the north and the west. The Altai Mountains have the highest peaks. Between the mountains are many lakes and rivers. There are hilly plains in the south and the east. The far south is part of the Gobi, a desert of rock and gravel.

Mongolia has long, cold winters with fierce blizzards. The summers are short and warm. The country is dry, especially in the southern desert. Northern and western Mongolia often have earthquakes.

Plants and Animals

Grasslands and pasture for livestock cover more than three quarters of Mongolia. Forests of larch, cedar, and other trees grow in the mountains. Few plants grow in the dry Gobi.

The animals found in the mountains include bears, deer, elk, wild boars, snow leopards, and sables (a type of weasel). Horses, sheep, donkeys, and camels live in the plains and some parts of the desert.

People

About 80 percent of the people are Mongols. The largest group of Mongols is the Khalkhas. Khalkha Mongolian is the country's main language. Nearly all Mongols are Buddhists.

The largest group of people who are not Mongols are the Kazakhs of western Mongolia. The Kazakhs speak a Turkic language. Many of them are Muslims.

More than half of the population lives in cities or towns. Some people in the huge rural areas live in yurts, or round tents.

Economy

Raising livestock is an important part of Mongolia's economy. Herders raise millions of sheep, goats, cattle, horses, camels, and pigs. A smaller number of farmers grow wheat, potatoes, and other vegetables.

A woman cares for her goats outside of a yurt in Mongolia.

Mining is Mongolia's most important industry. Mines provide coal, copper, and gold. Other industries process foods and make cloth, clothing, and leather goods. The country is famous for making cashmere, a very soft fiber made from the hair of Kashmir goats.

Ulaangom

A Mongolian girl holds up a lamb. The raising of sheep and other livestock is a major part of Mongolia's economy.

History

For thousands of years the people of Mongolia were nomads, or wanderers. The nomads moved around to find food and water for their livestock. Some nomads began to form tribes about 1,000 years ago.

In 1206 Genghis Khan became the ruler of all the Mongol tribes. Under Genghis Khan the Mongols began conquering peoples in surrounding lands. By the end of the 1200s the Mongol armies had created a huge empire. It stretched across China and Russia into parts of the Middle East and eastern Europe. The Mongols also set up a royal family, known as the Yuan Dynasty, to rule China. The Mongols lost most of their territory in the 1300s. However, they kept their original homeland in central Asia.

In the 1600s a new Chinese dynasty, the Qing Dynasty, conquered Mongolia. The Chinese divided the territory into Inner Mongolia in the south and Outer Mongolia in the north. Inner Mongolia is still a part of China.

In 1911 Outer Mongolia gained independence from China. With the help of the Soviet Union, Communists won power in Mongolia by 1924. The country cut its ties to the Soviet Union in the early 1990s. Mongolia held democratic elections in 1990.

Mongoose

Mongoose are small, quick mammals that are known for killing cobras and other poisonous snakes. A mongoose darts at the snake's skull, trying to crack it with a powerful bite. There are more than 40 different species, or types, of mongoose. They live in Africa, Asia, and southern Europe. The meerkat of southwestern Africa is a member of the mongoose family.

Mongoose are small and have short legs. They are about 7 to 35 inches (18 to 90 centimeters) long. The furry tail adds another 6 to 12 inches (15 to 30 centimeters). Mongoose have pointed noses and small ears. Their fur is gray to brown, sometimes with light flecks or dark spots.

Mongoose may live alone, in pairs, or in groups. Most mongoose live in underground holes called burrows. Mongoose eat small mammals, birds, reptiles, eggs, and fruit. Females usually give birth to two to four young.

Mongoose are bold snake fighters.

In the late 1800s people brought mongooses to the islands of Hawaii and Jamaica to kill rodents and snakes. But the mongooses also killed many rare and useful animals. The United States has strict rules about bringing mongooses into the country.

Monk

A monk is a man who lives apart from society and devotes his life to religion. Monks tend to live a simple life of prayer and work. They usually do not have many belongings.

Types of Monk

There are two main types of monk. The first type is a hermit—a person who lives away from other people. These monks believe that being alone will help them get closer to God.

The second type of monk lives with other monks. The place where they live is called a monastery. Monks in monasteries have set times to pray, work, and study.

Roles

Some monks have helped the sick and the poor. Monks have also spread culture and education. Many years ago, they were often the only members of society who could read and write. They copied the Bible and other texts and set up some of the first libraries. They also did scientific research and taught farming.

Did You Know?

Roman Catholic monks are usually called brothers.

Buddhist monks line up to receive food from a woman in Southeast Asia.

Monks in Different Religions

Monks are found in several religions, including Christianity, Hinduism, Sikhism, Jainism, and Buddhism. Some of these religions allow female monks. They are called nuns. Monks are not officially a part of Islam or Judaism. However, people of those religions have formed religious communities.

Christianity

Saint Pachomius was a Christian who lived in Egypt in the AD 300s. He founded the first community of Christian monks.

During the Middle Ages (AD 500–1500) several orders (groups) of Catholic monks developed. The Benedictine, Dominican, and Franciscan orders of monks still exist today.

Eastern Orthodox monks helped to spread Christianity throughout eastern Europe. They did not form orders like Catholic monks, but they often lived together in communities.

Hinduism

Hindu monks in India appeared much earlier than Christian monks. Hindu monks spend most of their time in deep thought. Many live in monasteries.

Sikhism

Sikhism, centered in India, has some believers who are similar to Hindu monks. Some act as missionaries to spread Sikh beliefs.

Jainism

Jainism, also practiced in India, has two sects (divisions) of monks. Jain monks are vegetarian because they do not wish to harm any living creatures.

Buddhism

There are groups of Buddhist monks in many parts of Asia. Some Buddhist monks live in monasteries, where they study and teach their religion. Other monks wander alone. Buddhist monks do not generally work. They survive by begging for food.

Monkey

Monkeys are clever, social animals. They are known for running and leaping through trees with ease. Like apes and humans, monkeys belong to the group of mammals called primates.

Monkeys look somewhat like apes—for example, chimpanzees and orangutans.

Sakis and tamarins are New World monkeys. Mangabeys, drills, and colobus are Old World monkeys.

But monkeys differ from apes in several ways. For instance, every monkey has a tail, even if it is just a tiny nub. Apes do not have tails. Monkeys also generally have narrower chests than apes do.

There are about 200 species, or types, of monkey. Scientists divide them into two groups, Old World monkeys and New World monkeys. Old World monkeys include baboons, drills, mandrills, macaques, guenons, langurs, and colobus monkeys. Among the New World monkeys are marmosets, tamarins, howler monkeys, spider monkeys, squirrel monkeys, woolly monkeys, and capuchins.

Where Monkeys Live

Old World monkeys are found in Africa and parts of Asia. New World monkeys are found in the tropical regions of Central and South America. Most monkeys live mainly in trees in rain forests. Baboons and some other kinds live mostly on the ground in grasslands or rocky areas.

Physical Features

Monkeys vary greatly in size. The pygmy marmoset is only about 6 inches (14 centimeters) long, not including the tail. The largest baboons may grow to 45 inches (115 centimeters) in length.

An ebony langur climbs using all four of its limbs. An Old World monkey, the ebony langur is an endangered species that lives on Java, an island of Indonesia.

On the whole, Old World monkeys are larger than New World monkeys. Old World monkeys also have narrower noses than New World monkeys do. New World monkeys usually have long tails. Some kinds even use their tails to hold onto branches. By contrast, Old World monkeys cannot hold things with their tails. And some have only short stubs for tails.

Monkeys use all four limbs—two arms and two legs—to walk, run, and jump. Their hands and feet are good for grasping tree branches. Monkeys have a coat of hair on most of the body. Many types have bare areas of skin on the face and buttocks. Male mandrills and some other types have brightly colored skin in these bare areas. Most monkeys have fairly flat faces. However, baboons and

mandrills have doglike faces, with snouts that stick out.

Behavior

Most monkey species are active mostly during the day. But owl monkeys are active at night. They are also called night monkeys. Monkeys leap from tree to tree. They can sit and stand upright. Most species run along branches rather than swinging like apes do.

Monkeys are intelligent animals that are good at solving problems. Almost all types live together in groups. A monkey group commonly includes several related females, their young, and one or more males.

Monkeys use facial expressions, body movements, and various noises to communicate with each other. For example, squirrel monkeys have more than 25 different calls. These calls can sound like barks, purrs, screams, peeps, and squawks. The deep howls of howler monkeys can be heard from 2 to 3 miles (3 to 5 kilometers) away.

A family of anubis baboons in Kenya eats seeds together. An animal called a wildebeest is in the distance.

Most monkeys eat mainly plants. Different types eat fruits, flowers, seeds, shoots, roots, and leaves. Some types of monkey also eat birds' eggs, insects, and other small animals.

Reproduction

The period of pregnancy in monkeys ranges from about five months to more than seven months. In most species the female usually has one baby at a time. The babies are born helpless. Monkeys depend heavily on their parents for care during their early life. In most types the young monkeys become adults at about 3 to 4 years of age.

Under Threat

Many types of monkey are endangered, or at risk of dying out completely. People have cut down the trees in large parts of the rain forests where monkeys live. People also hunt monkeys for their meat and fur. In addition, some monkeys are captured and sold as pets.

Monomotapa

Monomotapa (or Mwene Matapa) was the title of a line of kings in southeastern Africa. The name is also used for the empire that they ruled from the 1300s to the 1600s. The Monomotapa lands lay between the Zambezi and Limpopo rivers in what are now Zimbabwe and Mozambique.

The Monomotapa people were members of the Shona ethnic group. They may have been related to the people of a nearby empire. That empire was centered on a city that is now known as Great Zimbabwe.

The people of the Monomotapa empire were mainly farmers. They also traded gold and ivory along the coast of the Indian Ocean.

According to legend, a ruler named Mbire founded the Monomotapa line of kings in the 1300s. His great-great-grandson Nyatsimba built up the empire in the late 1400s. Nyatsimba was the first king to have the title Monomotapa.

Portuguese explorers arrived in the area in the 1500s. In 1629 they put a king named Mavura on the throne. Mavura became a Christian and welcomed Portuguese traders and missionaries (Christians who worked to spread their

religion). Late in the 1600s the nearby Rozwi kingdom took power away from the Monomotapa.

Mononucleosis

Mononucleosis is a common disease that mostly affects teenagers and young adults. It is also called mono, glandular fever, or the “kissing disease.” Mononucleosis can last several weeks, but it is usually not serious. A virus found in saliva causes the disease.

The first symptoms, or signs, of mononucleosis include headache, fever, muscle aches, and tiredness. People with the disease may sleep 12 to 16 hours a day. A sore throat, joint pain, swollen glands, loss of appetite, a rash, and stomach pain may follow the first symptoms. In rare cases mononucleosis can lead to swelling and rupture of the organ called the spleen. The symptoms usually last for one to two weeks. However, the tiredness may last up to several months.

Scientists think that a kind of germ called the Epstein-Barr virus causes mononucleosis. People infected with the virus can spread it by kissing, coughing, or sharing food and drinks. The virus stays in the body for life. After having mononucleosis, people are immune to the disease. This means that they will not get it again.

There is no cure for mononucleosis. Treatment involves making sick people

more comfortable. They need plenty of rest and lots of fluids. People with mononucleosis should also avoid exercise and hard work until all the symptoms are gone.

Monroe, James

James Monroe was the fifth president of the United States. He is best known for the Monroe Doctrine, a warning to European nations to stay out of the Americas. During Monroe’s two terms the country expanded and enjoyed growing wealth.

Early Life and Career

James Monroe was born in Westmoreland County, Virginia, on April 28, 1758. He was one of the five children of

James Monroe was the fifth president of the United States.

Did You Know?

Many people become infected with the Epstein-Barr virus without getting mononucleosis.

TIMELINE

Monroe is born in Westmoreland County, Virginia.

April 28, 1758

President James Madison makes Monroe secretary of state.

1811

Monroe states the Monroe Doctrine.

1823

Monroe dies in New York City.

July 4, 1831

Monroe becomes governor of Virginia.

1800

Monroe is elected president.

1816

Monroe retires from the presidency.

1825

Spence and Elizabeth Monroe. The American Revolution interrupted James's studies at the College of William and Mary. In 1776 Monroe left school to serve in the Army.

After the war Monroe studied law under Thomas Jefferson. Monroe was elected to the Virginia legislature in 1782. From 1783 to 1786 he served in the Continental Congress. Monroe married Elizabeth Kortright in 1786. They had three children.

Political Career

In 1790 Monroe was elected to the U.S. Senate, where he strongly opposed President George Washington. Monroe became minister to France in 1794, but Washington ordered him home in 1796.

Monroe served as governor of Virginia from 1800 to 1803. When Jefferson became president he sent Monroe to France to help buy the Louisiana Terri-

tory. Next Monroe served as minister to Great Britain.

In 1811 Monroe again became governor of Virginia. Later that year he resigned to become secretary of state under President James Madison. In 1814–15 he also served as secretary of war.

Presidency

Monroe won election as president in 1816. A Democratic-Republican, he easily defeated Rufus King of the Federalist Party. Monroe was reelected in 1820.

Monroe faced the country's first conflict over slavery when Missouri wanted to enter the Union. The North did not want to allow slavery in the new state. Finally, in 1820 Congress decided to admit Maine as a free (without slavery) state to balance the addition of Missouri, a slave state. That agreement was known as the Missouri Compromise.

Monroe gained the territory of Florida from Spain by 1821. In 1823 he announced the famous policy that came to be called the Monroe Doctrine. Monroe stated that Europe should not form any more colonies in the Americas. He also stated that European countries should stay out of the affairs of the Western Hemisphere.

Retirement

In 1825 Monroe retired to Oak Hill, Virginia. He later moved to New York City, where he died on July 4, 1831.

Monrovia

Population
(2008 estimate), urban area, 1,010,970

Monrovia is the capital of Liberia, a country in western Africa. The city lies on the coast of the Atlantic Ocean. It is Liberia's main port and largest city. Monrovia suffered much damage during a civil war in the late 20th and early 21st centuries.

Government buildings stand in Liberia's capital, Monrovia.

Shipping goods through the port is important to Monrovia's economy. Rubber is the main product that Liberia ships out through Monrovia. In addition, many ships around the world have carried the name of Monrovia as their home port. Shipowners pay fees to register their ships there. The city is also Liberia's center of education and business. However, many of its businesses were hurt by the long war.

Liberia was created in the 1800s to be a home for former slaves. Freed U.S. slaves began settling Monrovia in 1822. The town was named after James Monroe, who was president of the United States at the time. In 1847 Monrovia became the new country's capital.

Rebels fought the government of Liberia from 1989 to 2003. Fierce fighting took place in and around Monrovia. After the war the city began to rebuild its damaged buildings and economy.

Montana

The U.S. state of Montana got its name from the Spanish word for “mountain.” The Rocky Mountains cover the western part of this large state. Montana is the nation’s fourth largest state.

Because of the many minerals found in Montana, the state is nicknamed the Treasure State. People flocked to the area in the 1860s looking for gold. The state capital is Helena.

Geography

Montana is located in the northwestern part of the United States. Montana is bordered on the north by three Canadian provinces: Saskatchewan, Alberta, and British Columbia. The U.S. state of Idaho is to the west and southwest. Wyoming is to the south, and North Dakota and South Dakota form the eastern border.

Although Montana’s name suggests a mountainous region, high plains cover more than half of the state. The Rocky Mountain part of the state includes many mountain ranges, including the Bitterroot. Between the ranges are narrow valleys that are good for growing crops.

One of the country’s great rivers, the Missouri, begins in the Rocky Mountain area of Montana. It eventually joins the Mississippi River north of Saint Louis, Missouri.

People

Whites make up about 90 percent of the state’s population. The early white settlers of Montana came from almost every state in the Union. Later others arrived from many European countries and Canada.

Montana was originally home to several Native American tribes, including Crow, Blackfoot, Sioux, Assiniboin, Cheyenne, Shoshone, Arapaho, Flathead, and Kootenai. Today Native Americans make up about 6 percent of Montana’s population. Many of them live on reservations.

Economy

Montana has thousands of farms and ranches, many of them quite large. Sales of livestock, particularly cattle and sheep, account for more than half of the state’s agricultural income. Montana is also a leading producer of barley and wheat.

Montana has large commercial forests. The production of lumber and wood products is the state's leading manufacturing industry. Food processing is another major industry. The largest share of the state's workers, however, work in service industries. Government operations and health care are among the most important of these. The tourist industry is one of Montana's largest sources of income. Coal, petroleum (oil), and natural gas are the most valuable mineral resources.

History

Montana was part of the land the United States bought from France in the Louisiana Purchase of 1803. A few years later members of the Lewis and Clark Expedition explored and reported on the territory.

Gold discoveries in the early 1860s brought miners to the area. Cattle and sheep raising began later in the decade. In 1881 copper was discovered near Butte, giving rise to another major industry.

Montana Territory was created in 1864. It became the nation's 41st state in 1889. Beginning in about 1900 settlers known as homesteaders entered the state to claim land. They introduced large-scale grain farming to the area.

By the 1920s Montana's farm economy was struggling. The situation was made worse by the Great Depression of the 1930s. Eventually scientists made advances in farming that helped the farmers. Forestry and mining began to

Bear Hat Mountain towers above Hidden Lake in Montana's Glacier National Park.

grow as well. These all helped the economy to recover. In the early 21st century Montana worked to develop its tourism industry and to encourage the development of other businesses.

Grave markers at the Little Bighorn Battlefield National Monument in Montana honor people who died there during a famous battle in 1876. A group of Native Americans defeated U.S. troops who were trying to force them to move to a reservation. However, the Indians eventually lost their land.

Montenegro

Montenegro is a small country in south-eastern Europe. It lies on the Balkan Peninsula along the Adriatic Sea. Montenegro has two capitals—Podgorica and Cetinje.

Montenegro borders Croatia, Bosnia and Herzegovina, Serbia, Kosovo, and Albania. Rugged mountains and valleys make up most of Montenegro's land. Forests cover about a third of the country. Wildlife includes foxes, wolves, wildcats, bears, deer, wild pigs, and many kinds of bird.

Most of the country's people are Montenegrin, a Slavic people similar to the Serbs of Serbia. Most Montenegrins are Eastern Orthodox Christians. Some Bosniacs and Albanians also live in Montenegro. They are mainly Muslim.

Manufacturing is a major part of Montenegro's economy. Factories process foods and metals. Farmers grow grains

Sveti Stefan is a vacation center. A road connects it to the mainland of Montenegro.

and raise sheep and goats. Mining, logging, and tourism also are important.

People have lived in what is now Montenegro since ancient times. It became part of the Serbian empire in the 1100s. In 1389 the Ottoman Turks conquered Serbia but not Montenegro. Montenegro was then independent for more than 500 years.

After a period of Turkish rule, Montenegro joined Serbia and neighboring countries to form one larger country in 1918. It was called the Kingdom of Serbs, Croats, and Slovenes. Its name was changed to Yugoslavia in 1929.

In the 1990s parts of Yugoslavia broke away to become independent countries. After a civil war, only Montenegro and Serbia remained part of Yugoslavia. In 2003 they formed a country called Serbia and Montenegro. Montenegro became independent in 2006.

Vermont

Moon

The Moon is a large natural object that orbits, or travels around, Earth. After the sun it is the brightest object in the sky.

The average distance between the Moon and Earth is about 238,900 miles (384,400 kilometers). Compared to the distance between other planets and Earth, this distance is small. In fact, the Moon is close enough to affect the level of seas on Earth. Every day the seas seem to rise and fall. This is because of a force called gravity. The Moon's gravity pulls on Earth. It is too weak to affect the whole planet, but it does make the water move. This creates tides.

The Moon is the most prominent feature in the night sky.

A view of the near side of the Moon shows some of its many craters.

Physical Features

The Moon is slightly more than one quarter the size of Earth. Its diameter, or distance through its center, is about 2,200 miles (3,500 kilometers).

The Moon is made mostly of rock. The surface has thousands of pits called craters. The craters form when chunks of rock and metal called meteorites crash into the Moon. These crashes have covered the Moon's surface with rocks and dust. The Moon also has plains made of lava that erupted from volcanoes billions of years ago.

During the daytime, when the Moon faces the sun, its surface temperature averages about 225° F (107° C). However, at night the temperature drops to about -243° F (-153° C).

Orbit and Spin

Like the planets, the Moon has two types of movement: orbit and spin. The Moon orbits Earth. It takes the Moon

about 27 days to make one trip around Earth. The Moon also spins about its center. It completes one rotation in about 27 days—the same amount of time it takes to complete one orbit. For this reason, the same side of the Moon always faces Earth.

Phases and Eclipses

When viewed from Earth, the Moon looks different at different times. These varying appearances are called phases. Sometimes the Moon looks like a full circle. At other times it appears as only a thin slice or looks completely dark. However, the Moon's shape does not change—it just looks that way from Earth. The Moon reflects light from the sun. As the Moon orbits Earth, the sun shines on different parts of the Moon.

This causes different parts to be visible from Earth.

Sometimes the way the Moon, the sun, and Earth are positioned causes an event called an eclipse. During an eclipse of the sun, the Moon blocks the view of the sun for a short time. During an eclipse of the Moon, Earth prevents the sun from shining on the Moon.

Observation and Exploration

People have observed the Moon since ancient times. In the 1600s the invention of the telescope allowed people to study the Moon more closely.

Even greater advances in knowledge have come from the many spacecraft sent to the Moon since 1959. In 1966

The diagram shows the position of the Moon at each of its phases. The enlarged pictures of each phase are photographs taken from Earth.

Luna 9, a spacecraft from the Soviet Union, became the first unmanned craft to successfully land on the Moon. In 1969 the U.S. Apollo 11 craft carried the first people—Neil Armstrong and Edwin (Buzz) Aldrin, Jr.—to walk on the Moon. Ten other astronauts have walked on the Moon since then.

Moor

In the AD 700s a group of people invaded Spain. These conquerors were Arabs (people from Arabia) and Berbers (a tribe from northern Africa). They practiced the religion of Islam. The Arab-Berber invaders soon began marrying Spanish people. Their descendants came to be known as the Moors.

The arrival of the Arab-Berber invaders began 700 years of Islamic power in Spain. Eventually, however, weak leaders

led to the fall of the Moors. Christian kingdoms that had formed in the northern mountain regions took land from the Moors bit by bit. By 1212 the Moors controlled only the kingdom of Granada in southern Spain.

In 1492 Spanish Christians conquered Granada. The Christians forced Moors who practiced Islam out of Spain. Moors who stayed in Spain became Christians, or they pretended to follow Christianity while secretly practicing Islam.

Descendants of the Moors who stayed in Spain were known as Moriscos. Early in the 1600s the Spanish drove the Moriscos out of Spain because of their political and religious beliefs. Most of them moved to northern Africa. Today descendants of the Moriscos live along the coasts of Morocco and Algeria in northwestern Africa. Sometimes they are still called Moors.

The Alhambra is a palace and fortress overlooking the town of Granada in Spain. It was home to the Moors who ruled parts of Spain from the AD 700s to 1492.

Moose

The moose is the largest animal of the deer family. It is best known for its large head and antlers. The scientific name of the moose is *Alces alces*. Moose are called elk in Europe.

Moose live in Canada, Alaska, and the Rocky Mountain region of the United States. They are also found in the northern forests of Europe and Asia. They like to be near rivers, ponds, and lakes.

An adult male moose stands in water.

Moose are heavy, long-legged animals. A full-grown male may stand more than 7 feet (2.1 meters) tall at the shoulders and weigh more than 1,400 pounds (635 kilograms). Females, or cows, are slightly smaller. A moose's fur is thick and dark brown, though it can look reddish or almost black.

Only a male moose grows antlers. The antlers are flattened with upright points and may spread more than 5 feet (1.5 meters) across. Each year, a male will lose and then regrow its antlers. As the antlers grow, they are covered with a protective skin, called velvet. The velvet eventually rubs off.

Moose are active during the day, especially at dusk and dawn. They have a good sense of hearing and smell, but they do not see very well. Moose rarely run. However, they are good swimmers. They eat water plants such as pondweed and water lilies. They also eat grasses, herbs, twigs, and bark.

Mormon

Members of the Church of Jesus Christ of Latter-day Saints are known as Mormons. The church is based in Salt Lake City, Utah. Its main holy books are the Bible and the *Book of Mormon*.

Beliefs

Joseph Smith, the religion's founder, believed that Christianity had gone astray in its beliefs and practices. In creating Mormonism, he sought to restore the "true" Christian church.

Mormons share the Christian belief that Jesus came to Earth to save humankind. But Mormonism differs from most forms of Christianity in many ways. For example, Mormons believe that the way they live will affect whether they are

Brigham Young was an important president of the Mormon church. In the 1840s he led Mormon settlers to what is now the U.S. state of Utah.

A large Mormon temple stands in Temple Square in Salt Lake City, Utah.

saved. They also believe that faithful members of the church will eventually become gods.

Practices

Faithful Mormons attend worship services regularly. They must not drink alcohol, tea, or coffee or use tobacco. Young people are encouraged to help spread the faith through missionary work for 18–24 months.

Mormons become church members through baptism, a ceremony that involves being blessed with water. Adults also undergo baptism on behalf of their dead ancestors who were not Mormons. They believe that this allows their ancestors to enter God's highest eternal kingdom.

History

Smith said that in 1827 an angel gave him sacred writings. Smith published

these writings as the *Book of Mormon* in 1830 and began to organize a new church.

Smith established religious communities in Ohio and Missouri, but people in Missouri were hostile toward the Mormons. Many Mormons moved to Illinois to found a new city. There, the Mormons' wealth and political power upset their neighbors. In 1844 Smith was arrested and was murdered while in jail.

Brigham Young soon became president of the church. Growing violence against the Mormons led Young to lead them on a long journey to what is now Utah.

But not all Mormons accepted Young as their leader. Some who rejected him remained behind and formed another church. Today, this church is known as the Community of Christ.

In 1849 the Utah Mormons applied for statehood. The U.S. government refused them, mostly because the Mormons engaged in polygamy—a practice in which a man has more than one wife at a time. The Mormon church ended the practice of polygamy in 1890. Utah became a state in 1896.

In the 1900s the church's missionaries won many converts. By 2000 the church had about 11 million members worldwide.

Did You Know?

Mormon temples are different from Mormon churches. Temples are open to Mormons only.

Morocco

The Kingdom of Morocco is the only country in Africa with coastlines on both the Atlantic Ocean and the Mediterranean Sea. Rabat is the capital.

Geography

Morocco sits at the northwestern edge of Africa. It shares borders with Algeria and the territory of Western Sahara.

Morocco has controlled Western Sahara since the 1970s.

The Atlas Mountains divide Morocco into eastern and western halves. The Rif Mountains run along the Mediterranean coast. Mount Toubkal, in the Atlas Mountains, is Morocco's highest peak. It reaches a height of 13,665 feet (4,165 meters). The southern and southeastern edges of Morocco lie within the Sahara, the world's largest desert. Most of the country has mild, wet winters and hot, dry summers.

Plants and Animals

Forests of oak, fir, and cedar trees grow in the mountains. Bushes and grasses cover the lowlands. A forest of cork oak trees grows east of Rabat.

Many large animals in Morocco have disappeared because of hunting. The government protects Morocco's Barbary apes, which live in the Atlas Mountains. Morocco has many birds, including storks, flamingos, pelicans, and cattle egrets.

People

The people of Morocco are mostly Arabs and Berbers (a tribe from northern Africa). More than half of the people live in cities, mainly in the northwest. Arabic is the main language. Some people also speak French or Berber languages. Islam is the national religion.

Economy

Manufacturing and mining are important parts of Morocco's economy. Factories make food and tobacco products, clothing, and chemicals. Morocco's mines provide large amounts of phosphates, which are used to make fertilizers and other products. Tourism is another important industry.

Many Moroccans are farmers or fishers. Major crops include wheat, barley, sugar beets, citrus fruits, vegetables, and olives. The Atlantic Ocean provides a large catch of fish.

History

Morocco's early peoples included Berber tribes. Traders from the Middle East began arriving in North Africa more than 2,000 years ago. The Roman Empire controlled the region in the AD 300s.

Arab armies arrived in 692. Many people converted to Islam. Islamic Berber kingdoms ruled Morocco from the 1000s to the 1200s. They also ruled much of Spain and North Africa. By the end of the 1600s Morocco was a strong and independent Islamic kingdom.

European Control

In 1830 France invaded Morocco's neighbor Algeria. France took control of most of Morocco in 1912. Spain controlled parts of northern and southern Morocco. The Moroccan king stayed on the throne, but the French held the real power.

Colorfully dyed wool is displayed in a market in Marrakech, Morocco.

The Berbers in the Atlas Mountains fought the French until 1934. During World War II (1939–45) Moroccans began to call for independence. Morocco gained independence from both France and Spain in 1956.

Western Sahara

In 1975 Morocco took over the northern part of Western Sahara. The Spanish, who controlled the territory, left in 1976. Morocco took the southern part of Western Sahara from Mauritania in 1979. Meanwhile, a rebel group from Western Sahara was fighting for the territory's independence. To escape the violence many West Saharans went to Algeria. At the start of the 21st century the people of Western Sahara still had not agreed to Moroccan rule.

Moroni

Population
(2003 estimate)
41,600

Moroni is the capital of Comoros, an island country off the east coast of Africa. The city is located on the western edge of Ngazidja (or Grande Comore), the country's largest island. It is the largest city in Comoros.

Moroni has a port on the Indian Ocean. Ships load up there with products such as vanilla, cloves, and ylang-ylang (flowers used in perfume). Tourism also brings money to the city.

Muslim Arabs founded Moroni. The French took over Moroni and the rest of Comoros in the 1800s. Moroni became the capital of the islands in 1958. In

1975 Comoros became an independent country with Moroni as its capital. Afterward the city was the site of many violent protests and takeovers of the country's government.

Morse Code

Morse Code is a system of electronic communication. It uses dots, dashes, and spaces to represent letters, punctuation, and numbers. The symbols are arranged to spell out a message. A machine called a telegraph converts the symbols into electrical signals and sends them across a wire to their destination. The signals are then converted back into the message by the telegraph that receives them.

A U.S. artist and inventor named Samuel F.B. Morse created Morse Code in the 1830s. Before his invention, an important message could take weeks to reach its destination. Morse Code and the telegraph allowed people to receive information sent from far away in just minutes. Wires were strung all across the United States for the use of the code. Newspapers, railroads, and businesses used the code and the telegraph to send news quickly from one city to another.

A second type of Morse Code was created in Europe in 1851. It was called the International Morse Code, or the Continental Morse Code. It was simpler than the original code. It also included extra letters with special marks on them, such

Moscow

Population
(2006 estimate)
10,425,075

Moscow is the capital of Russia, a country that extends from eastern Europe to the Pacific Ocean. It is Russia's major center of industry, science, and culture. The city lies on the Moskva River.

Places of Interest

The collection of buildings called the Kremlin forms the core of the city. It was originally a fortress and has been the center of the country's government for many years. Next to the Kremlin is Red Square, which has been the scene of many protests, parades, and speeches. A famous building on the square is the Cathedral of Saint Basil. Moscow also has more than 30 major theaters and concert halls, including the Bolshoi Theater of Opera and Ballet.

Economy

Moscow is the largest industrial center in Russia. Factories in the city make many products, including machinery, cars, ball bearings, and electrical equipment. Many people in Moscow work in businesses that serve the public, including banks, stores, and restaurants. The city is also a center for education and research.

History

People have lived in the Moscow area since ancient times. In the 1100s a

The colorful domes of the Cathedral of Saint Basil tower over Red Square in Moscow.

prince built a fort to protect the people living there. A settlement close to the fort grew into a town.

By the 1500s Moscow was a major city and was the capital of Russia. However, a new city called Saint Petersburg became Russia's capital in 1712. Most of Moscow's nobles and merchants moved to the new capital. In 1812 there was a great fire in Moscow. These events slowed the city's growth.

Moscow did not recover its role as capital until after the Russian Revolution of 1917. As a result of the revolution, Russia became part of a new country called the Soviet Union. In 1918 Moscow became the capital of the Soviet Union. The city then grew rapidly.

In 1941, during World War II, German troops tried to capture Moscow. However, Soviet troops stopped the invaders a few miles from the city.

The Soviet Union broke apart in 1991. Russia became a separate country again, and Moscow was its capital.

Moses

Moses is a central figure in Judaism. He was the prophet who led the Hebrew slaves out of Egypt. He also helped them form a special relationship with God. Moses is important to Christianity and

An illustration shows the baby Moses being found by the pharaoh's daughter.

Islam too because of his role in communicating God's laws.

Early Life

Moses was probably born in the late 1300s BC in Egypt to Hebrew parents. The Egyptians kept the Hebrews as slaves. The Egyptian ruler, called the pharaoh, had ordered that all newborn male Hebrews be killed. According to tradition, Moses' mother sent him floating down the Nile River in a basket to save him. The pharaoh's daughter found the baby, and he grew up in the royal court.

The Hebrews Leave Egypt

As a young man Moses killed an Egyptian who was beating a Hebrew slave. Then Moses fled to a neighboring land. According to the Bible, he had his first encounter with God there. At the base of Mount Sinai Moses discovered a bush that was burning but was not burned

Did You Know?

Some of the other plagues from God were frogs, locusts, flies, darkness, and hail.

up. From out of the bush he heard the voice of God telling him to ask the pharaoh to free the Hebrews.

The Bible records that Moses pleaded with the pharaoh, but the pharaoh refused to free the Hebrews. God then punished the Egyptians with 10 plagues. The final plague took the life of the pharaoh's son, and the Hebrews left Egypt. But the pharaoh's army pursued them until they were trapped at the Sea of Reeds (once believed to be the Red Sea). What many believe to be a miracle happened there: winds created a dry path through the sea that allowed the Hebrews to cross, and the Egyptian army was drowned as the waters returned.

Ten Commandments

Moses brought the Hebrews to Mount Sinai, where God again revealed himself to Moses. On the mountain God gave Moses the laws known as the Ten Commandments. They told the people to worship God only and forbade such actions as lying, stealing, and killing. God made a covenant, or agreement, with the Hebrews. If they followed His laws, He would be their God forever. Later, these laws and others were recorded in the Torah (part of the Hebrew Bible).

Late Life

Moses spent the rest of his life leading his people through the desert to Canaan (Palestine), a land God had promised to give them. The journey was long and hard. The Hebrews sometimes questioned Moses' leadership and lost faith

in God. When Moses got frustrated with some rebels, God saw it as a lack of faith and denied him entrance to the promised land.

Moses' last official act was to renew the covenant. He then climbed Mount Pisgah, on the eastern edge of the Jordan River. He is believed to have died there—able to see, but not to enter, the promised land. According to the Bible, Moses lived for 120 years.

Mosque

A mosque is a place of prayer for Muslims, or followers of the religion of Islam. The first mosque was the courtyard in the home of Muhammad, Islam's founder.

The inside of a mosque always includes an open space for worship. Rugs or mats

The Blue Mosque in Istanbul, Turkey, is decorated with stained glass and mosaics.

may cover the floor. A nook in one wall, called a *mihrab*, shows the direction of Mecca, Islam's holiest city. To the right of the *mihrab* is a platform or small tower, called a *minbar*. Religious leaders climb steps up to the *minbar*, where they speak to the worshippers. Every mosque must also have a source of running water for washing. Muslims are required to wash before prayer.

Outside most mosques is a tall tower, called a minaret. From the minaret a crier, or *muezzin*, calls Muslims to prayer. Some mosques have up to six minarets.

Mosques are different in some ways from churches and synagogues. They do not have chairs or seats. The worshippers stand together, barefoot, in rows. They bow down and kneel when praying. Men and women worship separately. Mosques never contain statues or pictures, and music and singing are forbidden.

Mosquito

Mosquitoes are insects that are found almost everywhere in the world. Female mosquitoes bite animals and people, leaving itchy bumps. Mosquitoes can spread malaria, yellow fever, and other serious diseases through their bites. Mosquitoes are part of a large group of insects called flies.

When female mosquitoes bite, they inject saliva into the wound. This makes it easier for them to draw blood. The saliva is what causes mosquito bites to itch.

A mosquito has a soft body with a hard covering called an exoskeleton. It has two narrow wings, two antennae, and six long legs. A female mosquito usually has a mouthpart called a proboscis, which looks like a long tube. She uses her proboscis to pierce skin and suck blood from animals. She needs the blood for her eggs to develop. Male mosquitoes do not bite. Their mouthparts are designed for feeding on plant juices.

Female mosquitoes lay their eggs on the surface of standing water. The eggs hatch into long, wriggling larvae. The larvae live at the surface of the water. They molt (shed their outside covering) a few times and then change into a new form, called pupae. Pupae also live in the water. They develop into adults that can fly away and reproduce.

Mosquitoes are considered pests because they carry so many diseases. But getting rid of mosquitoes is difficult. One way is to drain the water out of ditches, swamps, and ponds where they lay their eggs. To destroy full-grown mosquitoes, insecticides are sometimes used. Insecti-

cides are powders or liquids for killing harmful insects. But they can be dangerous for animals and people, too.

Moss

Mosses are small, seedless plants that often grow in moist, shady places. More than 10,000 species, or types, of moss grow throughout the world. They belong to a group of plants called bryophytes. Liverworts and hornworts are other plants in this group.

Mosses range in size from too small to see to more than 40 inches (1 meter) long. They grow closely together in thick mats. Many types of moss form velvety green carpets on forest floors. These green mosses also grow on trees and rocks. Peat, or sphagnum, mosses grow in patches in bogs, in swamps, near ponds, and in other wet places. They may be green, red, orange, or

brown. Granite, or rock, mosses grow on rocks in cold regions. They are reddish brown or black.

Unlike most other plants, mosses reproduce through cells called spores, not seeds. A stalklike structure produces and releases the spores. When a spore lands on a moist surface, it grows into a low, branching structure. This structure spreads across the surface of the soil, wood, or rock. Leafy shoots grow up from this low part of the plant. These shoots produce male and female sex cells. Once two sex cells join together, they grow into a new spore-producing stalk. New moss plants also can grow from pieces of old moss plants.

Some living things called mosses are not really mosses at all. Some, such as Irish moss, are actually algae. Others—including beard moss, Iceland moss, reindeer moss, and oak moss—are lichens. Club mosses and Spanish moss are plants, but they are not related to true mosses.

Mother Goose

Some people think that many children's songs and nursery rhymes were written by someone called Mother Goose. She is often pictured as an elderly woman

Moss covers a forest floor.

"There Was an Old Woman Who Lived in a Shoe" is a popular nursery rhyme from Mother Goose.

riding on the back of a flying goose. But scholars do not know if Mother Goose ever existed.

According to one story Mother Goose was a woman named Elizabeth Goose. She lived in Boston, Massachusetts, in the 1600s. Some people believe that rhymes she made up for her grandchildren survived as the Mother Goose tales familiar today. But no one has found any proof that she wrote the stories.

In France a book of fairy tales published in 1697 was called *Tales of Mother Goose*. In the 1760s John Newbery of England published the first edition of Mother Goose rhymes as they are now known. He probably took the name Mother Goose from the French book. Newbery's book was published in the United States

in about 1785. Generations of American children have learned the rhymes, such as "Humpty Dumpty" and "Little Miss Muffett."

Motion

When we say that something is in motion, we usually mean that it is moving. But motion has a special meaning in science. In science, motion is a change in position compared to a place or an object that is not moving. The place or object that is not moving is called the frame of reference.

Motion is a kind of puzzle because every object in the universe is in motion. This means that no frame of reference is correct in every situation. For example, a car is in motion when the ground is the

A boy on a swing is in motion.

frame of reference. In this situation, we think of the ground as not moving. But the ground, a part of Earth, is in motion when the sun is used as the frame of reference. This is because Earth travels around the sun.

Describing Motion

An object in motion can be described by its speed and its velocity. The speed of a moving object is a measure of how fast it is moving. Speed is equal to the distance the object travels divided by the time it takes to travel that distance. For example, a car that travels 30 miles in one hour has a speed of 30 miles per hour. Velocity describes how fast an object is moving in a certain direction.

Newton's Laws of Motion

In the 1680s the English scientist Isaac Newton came up with three laws that describe motion. In his first law, Newton explained that the motion of an object will not change unless a force pushes or pulls on the object. In his second law, Newton showed that a strong force makes an object move faster than a weak force acting on the same object. In Newton's third law, he said that whenever a force pushes an object, the object pushes back with an equal and opposite force.

Motorcycle

A motorcycle is a two-wheeled vehicle with an engine. Motorcycles are bigger,

heavier, and much faster than bicycles, but they have many similar parts. Like bicycles, motorcycles are often called bikes.

Motorcycles are a common form of transportation throughout the world. People also ride motorcycles in races or just for fun.

Motorcycle Design

Like an automobile, a motorcycle usually has an internal-combustion engine powered by gasoline. The body of the motorcycle, called the frame, is usually made of steel. Handlebars and a cushioned seat sit on top of the frame. The two tires are attached to the front and the back of the frame. They are much like car tires, but smaller.

Brakes, a headlight, a taillight, turn signals, and a horn are important safety features on every motorcycle. Some motorcycles have crash bars, which keep the motorcycle from hitting the ground if it falls over. A motorcycle might also have a windshield for protection.

Many motorcyclists wear protective gear, such as a helmet.

Motorcycles are designed for different purposes. Street bikes, touring bikes, and small mopeds and scooters are built mainly for riding on paved roadways. Touring bikes are specially equipped for long-distance highway travel. Lightweight dirt bikes, racing bikes, trail bikes, and minibikes are meant for off-road biking.

Using a Motorcycle

Motorcycle riders need their hands and their feet to drive their vehicles. The driver turns on the engine using a key. Once the engine is on, the driver uses controls on the handlebars and foot pedals to drive. A twist of a handgrip controls the speed of the vehicle. The handlebars also have a lever to control the front brakes. Pedals control the rear brakes.

Motorcyclists must obey the rules of the road and follow other laws related to motorcycles. Many countries require a special driver's license for operating motorcycles. In some places every motorcyclist must wear a helmet.

History

Many inventors in the 1800s tried to put engines on bicycles. These first motorcycles had steam-powered engines. In 1884 a British inventor put a gasoline engine on a three-wheeled motorcycle. By 1900 many people were building two-wheeled motorcycles with gasoline engines.

Mott, Lucretia

Lucretia Mott

Lucretia Mott helped to begin the movement for women's rights. She was also an early worker against slavery in the United States.

Early Life

Lucretia Coffin was born on January 3, 1793, in Nantucket, Massachusetts. When she was 13 her parents sent her to a Quaker school in Poughkeepsie, New York. She later became a teacher there. As a woman she received only half the pay that male teachers earned. She first became interested in women's rights because of this unequal treatment.

Lucretia married another teacher, James Mott, in 1811. The couple moved to Philadelphia, Pennsylvania, and had six children. Lucretia became a Quaker minister in 1821.

Career

In 1833 Lucretia Mott helped to start the American Anti-Slavery Society. In

Did You Know?

Mott helped to write a declaration of independence for women. It declared that "all men and women are created equal."

1840 the group sent her to a convention, or large meeting, in London, England. However, she was not allowed to take part because she was a woman. Many people were against equal rights for women at that time.

In 1848 Mott and Elizabeth Cady Stanton led the first convention for women's rights. It was held in Seneca Falls, New York. Mott also wrote many articles and gave many speeches in support of women's rights. In 1866 Mott became president of the American Equal Rights Association. This group worked for equal rights, especially voting rights, for all Americans.

Before the American Civil War Mott and her husband used their home as a stop on the Underground Railroad. The Underground Railroad was a system by which people helped runaway slaves escape to the North. After the Civil War Mott worked to get education and jobs for freed slaves. Mott died on November 11, 1880, near Abington, Pennsylvania.

Mound Builder

An amazing assortment of large mounds of earth lies in parts of the eastern United States. Some of the mounds are low, simple cone shapes. Others are tall, wide hills. Still others are shaped like huge animals. These mounds are not natural formations—Native Americans

The effigy mound called Serpent Mound was built by Native American mound builders in what is now the U.S. state of Ohio. The mound is shaped like a snake.

built them. Archaeologists call those people mound builders.

Three important groups of mound builders were the people of the Adena, Hopewell, and Mississippian cultures. They built many different types of mounds. Burial mounds were used as graves. They made these mounds by placing a body on the ground and building a hill of dirt and stones around it. In some burial mounds the bodies of many generations were layered on top of one another. Eventually the mound grew to look like a small hill.

Native Americans also built effigy mounds, which were shaped like such animals as snakes, bears, birds, and lizards. Some effigy mounds served as burial mounds. The purpose of other effigy mounds is unknown.

Other mounds provided platforms for religious temples or leaders' homes. The Cahokia Mounds in southern Illinois are

examples of platform mounds. The people of the Mississippian culture built those mounds, shaped like flat-topped pyramids, between about AD 900 and 1200.

Mountain

A mountain is a landform that rises high above its surroundings. Taller than a hill, it usually has steep slopes and a rounded or sharp peak. Mountains are rarely found alone. Groups of mountains are called ranges. Lines of ranges form mountain belts.

How Mountains Were Formed

Some mountains were formed by the activity of volcanoes. Scientists believe that most volcanic mountains are made up of rock that melted deep within Earth. The rock rose through Earth's surface, or crust. It then flowed onto the

surface in the form of lava. The lava, along with volcanic dust, built up to form mountains. Volcanic mountains are typically steep and cone shaped. Mount Fuji in Japan, Mount Kilimanjaro in Africa, and Mount Rainier in the United States are examples of volcanic mountains.

Other mountains were formed by movements within Earth's crust. The theory called plate tectonics explains this type of mountain building. Earth's crust is divided into huge pieces called plates, which move very slowly. The continents sit on top of the plates and move with them. At times the plates collide, forcing the rock upward. The Himalayas of Asia are an example of this type of mountain chain. They were formed when a plate carrying India collided with the Asian plate.

Living in Mountain Lands

Mountain ranges are natural barriers to travel. Roads are difficult to build across them. Railroads need expensive tunnels to cross even low mountains. Therefore mountain ranges tend to divide the people on either side of them. They often form borders between countries.

Life is hard in mountain lands. The high places of the world are cold and have little soil, making farming difficult. However, many mountain areas are vacation resorts. Skiing and climbing are popular mountain sports.

Did You Know?

Earth's highest mountain is Mount Everest. It is in the Himalayas, on the border between Nepal and China. It is 29,035 feet (8,850 meters) high.

Hiking is a popular mountain sport.

Mount Olympus

► see Olympus, Mount.

Mouse

Mice are small, gnawing mammals that belong to the rodent family. They can be found almost everywhere in the world. In many countries they are the most common animal.

The house mouse is a well-known type of mouse.

There are 38 species, or types, of mouse. The most commonly known is the house mouse. It is most often found in buildings. The house mouse grows to about 8 inches (20 centimeters) long from its nose to the tip of its tail. It has a scaly tail that is about half as long as its body. Its fur is brown or gray.

Mice live mainly on the ground and are active at night. Some types are good climbers while others are strong swimmers. They use their senses of smell and hearing to find their way around. House mice build their nests in hidden spots near food. Mice eat almost anything, including seeds, grains, and insects. Sometimes they eat human foods.

It takes about three weeks for a litter of house mice to be born. Each litter has about 1 to 18 young. A pair of mice can

give birth to 30 or 40 babies a year, even more if food is plentiful.

Mice are often considered pests. They can destroy food supplies and gnaw holes in homes. They also can spread disease. However, some people keep mice as pets.

Mouth

In most animals, food enters the body through the mouth. The mouth is the opening to the digestive system. The digestive system is a group of body parts that breaks down food into fuel for the body.

In humans and many other animals, the mouth is the place where food is chewed and mixed with a clear liquid called saliva. The mouth is a way for air to enter the body, too. Human beings also use their mouths for speaking and for making facial expressions.

The Human Mouth

The human mouth includes several parts. The lips surround the outside edge of the mouth. The cheeks form the sides of the mouth, and the floor forms the bottom. Saliva enters the mouth through small tubes in the floor and the cheeks. The roof is the top of the mouth. It has two parts. The part in front is bone covered by flesh. The part in back is soft flesh. A small piece of flesh called the uvula hangs from the roof of the mouth in back.

Humans take in air and food through the mouth.

Behind the lips, two sets of teeth grow from the top and the bottom of the mouth. A person uses the teeth to chew food before swallowing it. Gums surround the teeth and connect them to the jawbone. The tongue helps to control food while chewing and to make sounds for speech.

Mouths of Other Animals

Animals have many different mouth shapes and structures. These different types of mouths allow each type of animal to eat a certain diet. Anteaters have small, tube-shaped mouths with no teeth. They use their long tongues to lick up insects. A hard beak surrounds the mouth of a bird. Insects have special features called mouthparts near their

mouths. Grasshoppers have jaws for chewing plants as well as mouthparts that hold food in place. Butterflies and moths have tubelike mouthparts to suck food into the mouth.

Digestive System • Teeth • Tongue

Movie

Movies are a form of entertainment that is popular all over the world. Movies are pictures that seem to move when shown on a screen. They are also called motion pictures or films.

Equipment

Making and viewing a movie requires special equipment. Two important pieces of equipment are the movie camera and the movie projector.

A movie camera records photographs, or pictures, on film. A movie camera takes many still pictures very quickly. Most movie cameras take 24 pictures every second. Because they are taken so close

Many people work together to make a movie.

together they catch very small differences in movement.

A movie projector makes the still pictures appear to move. As film runs through it, a projector flashes the pictures one after the other on a screen. The pictures go past the eye so quickly that the brain links them together as a moving scene.

The projector also plays the movie's sound track. The sound track contains all of the sounds of the movie, including talking, music, and sound effects. The sound track is a thin band that runs along the edge of the film, next to the pictures.

Movie theaters receive reels of film. A typical film is five or six reels long. Theaters usually join the reels together to make larger reels. Then one or two projectors play the reels to show the movie on the screen.

People Who Make Movies

Making a movie takes many people. The producer handles the business matters. The producer raises money for making the movie and hires people, including the screenwriter and the director. The screenwriter puts the story together and writes what the actors will say.

The director turns the written story into a movie. The director works with almost everyone involved in making the movie. The director helps the producer choose the actors and actresses who appear in the movie. During filming, the director decides how scenes are filmed and tells

Chinese director Chen Kaige works on editing his movie *Temptress Moon*.

others what to do. The director oversees the people who handle costumes, makeup, lighting, sound, and cameras.

Some members of a film crew create special effects. Special effects are tricks used to film things that would otherwise be too difficult or expensive to film. For example, miniature models of buildings or vehicles can be used to film such events as earthquakes, floods, fires, and explosions.

A model maker creates a make-believe creature for the movie *The Return of the Jedi*. With the help of special effects, the creature will appear to move in the finished film.

Did You Know?

The United States has a rating system that prevents children from seeing certain movies. No child can see a movie rated NC-17.

After the filming is done, editors put the pictures and sound together. Usually the director films a lot of material that will not fit in the final movie. Film editors work with the director to cut scenes and move others around. Sound editors make sure that the sound track fits well with the pictures.

History

People began experimenting with ways of making and viewing moving pictures in the 1800s. By 1890 the U.S. inventor Thomas Edison had developed a movie camera. In France, Louis and Auguste Lumière invented a combined movie camera and projector in 1895. The Lumière brothers opened the world's first movie theater in Paris, France.

In the early 1900s France was the center of the movie industry. But by 1920 most movies were made in the United States. Big movie studios were set up in Hollywood, a part of Los Angeles, California.

A film crew works on a model of a ship used in the movie *Titanic*.

Computers were used to add many special effects to the Spider-Man movies of the early 21st century.

Early movies did not have color or sound. *The Jazz Singer*, released in 1927, was the first popular movie with sound. The first high-quality color movies were made in the 1930s.

Television became popular in the 1950s. As a result, people saw fewer movies. In the 1970s, big movies such as *Star Wars* brought some people back into theaters.

Film technology changed in the late 20th century. New cameras recorded pictures as digital data instead of using film. Digital recording was also used for sound. Computers were used to produce amazing visual effects. Some animated movies, such as *Toy Story* (1995), were made entirely with computers.

Mozambique

The country of Mozambique sits on Africa's southeastern coast. Mozambique's capital is Maputo.

Geography

Mozambique shares borders with Tanzania, Malawi, Zambia, Zimbabwe, South Africa, and Swaziland. The Indian Ocean lies to the east.

The Zambezi River divides Mozambique into northern and southern regions. The south has mostly lowlands and some highlands. The north has high plains and mountains. Mozambique has warm weather all year.

Plants and Animals

Ironwood, palm, and ebony trees grow in the northwest. Grasses and shrubs grow in the drier south. Mozambique's rich wildlife includes zebras, hippopotamuses, lions, elephants, crocodiles, and giraffes.

People

The largest of Mozambique's many ethnic groups include the Makua, the Tsonga, the Sena, and the Lomwe. Portuguese is the national language, but most people speak African languages. About half of the people follow traditional religions. There are also many Christians and Muslims.

Economy

Most of Mozambique's people make their living by farming. Corn and cassava are the main crops. Mozambique also produces shrimp, coconuts, cotton, sugarcane, cashew nuts, and wood. Factories make aluminum, food products, beverages, cloth, and chemicals.

History

Bantu-speaking peoples moved to the region in about the AD 200s. Arabs later set up trading cities along the coast. The Portuguese settled in the region in the 1500s. They sold many Mozambicans as slaves.

In 1964 a rebel group called Frelimo began to fight Portuguese rule. Mozambique won independence in 1975. Frelimo took over the government. Rebels soon began fighting Frelimo's government. That deadly civil war lasted until 1992. Mozambique held democratic elections in 1994.

Mozart, Wolfgang Amadeus

Wolfgang Amadeus Mozart

Mozart was a brilliant composer of classical music. He wrote many different types of music and excelled in every one. During his short life he composed more than 50 symphonies and 15 operas. He also wrote many works for choir, orchestra, and smaller groups of instruments. Although they are more than 200 years old, his compositions are still very popular.

Child Genius

Wolfgang Amadeus Mozart was born on January 27, 1756, in Salzburg (now in Austria). At age 4 he began playing a keyboard instrument called a harpsichord. At age 5 he composed his own pieces. A year later his father began taking him and his sister to perform concerts throughout Europe. Mozart

played the violin, organ, piano, and harpsichord.

Mozart mastered the styles of music that were popular in different cities in Europe. He also published his first musical compositions. His first opera was performed in Salzburg in 1769, when he was just 13.

Mature Career

Mozart worked in Salzburg for a few years. First he was an assistant conductor. Later he was an organist. During this time he produced a number of religious works. He also wrote his first serious opera. It was first performed in 1781, just after Mozart's 25th birthday.

Later that year Mozart moved to Vienna. He was successful there as a pianist and composer. But he spent more money than he earned. He had financial problems for much of his life.

In Vienna Mozart wrote some of his best works for piano and orchestra. During his last years he wrote some of his greatest symphonies and operas. His most popular operas include *Le nozze di Figaro* (The Marriage of Figaro), *Don Giovanni*, and *Die Zauberflöte* (The Magic Flute). In 1791 Mozart began working on a mass for the dead, called a requiem. But he fell ill and died before completing it. Mozart died on December 5, 1791, in Vienna.

Mozart composed a symphony (an orchestra piece that is long and has several parts) at age 8.

Mughal Empire

The Mughal Empire ruled most of northern India from the 1500s to the 1700s. The Mughal rulers practiced the religion of Islam. Most of the people they ruled practiced Hinduism. Even so, the Mughals were able to rule successfully. They worked to bring Muslims and Hindus together into a united India.

The founder of the Mughal Empire was named Babur. He was descended from Genghis Khan, who had founded the Mongol Empire in Mongolia more than 300 years earlier. In 1526 Babur conquered the Indian sultanate, or kingdom, called Delhi. By his death in 1530 he controlled much of northern India.

The next great Mughal ruler was Babur's grandson Akbar. He ruled from 1556 to 1605. Akbar led conquests that greatly expanded the empire. He married a Hindu princess and let non-Muslims practice their beliefs. He also encour-

aged art and learning. Because of his accomplishments, he is also known as Akbar the Great.

Akbar's grandson Shah Jahan was the next notable Mughal ruler. He reigned from 1628 to 1658. He is best known for building the beautiful Taj Mahal in the city of Agra.

Shah Jahan's son Aurangzeb ruled from 1658 to 1707. He expanded the empire to its greatest size. But he mistreated Hindus and other non-Muslims. This cost him the support of the people. Some groups rebelled against him. The empire gradually became weaker.

By the middle of the 1700s the Mughals ruled only a small area around the city of Delhi. The British took over this land in 1803. The last Mughal emperor was Bahadur Shah II. The British allowed him to reign until 1857. Then they forced him to leave India.

Muhammad

The prophet Muhammad was the founder of the religion of Islam. Followers of Islam, called Muslims, believe that Muhammad received messages from Allah (God). These messages were later collected into the Koran, the holy book of Islam.

Early Life

Muhammad was born in the Arabian town of Mecca (now in Saudi Arabia) in

The Islamic statement of faith is written in Arabic letters on a palace wall in Istanbul, Turkey. The statement includes the name of Muhammad.

about 570. Muhammad's father died before Muhammad was born, and Muhammad's mother died when he was 6. He was then raised by his grandfather and later by his uncle.

When Muhammad was about 25 years old, he married a rich, older woman named Khadijah. Their marriage helped Muhammad gain wealth and social standing, and they had six children. Although many men at the time had more than one wife, Khadijah was Muhammad's only wife until after her death.

Beginnings of Islam

According to tradition, in about 610 Muhammad had a vision (thought to be of the angel Gabriel) and heard a voice tell him, "You are the messenger of God." At various times during the rest of his life, Muhammad received verbal messages that he believed came directly from God.

Muhammad began preaching in Mecca in about 613. He told people they should worship only one God, which was different from the Arab practice of worshipping many gods. He also told people to be generous as a way of expressing their appreciation to God. His new religion came to be called Islam, meaning "submission to God."

Leaving Mecca

Many people in Mecca were against the new religion. Those who believed in several gods were afraid that their holy places might be destroyed. Merchants disliked Muhammad because he criticized them for being greedy.

Muhammad worried that his enemies might hurt him and his followers, so he encouraged his followers to move to the nearby city of Medina. Muhammad himself reached Medina on September 24, 622, which is considered the starting date for the history of Islam. Muhammad's trip to Medina is known as the Hegira.

Uniting the Tribes

Most Arabs at the time were part of large groups called tribes. Muhammad was determined to join the many Arab tribes together under Islam. He hoped that by uniting they could use their military strength to spread Islam to other areas.

To achieve his goal, Muhammad had to get the support of Mecca. From 622 on, he and his followers fought several battles with forces from Mecca. By the time Muhammad and his forces entered

Did You Know?

Mumbai

Population
(2001 estimate),
city,
11,914,400;
metropolitan
area,
16,368,100

Mumbai is the largest city in India, a country in southern Asia. The city was once called Bombay. It is one of the most populated cities in the world. Its millions of people are crowded onto an island in the Arabian Sea. Bridges connect the city to the nearby mainland of India. Mumbai Island was once seven separate islands, but engineers made them into one island.

Mumbai is India's center of banking, business, and other services. It is also home to the world's largest motion pic-

ture industry. The film industry is called Bollywood, from the names Bombay and Hollywood. The city is also a major port for shipping India's goods out for sale to other countries. Engineering, publishing, computers, communications, and manufacturing also bring money to Mumbai.

In ancient times the Mumbai area was the site of small fishing villages of the Koli people. Later the area fell under the rule of Hindu and then Muslim powers. In 1534 the Portuguese took over the area. They founded the city as a trading post, which became known as Bombay.

In 1661 the Portuguese gave Bombay to the British. Great Britain eventually ruled all of India as a colony. In the

An arch called Gateway of India is Mumbai's most famous monument.

1800s Bombay grew along with its trade and cloth-making industry. It later became a center for the political movement that worked to free India from British rule. India became an independent country in 1947. In 1995 Bombay was renamed Mumbai, which is its name in the local Marathi language.

Mummy

A dead body that has been preserved with chemicals is called a mummy. The Inca of Peru made mummies. Ancient peoples in Australia and on some Pacific islands did also. However, the ancient Egyptians are the best-known makers of mummies.

The Egyptians made mummies for more than 3,000 years. The methods they used changed over the centuries. During the New Kingdom (1500s–1000s BC), Egyptians mummified dead kings and nobles in a process that took 70 days.

Funeral workers started the process by removing the brain and all the inner organs except for the heart. They packed the organs in jars. Next, they soaked the body in salt or chemicals to remove the fat and the outer part of the skin. After the body dried out, they treated both the inside and the outside with spices and preservatives. Then they wrapped the body in linen bandages. Egyptians often painted the wrappings with religious symbols and a portrait of the dead person's face. Finally, they placed the

Scientists prepare to X-ray a 3,000-year-old Egyptian mummy. Scientists use X-rays to learn more about mummies without taking apart the wrappings.

mummy in a carved and painted wooden coffin.

The Egyptians did not use this process for the bodies of poor people. They merely dried them with salt and wrapped them with coarse cloths. The Egyptians also mummified certain animals, especially cats.

Mummies had a religious purpose. Ancient Egyptians believed that dead people needed their bodies in order to pass successfully into the next world. They thought that as long as the body was preserved, the soul could live.

Mumps

Mumps is a very contagious, or catching, disease that causes swelling in the face. It is caused by a virus. Although mumps can infect adults, it is most com-

Mumps causes the glands near the ears to swell.

mon in children between the ages of 5 and 15.

The mumps virus infects the glands that make saliva. Any contact with the saliva of an infected person can spread the disease. Also, an infected person can spread the virus into the air by coughing or sneezing. Another person who breathes that air can get the disease.

The first symptoms, or signs, of mumps may be a runny nose and a low fever. These symptoms usually do not appear until two to three weeks after the person is infected. Soon the area in front of each ear becomes swollen and puffy. The swelling can spread to the upper neck and jaw. In some cases mumps leads to swelling of the brain.

Mumps needs no special treatment. The symptoms start to go away after four or five days. Because mumps spreads easily, infected people should stay home. They should also get plenty of rest.

A person who has been infected with mumps usually develops immunity to the disease. This means that the person will not get mumps again. Children are often given a shot of a substance called a vaccine to keep them from getting the disease.

Muscat

Population
(2007 estimate), city, 28,987; urban area, 785,515

Muscat is the capital of Oman, a country in the Middle East. The city is partly surrounded by mountains. It has a natural harbor on the Gulf of Oman.

Muscat, the capital city of Oman, is located on the Gulf of Oman.

Oman's largest oil company has its headquarters in Muscat. A stock exchange was opened in the city in 1989. Just outside Muscat are Oman's main centers of trade (Matrah) and business (Ruwi).

In ancient times Muscat was under Persian rule. It became an important trading port. Portugal controlled the city from 1508 to 1650. The Portuguese established a trading post and naval base there. Two Portuguese forts from the 1500s still overlook Muscat. Persians again ruled the city from the mid-1600s to the mid-1700s. The family that rules Oman today then took over the area. The family made Muscat its capital.

Muscle

Muscles make it possible for animals to move. Worms move by tightening and relaxing their muscles in waves. Snails and clams crawl with the help of a big muscle called a foot. Insects move their legs and wings with muscles hidden under their exoskeleton, or hard covering. Fish, reptiles, birds, and mammals move with the help of muscles connected to their skeleton.

Muscle connected to a skeleton is called skeletal muscle. Animals with backbones, including humans, also have two other types of muscle: cardiac muscle and smooth muscle. Cardiac muscle

Muscles help animals move.

makes blood flow. Smooth muscle helps to digest food.

Skeletal Muscle

Skeletal muscle lies under the skin. It is made up of long threads, or fibers. Skeletal muscle controls movement, posture (position of the body), and balance. A person can move skeletal muscle just by thinking about it and then doing it.

Cordlike structures called tendons connect skeletal muscle to the skeleton. As skeletal muscle tightens, or contracts, it

gets shorter. It pulls on the bones attached to it. As the muscle relaxes, it gets longer. It lets the bones fall back into place. In this way skeletal muscle makes the bones move the parts of the body.

To make skeletal muscle move, the brain sends a message along a type of nerve called a motor nerve. Motor nerves end in the fibers of the muscle. There the nerves release chemicals that start a wave of electrical and chemical activity. This activity creates energy that moves the muscle.

Skeletal muscle makes bones move parts of the body.

Some of the energy also goes into the body as heat. This means that muscle movement helps to keep the body at the right temperature.

Cardiac Muscle

Cardiac muscle is located in the heart. The fibers of this muscle form a structure like a net. The fibers form the chambers, or hollow areas, of the heart. As the cardiac muscle contracts and relaxes, blood moves in and out of the chambers.

Cardiac muscle is involuntary muscle, which means that it moves automatically. A person does not have to think about telling the heart to beat. The cardiac muscle does not have nerves to tell it to move, either. A special strip of cardiac muscle releases bursts of electricity that help the heart to beat in a regular rhythm.

Smooth Muscle

Smooth muscle helps to move food through the digestive system. It lines the intestines and the stomach. Smooth muscle also moves the diaphragm, which helps with breathing. Smooth muscle makes blood vessels tighten and relax, too. Like cardiac muscle, smooth muscle is involuntary muscle. The nervous system and body chemicals control the actions of smooth muscle.

Problems with Muscles

Using skeletal muscle too much during work or exercise can cause pain. If a muscle stretches too far, it can tear. This is called a muscle strain, or a pulled

Cardiac muscle is located in the heart (left). Smooth muscle is located in the intestines and the stomach (right).

muscle. Skeletal muscle can also cramp (stay tightly contracted) or twitch (move by itself). Muscular dystrophy is a disease that causes muscles to grow very weak over time.

Muse

In ancient Greek and Roman mythology the Muses were nine sister goddesses. They inspired people in the arts and sciences. Before poets or composers in ancient times began any great work, they asked the Muses for help. The word museum comes from a Greek word meaning “place of the Muses.”

According to legend, the father of the Muses was Zeus, the chief god. Their mother was the goddess of memory, named Mnemosyne. In stories the

In works of art, each Muse was usually shown holding a symbol of her specialty, such as a scroll or a musical instrument.

Muses were often companions of Apollo, the god of music and prophecy (predicting the future).

The nine Muses were said to help people sing, dance, and write poetry. Each one had a specialty. Statues of the Muses were a popular decoration in ancient Greece and Rome. Sculptors often showed each Muse holding a symbol of her specialty.

Museum

A museum is a building that holds a collection of objects that are found in nature or objects that people created. Many museums focus on a single subject—for example, art, science, or history.

How Museums Work

Most museums are open to the public. People visit museums to view the collections. The collections educate people about the natural world or human culture. Museums also may offer guided tours, lectures, and special events. Scientists and other scholars sometimes use museums to do research.

Museums add to their collections by buying objects or receiving donations. Museums display some objects all the time. They also display certain objects for a limited time. These displays may include objects borrowed from other museums or from private collectors. Many museums own objects that are never on display at all. Only researchers may view these objects.

Visitors to art museums can see many different types of art in one place.

Types of Museums

Art museums contain collections of paintings, sculptures, and other important works of art. Some art museums' collections cover many different styles and periods of history. Others specialize in artworks from a particular time period or a single art style, such as modern art.

Science museums use their collections to explain different areas of science and technology. Their collections often include machines and tools from the past and present. They may teach people about space travel, medical advances, electronics, or other scientific subjects.

History museums collect objects, called artifacts, that show what human life was like in the past. Artifacts may include clothing, tools, housewares, vehicles, old photographs, and many other kinds of objects. Natural history museums display samples of plants, animals, rocks, and other natural objects.

Some museums have very specific collections. The National Baseball Hall of Fame and Museum in Cooperstown, New York, is one example. Another example is the Rock and Roll Hall of Fame and Museum in Cleveland, Ohio.

History

Since ancient times people have collected objects. For example, religious groups throughout the world collected religious artwork and artifacts.

In the 200s BC a king founded a museum and library in Alexandria, Egypt. But this place was more like a university than a modern museum.

Many modern museums developed from the collections of wealthy people in Europe. During the Renaissance (1300s–1500s), Europeans built large collections of art and historical objects. By the 1600s the owners of some private collections had sold their objects to cities, universities, or other public places.

Two of the world's most famous museums today began as private collections. The British Museum in London,

An exhibit at a science museum teaches children how clouds form.

The remains of a dinosaur nicknamed Sue are on display at the Field Museum of Natural History in Chicago, Illinois.

England, opened to the public in 1759. It contains many archaeological treasures. The Louvre in Paris, France, opened to the public in 1793. It contains many famous works of art. By the late 1800s many countries around the world had built museums.

In the 1900s several new types of museums appeared. They included collections of buildings that re-created whole towns or neighborhoods. Colonial Williamsburg in Virginia is one example. It shows what life was like in the English colonies long ago. Many cities also opened museums designed especially for children.

Library

Music

Music is a group of sounds that people have arranged in a pleasing or meaningful way. All cultures of the world make

some form of music. Music can be simple—for example, one person tapping out a beat on a log drum or singing a children's song. Music can also be complex—for example, hundreds of instruments playing together for hours.

The Elements of Music

All music includes basic elements, or parts. The main elements of music are rhythm, melody, harmony, and form.

Rhythm describes the length of musical sounds. The most important part of rhythm is the pulse, or beat. When you tap your foot to a song you like, you are tapping out the beat. The speed of the beats is called the tempo. The pattern of the beats is called the meter. Drums help other instruments and voices keep the rhythm in many songs.

Melody is a series of different tones, or sounds, in a piece of music. The tones

Most musicians learn to read music.

are played or sung one after another to make up a song. The tones in a melody may be low or high. The highness or lowness of a tone is called its pitch. Musicians describe different tones with the letters A, B, C, D, E, F, and G.

Harmony takes place when people play or sing more than one tone at the same time. Groups of tones played together are called chords. Harmony also describes the way chords go along with a melody.

Form is the way that people put rhythm, melody, and harmony together. There are many different types of musical forms. Repeating a short melody is one of the simplest forms. For example, in the song “Mary Had a Little Lamb,” each verse repeats the same melody. A symphony is a more complex form. In a symphony, different groups of instruments may play different melodies at the same time or a series of harmonies. The rhythm may also change—for example, the tempo may be fast or slow at different points in the symphony.

Musical Notation

Some musicians make up music as they perform. Others sing songs or play pieces that someone else created. Musicians have developed a system for writing down music so that others can play it again. They use certain symbols, called notes, to indicate the tones to be played or sung. The arrangement of the notes shows the order in which the tones should be played. Other numbers and symbols show how fast to play each

Children learn about music as they play the xylophone.

note. All of these numbers and symbols together are known as musical notation.

Musical Instruments

People use their voice to sing. To make other kinds of music they use many different musical instruments. Most musical instruments fall into one of four groups. Stringed instruments, such as violins and harps, have tight strings that make sounds when people pluck or rub them. Wind instruments, such as trumpets and saxophones, make sounds when people blow into them. Percussion instruments, such as drums and rattles, make sounds when people hit or shake them. Keyboard instruments, such as pianos and accordions, make sounds when people press their keys, buttons, or levers.

Types of Music

Most cultures make different types of music. Some music goes along with religious ceremonies. Other music is a part of everyday life. The traditional music made by everyday people is called folk music.

Classical music is a formal and artistic music that developed in Europe over hundreds of years. Orchestras, choirs, and chamber ensembles (small groups of musicians) often perform classical music. Opera is a type of classical music that features dramatic singing.

When large numbers of people enjoy a type of music, it is called popular music. Popular music is usually shorter and simpler than classical music. People often buy recordings of popular music or listen to it on the radio. Some of the many types of popular music are rock, country, hip-hop and rap, the blues, jazz, and world music.

Musical Instrument

An object that can be used to produce music is called a musical instrument. A musical instrument may be as large and complicated as a pipe organ or as small and simple as a tiny bell or whistle. Musical instruments are found in almost all cultures and periods of history. Scientists have found clay drums and shell trumpets that were used thousands of years ago by some of the earliest humans.

Musical instruments have great power to stir human feelings, and they have been

A girl plays a panpipe called a *rondador* in the South American country of Ecuador. A *rondador* is a wind instrument.

used in a variety of ways. In some places they are thought to have magical powers. Drums have been used to chase away evil spirits in many cultures. Religions around the world use instruments in worship services and to mark special

A man in the African country of The Gambia plays a stringed instrument with a long, thin neck.

Did You Know?

The talking drums of West Africa can be heard over a distance of 20 miles (32 kilometers).

holy times. Musical instruments have been used to announce the arrival of kings as well as to inspire soldiers in battle. Of course, they also are played for pleasure and entertainment.

Instruments can be played individually or in groups. In many types of music, a group of musicians playing together is known as a band. In Western classical music, music produced by a small group of musicians is called chamber music. A larger group is known as an orchestra.

Percussion Instruments

Most percussion instruments are used to establish rhythm. Percussion instruments make a sound when they are struck, shaken, scraped, plucked, or rubbed. They include cymbals, castanets, bells, gongs, rattles, xylophones, and drums. Drums have a stretched skin that vibrates when struck or rubbed. They can be beaten with the hands or with other objects, including sticks.

Stringed Instruments

Stringed instruments make use of a stretched string that vibrates when plucked, struck, or rubbed with a bow. They are divided into categories based on how the strings are attached to the body of the instrument. The main categories are harps, lutes, zithers, and lyres. A harp has many strings, each of which produces a different note. The length of the string determines the sound that the string makes. The shortest strings produce the highest notes.

The basic stringed instruments of the modern symphony orchestra are in the lute family. This means that the strings are stretched over a long neck that extends from the body of the instrument. These instruments include (from smallest to largest) the violin, viola,

Percussion Instruments

Percussion instruments include the xylophone, the timpani, the gong, the snare drum, and the bass drum.

Stringed Instruments

Stringed instruments include the violin, the guitar, the cello, the double bass, and the harp.

cello, and double bass. The strings are plucked with the fingers or rubbed with a bow, which is a curved stick with horsehair stretched between the ends. Unlike a harp, these instruments have only four or five strings each. The sound is changed by using the fingers to press down on the strings at different points of the neck. In effect, this temporarily shortens the part of the string that

makes the sound. The wooden body of the instrument makes the sound louder.

Guitars, banjos, and sitars also belong to the lute family. They are played by plucking the strings with either the fingers or a small piece of plastic or metal called a pick. The electric guitar uses an electronic device called an amplifier to make the sound louder.

Wind Instruments

In wind instruments the sound is created by a stream of air that flows through or around the body of the instrument. In most cases the air comes from the player's mouth. In modern Western orchestras wind instruments are divided into brass instruments (made of brass or other metal) and woodwinds (made of wood or metal). Brass instruments include the trombone, trumpet, horn, and tuba.

Many of the woodwinds produce sound when air causes a thin blade of cane or metal, called a reed, to vibrate. The clarinet and saxophone each have one reed, while the oboe and bassoon use two reeds each. The flute and piccolo are woodwinds that have no reeds. In woodwinds the player can produce different sounds by pressing on keys or finger holes. This changes the way the air vibrates as it flows through the body of the instrument.

People throughout the world play different types of flutes, including the whistle flute, panpipes, and recorder. A bagpipe, another form of wind instrument, has two or more pipes with reeds. Air is

Wind Instruments

Wind instruments include the woodwinds, such as the flute, the clarinet, the oboe, and the bassoon. Wind instruments also include brass instruments, such as the trumpet, the horn, the trombone, and the tuba. The saxophone is considered a woodwind, but it may be made of brass.

Musk-ox

The musk-ox is a large, shaggy mammal of the Arctic. It is not really an ox at all. Rather, it is related to sheep and goats. The scientific name of the musk-ox is *Ovibos moschatus*.

The musk-ox roams the tundra (treeless plains) of Alaska, Canada, and Greenland. It usually travels in herds of 20 to 30 animals. It feeds on grass and other plants.

The musk-ox looks like a small bison. It has a large head, a short neck, and short, stout legs. Males, called bulls, can be 7.5 feet (2.3 meters) long and weigh 900

The musk-ox is not really an ox (a type of cattle). It was named for its smell, called musk.

pounds (410 kilograms). Females, called cows, are smaller.

The fur of the musk-ox is dark brown and very long. It hangs so low that it almost sweeps the ground. Under the outer fur is a thick layer of wool. Eskimos (Inuit) use musk-ox fur to make a fine cloth.

Older musk-ox bulls have horns that can be 2 feet (60 centimeters) long. Cows and young musk-oxen have smaller horns. A musk-ox uses its horns as weapons if it feels threatened.

Bulls give off a strong smell during mating season. The animal was named for this smell, which is called musk.

Muskrat

The muskrat is a rodent that looks like a small beaver. Muskrats build homes near lakes, ponds, rivers, and marshes. The scientific name of the muskrat is *Ondatra zibethicus*.

The muskrat is native to North America. In the early 1900s, however, people brought muskrats to northern Europe and Asia. Muskrats quickly made themselves at home in these regions.

The muskrat has brownish red fur that is thick and warm. Its body is about 13 inches (33 centimeters) long. The backs of its feet are partially webbed. The muskrat uses them like paddles when

Musk rats look like a cross between a rat and a beaver. They live in water, where they build homes of mud and plants that rise above the water's surface.

swimming. The animal got its name because it produces a strong odor that smells like musk.

Musk rats are most active during the evening and nighttime. They usually eat water plants.

Musk rats live in family groups. Their home may be a burrow, or hole, in a riverbank. They also may live in mounds of mud and plants in shallow water. A female muskrat can give birth to several litters during a year. A litter consists of 1 to 11 young. The babies are born blind, but after a month they can care for themselves. A muskrat usually lives for about three years in the wild.

The muskrat is hunted for its fur. In some areas people eat muskrats. The animal can become a pest when it digs into dams and other structures.

Mustard

Mustard is a spice made from the seeds of certain plants. There are two main types of mustard plant. One is called white, or yellow, mustard. The other is called brown, or Indian, mustard.

A mustard plant has a soft green stem and produces bright yellow flowers. The plant reaches its full height of 5 to 6.5 feet (1.5 to 2 meters) as its flowers fade. Green pods then appear on its branches. These pods hold the seeds.

Mustard seeds are tiny and almost round. They can be light or dark yellow. The seeds have no odor when whole. But when they are ground up and mixed with water, a chemical reaction takes place. This produces mustard oil, which has a smell and taste.

Mustard plants produce bright yellow flowers.

Mustard is used to flavor foods such as meat and salad dressings. Most people buy mustard as a paste. The paste includes vinegar and other ingredients along with crushed mustard seeds. In some places people cook and eat the leaves of mustard plants.

Mustard also has been used in medicine. Doctors once used mustard to treat chest colds and other illnesses. They also gave a drink made of mustard seeds and warm water to people who had been poisoned. The drink forced the person to vomit out the poison.

Mutation

A mutation is a mistake or a change in a living thing's DNA. DNA, or deoxyribonucleic acid, is a chain of chemical units found in each cell of a living thing. DNA makes up the parts of a cell called genes. The chemical units of DNA are arranged in a particular sequence, or

order in the genes. This sequence forms a kind of code, called a genetic code, that tells cells what to do. If the chain gets out of order, breaks, or changes in some other way, a mutation has occurred.

Some mutations may happen when the DNA is made. Other mutations are the result of damage to the DNA. This damage can be caused by too much exposure to harmful energy, such as X-rays, or to certain chemicals.

Most mutations are harmless. Often a stronger than normal gene can prevent a mutated gene from causing a problem. However, some mutations are very serious. Some can cause a cell to divide incorrectly. This can lead to a type of disease called cancer. Some mutations can be passed from a parent to its offspring, or young. This may cause the young to be born with a defect or a disease. For example, a particular mutation that comes from both parents causes a blood disease called sickle-cell anemia.

But sometimes a mutation leads to a helpful change. For example, a mutation could cause an animal to have a hair color that blended in with its surroundings. This animal would be more likely to survive, and it would pass the hair color down to its young. Scientists think that such mutations lead to the evolution, or formation, of different living things.

As a result of a mutation, a starfish grew only four legs instead of five.

Myanmar

Myanmar is a country in Southeast Asia. In 1989 the government changed the country's name from Burma to Myanmar. The capital was Yangon until 2005. In that year the government began moving some offices north to a site near the town of Pyinmana.

Geography

Myanmar shares borders with Bangladesh, India, China, Laos, and Thailand. The Indian Ocean lies to the west. The land is mostly mountainous.

Plants and Animals

Evergreen rain forests grow in the wettest regions. Teaks and other trees that lose their leaves grow in areas with less rainfall. Many birds, snakes, and monkeys live in the rain forests. Myanmar's tigers and elephants are endangered.

People

The Burman people make up most of the population. The Shan, Karen, and

Ruins of ancient Buddhist temples stand in Pagan (or Bagan), a city in central Myanmar.

other peoples form smaller groups. Burmese is the main language. Most of the people practice Buddhism. Almost three quarters of the population lives in rural areas.

Economy

Most of Myanmar's workers are farmers. The main crops are rice, sugarcane, beans, peanuts, corn, and cotton. Cattle, pigs, and buffalo are the main livestock. Myanmar has deposits of copper, lead, tin, jade, and gems. It also has reserves of oil and natural gas. Factories make clothing, cement, and fertilizers.

History

From the 800s to the 1200s the Burmans ruled a powerful Buddhist kingdom. In the mid-1700s a Burman king unified Myanmar's peoples. Great Britain took control in 1885. The British called the land Burma. Burma gained independence in 1948.

Mythology

Mythology is the rich collection of traditional tales called myths from cultures all over the world. Many myths date back to ancient times. They are stories about how the world was created and why certain things happen. Today the word myth is often used to describe something that is not true. But a myth is not just a made-up story. Myths tell of gods, heroes, and events that a group believes, or at one time believed, to be real. A culture's myths are often closely tied to its religion.

Background

Thousands of years ago people did not have the sciences to help them understand life. For instance, they did not know why the sun rises each morning or why the seasons change. Ancient people saw sickness, death, and natural disasters, but they did not understand what caused them.

Groups of people developed their own stories and beliefs to explain the world around them. These myths were usually not written down. Instead one generation of people passed them along to the next generation by telling them out loud as stories.

Types of Myths

Each group of people has developed its own explanations about the world. But

Many different cultures have created myths to explain the world around them.

all myths try to answer basic questions such as, How was the world created? How did life on Earth begin? Why is there evil in the world?

Myths explain the origins of Earth in many different ways. Many cultures believe that an all-powerful god created the world. For example, a myth of the Polynesian people tells that the god Io formed the world out of water and darkness. Some Native American myths say that the world came up from underground and developed gradually, like a child being born.

To explain the origin of human beings, an ancient story from India described a being called the Self. When the Self became lonely, it divided into two parts, creating man and woman. Their children became the human race. Many myths from western Africa tell that the first beings were a pair of twins. The Sumerians, an ancient Middle Eastern people, believed that the first people came from clay. According to their myths, the water god told his mother to mold bits of clay into the shapes of people.

Many cultures also have myths explaining why there is evil in the world. For example, an ancient Greek myth tells that Pandora was the first woman on Earth. She opened a jar to see what was inside, and all kinds of miseries flew out. So, through her curiosity, troubles were released into the world. A great variety of other myths explain the origins of animals, plants, and events in nature.

Some Figures of Greek and Roman Mythology		
Greek Name	Roman Name	Description
<i>Main Gods and Goddesses</i>		
Aphrodite	Venus	goddess of love
Apollo	Apollo	god of light and music
Ares	Mars	god of war
Artemis	Diana	goddess of hunting
Athena	Minerva	goddess of wisdom
Hades	Pluto	god of the underworld
Hephaestus	Vulcan	god of fire
Hera	Juno	queen of the gods
Hermes	Mercury	messenger of the gods
Hestia	Vesta	goddess of the home
Poseidon	Neptune	god of the sea
Zeus	Jupiter	king of the gods
<i>Other Figures</i>		
Asclepius	Aesculapius	god of medicine
Demeter	Ceres	goddess of farming
Dionysus	Bacchus	god of wine
Erinyes	Furiae (Furies)	goddesses who punished wrongdoers
Eros	Cupid	god of love
Gorgons		female monsters with snakes for hair; included Medusa
Moirai	Parcae (Fates)	three goddesses who controlled humans' lives
Muses	Muses	goddesses of the arts and sciences
Nymphs		goddesses of nature
Titans		family of giants; included Cronus (god of farming) and Prometheus (god of fire)

Many other myths tell of the gods. Stories discuss their births, special powers,

Some Figures of Norse (Northern European) Mythology	
Name	Description
Balder	god of light and peace
Freyja	goddess of love, fertility, battle, and death
Freyr	god of fertility, rain, and sunshine
Frigg	goddess of marriage; wife of Odin
Hel	goddess of the dead
Loki	god of mischief
Odin	chief god
Thor	god of thunder
Tyr	god of war and justice
Ull	god of hunting
Valkyries	female messengers of Odin who took the souls of heroes to Valhalla (heaven for warriors)

and victories over monsters or enemies. Other myths tell about heroes with amazing strength or cleverness. For

instance, ancient Greek myths tell that the brave warrior Heracles completed 12 nearly impossible tasks. The Chinese hero Da Yu is said to have saved China by draining the land after a huge flood.

Collections of Myths

Some cultures developed collections of myths, especially in ancient times. Their stories describe a group of gods and the world that the gods live in.

The ancient Egyptians had many gods. Some looked like people and some looked like animals. For example, the doglike god Anubis was the god of the dead. For a time a ruler named Amen-hotep made the sun the only god. He called the god Aton, and he changed his own name to Akhenaton. After he died the other gods were worshipped again.

The ancient Greeks worshipped 12 main gods. They believed that their gods lived on Mount Olympus. Zeus was the king of the gods.

The ancient Romans borrowed much of the mythology of the Greeks. They gave many of the Greek gods new names. For example, Zeus became known as Jupiter.

Norse mythology developed long ago in northern Europe. Its main god was Odin. He and the other gods lived in Asgard. A palace called Valhalla was part of Asgard. After dying in battle, human warriors were taken to Valhalla by warrior women called Valkyries.

Nail and Claw

On the human body, a nail is a tough plate that grows at the end of a finger or a toe. Most other primates, such as apes and monkeys, also have fingernails and toenails. Many other animals have similar structures called claws, or talons.

Nails and claws are made of a hard protein called keratin. So are hooves, hair, feathers, and horns.

Nails

The outside part of the nail, called the nail plate, is nearly see-through. The nail plate is made of dead cells. Lying below the nail plate is the nail bed. Blood vessels in the nail bed give it a pink color. The nail bed also contains many nerve endings.

The nail grows from the nail root, which is buried under the skin at the base of the nail. As the nail grows, new cells

exposed

A cat's claw is connected to the toe bone.

push the older cells up toward the end of the finger or toe. The tip of the nail looks white because it is no longer attached to the nail bed.

Nails protect the tips of the fingers and toes. People, apes, and monkeys also use their fingernails to scratch and to handle small objects.

Claws and Talons

Reptiles, many mammals, some amphibians, and birds have claws. Some bird claws are called talons. Claws and talons grow in a curved, downward direction from the ends of an animal's toes.

A claw's shape varies among animals. Eagles have long, sharp talons for grabbing prey. Cats have short claws that they can draw back into their footpads.

Like nails, claws protect the ends of an animal's toes. Animals also use their claws to scratch and to clutch objects. Some animals use their claws to dig, to climb, or to fight other animals.

Nairobi

Population
(2006 estimate)
2,864,700

Nairobi is the capital of the country of Kenya. It is the main city of eastern Africa. It was named after a watering hole that was in the area before the city was built. The Masai people called the watering hole Enkare Nairobi, which means “cold water.”

Many of Kenya's businesses and industries are located in Nairobi. Factories in the city make food products, drinks, cigarettes, furniture, and other goods. Many people in Nairobi work for the railways. Goods are loaded on trains in the city and transported to Mombasa, Kenya's main seaport.

Tourism is also important to the economy of Nairobi. Many tourists visit Nairobi National Park, which lies just outside the city. It is a large and beauti-

Large, modern buildings stand near a park in Nairobi, Kenya.

ful nature park where wild animals are protected. The park is home to lions, giraffes, rhinoceroses, zebras, and many kinds of birds.

Nairobi has many important buildings, including law courts and a cathedral. The University of Nairobi and the National Museum of Kenya are also located in the city. In addition, Nairobi has a national theater.

In the late 1800s Great Britain began taking over much of eastern Africa. Nairobi was founded in the late 1890s. It began as a settlement along a railway built by the British. In 1905 the British made Nairobi their capital in eastern Africa. Nairobi soon grew into a large city. In 1963 Kenya became an independent country with Nairobi as its capital.

Namibia

Namibia sits on the southwestern coast of Africa. The country gained independence from South Africa in 1990. Windhoek is Namibia's capital and largest city.

Geography

Namibia shares borders with Angola, Zambia, Botswana, and South Africa. The Atlantic Ocean lies to the west.

The Namib Desert runs along the Atlantic coast. The Central Plateau covers the center of Namibia. It is a high area with hills and mountains. The Kalahari Desert is in the east.

Namibia's climate is generally dry and hot. Because there is little rain, the country has only a few rivers that flow year-round. Droughts are common.

Plants and Animals

The Namib and the Kalahari deserts have few plants. Shrubs and grasses

Footprints line the top of a sand dune in the Namib Desert, Namibia.

cover the Central Plateau. Trees are more common in the north.

Despite its dry landscape, Namibia is home to lions, giraffes, zebras, antelope, elephants, and rhinoceroses. The country protects many animals in Etosha National Park.

People

The Ovambo people and other African groups make up most of Namibia's population. A smaller group of Namibians have mixed African and European roots. White people form another small group. The whites have mainly Dutch or German roots.

English is the national language, but African languages are more commonly spoken. The majority of the population is Christian.

A woman in Namibia carries her son.

More than half of Namibians live in rural areas. The north is more crowded than the south. Very few people live in the Namib Desert.

Economy

Namibia's economy depends on mining. Namibia has some of the largest mineral deposits in Africa. The country is a leading producer of diamonds and uranium. Its other important minerals include zinc, copper, silver, and gold.

Many Namibians are herders, farmers, or fishers. Cattle and sheep are the main livestock. Herders in the south raise karakul sheep for their curly black coats. Farmers grow grains, fruits, vegetables, and beans. Processed fish and beef are important products.

Tourism is growing in Namibia. Visitors come to see the country's natural beauty and wildlife.

History

The earliest people in what is now Namibia were the San, or Bushmen. They followed a nomadic (wandering) way of life based on hunting and gathering. Over the centuries other African peoples settled in the area.

In the late 1400s Portuguese explorers visited the Namibian coast. The Dutch and the English later explored the area. By the 1880s Germans ruled the area, which they called South West Africa. German settlers took most of the good farmland from the Africans. In the early 1900s the local Herero people began a war against the Germans. The Germans responded by killing many Herero.

By 1915 South Africa had taken over South West Africa. The white leaders of South Africa brought their laws known as apartheid to the territory. These laws kept blacks and whites separate and treated blacks unfairly. In 1966 the countries of the United Nations voted to end South Africa's control of South West Africa. However, South Africa refused to give up its control.

Meanwhile, South West Africa became known as Namibia. A group called the South West Africa People's Organization (SWAPO) fought for Namibia's independence. In 1990 Namibia finally won independence. The leader of SWAPO became the nation's first president.

Napoleon

An artist named Jacques-Louis David painted *Napoleon in His Study* in 1812. The painting is in the National Gallery of Art, in Washington, D.C.

Though short in height, Napoleon cast a long shadow across European history. He was emperor of France from 1804 to 1814. He was also one of the most successful military leaders of all time.

Early Life

Napoleon Bonaparte was born on August 15, 1769, on the island of Corsica in the Mediterranean Sea. France then ruled Corsica. Napoleon went to military schools in France. He became an army officer when he was only 16 years old.

Soldier

Napoleon was in Paris (the capital of France) in 1792, when the French

people overthrew their king. This was part of the French Revolution.

Other European rulers wanted to bring back the king. Napoleon helped to defend France's new government in a series of wars. He became a military hero.

Consul

In 1799 a new government called the Consulate took control of France. Napoleon became the leader, called first consul. He made many changes. Most importantly, he introduced a set of laws called the Napoleonic Code. He also continued to fight other European powers. He built up an empire in a series of wars called the Napoleonic Wars.

Emperor

In 1804 Napoleon made himself emperor of France. Other countries banded together against him. He won many victories, but in 1812 he invaded Russia. This was a disaster for the French army. Hundreds of thousands of soldiers died in the cold Russian winter.

Napoleon's enemies saw their chance. Great Britain, Austria, and Prussia joined Russia in a war that became known as the War of Liberation. They finally forced Napoleon from power in 1814.

Last Years

Napoleon was sent away to Elba, a small island off the coast of Italy. In 1815 he escaped to France. He gathered

supporters and seized power once again. This period was known as the Hundred Days. It lasted until British and Prussian troops defeated Napoleon in the battle of Waterloo, in Belgium, in June 1815.

This time Napoleon was sent away to Saint Helena, an island in the South Atlantic Ocean. The British watched him carefully so he could not escape. Napoleon died on Saint Helena on May 5, 1821.

Narcissus

In ancient Greek mythology Narcissus was a handsome young man. He loved himself more than he did others. This flaw led to his death.

Narcissus' father was the river god Cephissus. His mother was Leiriope, a minor female goddess called a nymph.

According to legend, Narcissus was so handsome that many girls fell in love with him. He refused them all, however. The gods wanted to punish Narcissus for being so selfish. They made him fall in love with his own image. Narcissus saw his reflection in a pool of water when he leaned over to take a drink. He became so enchanted with his image that he could never look away. Eventually he died there. The gods then took pity on Narcissus and changed him into

In Greek mythology Narcissus was a man who fell in love with his own image.

a flower. Today a person who is very selfish is sometimes called a narcissist.

Mythology

Narraganset

A Narraganset man from Rhode Island wears traditional dress.

The Narraganset were a powerful Native American people whose homeland included much of what is now Rhode Island. The tribe was nearly destroyed by warfare with the English.

Narraganset families lived in dome-shaped homes called wigwams. The Narraganset grew corn, beans, squash, and sunflowers. They also fished and hunted deer and moose.

In the early 1600s English settlers began to arrive in Narraganset territory. At first the Narraganset were friendly toward the English. They helped the English fight a war against the Pequot tribe in 1637. In 1675, however, the Narraganset tried to stay out of another dispute called King Philip's War. The Narraganset were drawn into the war after they refused to turn over Wampanoag Indians who had fled into their territory. The English

army attacked and burned a large Narraganset village near what is now Kingston, Rhode Island. In the battle nearly 1,000 Narraganset were killed or captured and enslaved.

Surviving Narraganset fled. Most joined other tribes, such as the Mohican, the Abnaki, and the Niantic. Those who merged with the Niantic kept the name Narraganset. At the end of the 20th century there were more than 2,000 Narraganset living in the United States.

The Country Music Hall of Fame and Museum is one of Nashville's leading attractions.

berland River. It is world famous for its country music. A country music radio show called the Grand Ole Opry has been broadcast from the city for more than 75 years. The Country Music Hall of Fame and Museum is also in Nashville.

The music, entertainment, and tourist industries are important to Nashville's economy. In addition, several large insurance, money management, and health care companies have headquarters in the city. Many people work for colleges and universities in Nashville. The city's leading industries also include car manufacturing and printing and publishing.

Nashville has many interesting buildings. The state Capitol was built in 1855. It is the city's central landmark. A copy of the Parthenon, an ancient temple in Athens, Greece, is also located in Nashville. In fact, the city has a number of buildings that look like those in ancient Greece.

Several Native American tribes once lived in the Nashville area. White settlers founded a fort at the site in 1779. The settlement that grew around the fort was named Nashville in 1784. It became the official state capital in 1843.

In 1862, during the American Civil War, Union troops captured Nashville. The last major battle of the Civil War was fought outside the city in 1864.

Nassau

Population
(2002 estimate)
179,300

Nassau is the capital of The Bahamas, an island country in the Atlantic Ocean. The city lies on the coast of New Providence Island. It is the largest city in The Bahamas. Nassau's warm climate and beautiful beaches have made it one of the world's major vacation spots.

Nassau's economy is based mostly on tourism. The city is also a banking center and port. Citrus fruits, fish, rum, and other goods are shipped out through the port for sale overseas.

Vacationers can enjoy sun, sand, and sailboating at a beach near Nassau, The Bahamas.

The British took over The Bahamas in the 1600s. They founded Nassau in the late 1600s. Nassau was a base for pirates in the 1700s. The pirates attacked European ships in the nearby Caribbean Sea. During World War II (1939–45) the United States set up a military base in Nassau. In 1973 The Bahamas became an independent country with Nassau as its capital.

Bahamas, The

Natchez

The Natchez were a Native American people who lived along the Mississippi River. They built their villages near what is now the city of Natchez, Mississippi. Wars with the French destroyed the Natchez as a separate tribe in the 1700s.

The Natchez grew corn, beans, and squash. They also hunted, fished, and gathered wild plants. They lived in tall houses that they made from mud and straw. They built large temples on top of mounds made of earth.

The houses of the Natchez had thatched (straw) roofs.

French traders and settlers arrived in Natchez territory in the early 1700s. The French and the Natchez soon began fighting. By 1730 the French and their Choctaw allies had driven the Natchez from their villages. About 400 Natchez were captured and sold as slaves. Other Natchez joined nearby tribes, such as the Chickasaw, the Creek, and the Cherokee.

In 1832 the surviving Natchez, along with their new tribes, were forced to move to Indian Territory (now Oklahoma). At the end of the 20th century there were only a few Natchez descendants left. The former Grand Village of the Natchez is now a historic site in Mississippi.

Native Americans

National Anthem

People sing patriotic songs to show love for their country. Many countries choose one patriotic song to be their national song, or anthem, which people play or sing at important events. Some national anthems are religious. Others are about important battles. Some simply express pride in the nation.

United States

The national anthem of the United States is “The Star-Spangled Banner.” Francis Scott Key wrote the words during the War of 1812. Congress chose the song as the national anthem in 1931. People sing it at parades, ceremonies, and even before sports events. Though

there are four verses to the song, most people sing only the first one. While singing, people stand and remove their hats as a sign of respect for the country. Some people place their right hand over their heart.

Other Countries

One of the oldest national anthems is the United Kingdom's "God Save the Queen." (If a man is on the throne, the anthem is called "God Save the King.") In some former British colonies people sing different words to the anthem's tune. For example, in the United States people sing "My Country 'Tis of Thee" to the tune. Australia replaced "God Save the Queen" with its own anthem, "Advance Australia Fair," in 1984.

France's national anthem is "La Marseillaise" (Song of Marseille). Like the U.S. national anthem, it was written during a war—in this case, the French Revolution. Canada's anthem, "O Canada," may be sung in either English or French—the two languages of that country. A famous poet named Rabindranath Tagore wrote India's anthem, "Jana-gana-mana" (Thou Art the Ruler of All Minds).

Changes in politics can cause a national anthem to change. For example, the Nazis of Germany used "Deutschland, Deutschland über Alles" (Germany, Germany Above All) as their anthem. After World War II Germany stopped using the song because of its link to Nazism. However, West Germany later used one verse of the song as its anthem. Today Germany uses the same anthem but

National Association for the Advancement of Colored People (NAACP)

The National Association for the Advancement of Colored People (NAACP) is the oldest civil rights organization in the United States. It was created in 1909 to work for equal rights for African Americans and other minority groups. The NAACP has fought discrimination in schools, the workplace, and public places. Its goal is to end

The NAACP is one of the sponsors of a project that checks elections to make sure that all votes are fairly counted.

racism—the belief that one group of people is better than other groups.

Members of the NAACP try to make sure that everyone is treated equally under the law. They ask the U.S. Congress to pass new laws to guarantee that equal treatment. In this way they act to ensure the civil rights of all citizens. Civil rights are those that are granted by the laws of the country. These include the right to vote and to own property.

The NAACP's most famous success is the U.S. Supreme Court decision in the case of *Brown vs. Board of Education of Topeka*. In 1954 lawyers for the NAACP argued that segregation in public schools should end. The justices of the Court agreed and ruled that segregation was illegal. As a result black children could attend the same schools as white children.

The NAACP played an important role during the civil rights movement of the

1960s. Its members helped to organize the March on Washington, a large demonstration for civil rights, in 1963. The NAACP also asked Congress to pass the Civil Rights Act (1964) and the Voting Rights Act (1965).

National Park

A national park is an area set aside by a country's government. Sometimes the government already owns the land. In other cases the government tries to purchase lands it wishes to make into a park. Many national parks are created to preserve the natural environment. Most of the landscapes, plants, and animals in a national park are kept in their natural state. Some national parks do not allow visitors. In others, visitors must follow rules to keep the plants and animals from being hurt by human activity. Some parks protect areas where important events in history occurred.

Macaque monkeys gather in a national park in Japan.

The United States has many national parks. Most are in the West.

In 1872 the U.S. government set up the world's first national park. It was Yellowstone National Park in the state of Wyoming. Since that time, the United States has created many more national parks. They include Acadia National Park in Maine, Grand Canyon National Park in Arizona, Grand Teton National Park in Wyoming, and Yosemite National Park in California.

The U.S. government created the National Park Service in 1916 to oversee the park areas. The service builds roads and campgrounds.

Canada named its first three national parks—Banff, Glacier, and Yoho—in the 1880s. All are in western Canada.

Most of Europe's national parks date from the 1900s. The United Kingdom named its first national parks in 1951.

Africa's national parks have many animals. Serengeti National Park in Tanzania has antelopes, zebras, and lions. Tsavo National Park in Kenya has elephants and rhinoceroses.

National parks in many places are built around natural wonders. For example, Japan's Fuji-Hakone-Izu includes Mount Fuji, a famous volcano. Venezuela's Canaima National Park includes Angel Falls, the world's highest waterfall.

Native Americans, or American Indians

The first peoples in the Americas lived there for thousands of years before European explorers arrived. Descendants of many of these peoples still live in North and South America today.

Arctic peoples, including the Eskimo (Inuit) and the Aleut, lived in the far northern parts of North America. The Carib, the Aztec, the Maya, the Inca, and other groups lived in the Caribbean, Mesoamerica (Mexico and Central America), and South America.

The National Museum of the American Indian opened in 2004 in the U.S. capital of Washington, D.C. The museum teaches visitors about the culture and history of Native Americans.

Many other peoples lived in what are now Canada and the United States. These peoples are known as Native Americans or American Indians. In Canada they are also known as the First Nations.

Early Peoples of the Americas

The first peoples in the Americas probably traveled from Asia to what is now Alaska. Scientists believe that this happened about 60,000 to 20,000 years ago. During this period there may have been solid land where the Bering Strait now divides Asia and North America. By about 10,000 BC these peoples had spread throughout North, Central, and South America.

North American Peoples

The peoples of North America spread out into as many as 240 groups. These groups are sometimes called tribes or nations. The groups spoke different languages, but neighboring groups often had similar ways of life.

Native Americans in eastern North America included the Iroquois in the northeast and the Creek in the southeast. People in these regions used tree bark and branches to make houses, weapons, tools, and canoes. They made clothing from the skins of deer and other animals. They hunted, fished, and gathered wild plants. They also planted corn, squash, beans, and tobacco.

Peoples on the Great Plains of central North America included the Cheyenne and the Sioux. The grasses of the plains fed huge herds of grazing animals,

Before Europeans arrived, different Native American groups lived in many regions of North America.

including elk, deer, antelope, and bison (buffalo). Plains Indians got almost everything they needed from the bison. They ate the meat, made tepees and clothing from the skins, and made tools from the bones.

The Pueblo Indians, the Navajo, and other groups lived in the dry Southwest. Peoples there learned to farm using very little water. Some built homes from stone and adobe (sun-baked clay). Others lived in simpler shelters.

Native Americans of each area are often known for particular types of crafts. The Iroquois wove baskets out of grass (top left). Pueblo Indians made pottery with attractive designs (top right). The Cheyenne made beaded, animal-shaped figures (bottom left) for their children. The Tlingit carved totem poles (bottom right) that showed figures from their myths and legends.

Many groups of Californian Indians lived along the West Coast. They fished and hunted, and some groups made

flour from acorns. The Chumash built dome-shaped houses. The Miwok built houses that were partly underground.

The Great Basin was home to the Shoshone and other peoples. This dry area included what are now Nevada and Utah. These peoples moved around in search of food. They hunted small animals, fished, and gathered berries, nuts, seeds, and roots.

North of this region lived the Nez Percé, the Flathead, and other groups of Plateau Indians. These peoples fished and hunted. They often lived in villages during winter. During summer they camped in tents or tepees.

Many peoples lived on the Northwest Coast, an area that stretched between modern California and Alaska. They included the Tlingit and the Kwakiutl. The peoples of this region fished in the ocean and rivers. Some groups hunted whales. They made large houses and sturdy canoes out of wood.

The Chipewyan, the Cree, and other peoples lived in the subarctic. This area lies south of the Arctic, in what are now

Two dolls (left) show the style of clothes once worn by the Apache. A Cherokee boy (center) performs a dance in festive clothing. Nez Percé (right) display blankets with traditional designs.

Canada and Alaska. Subarctic peoples depended on caribou, moose, and beavers for food. They also made tents and clothing from animal hides.

Native Americans and Europeans

Europeans began to arrive in the Americas in the late 1400s. They called the people they met there Indians because they thought they had arrived in the East Indies, in Asia.

The Europeans brought new plants and animals. The horse brought great change to Native American life. Groups on horseback could travel long distances and hunt bison much more easily than before. Native Americans also welcomed such European goods as cloth fabrics, metal tools, and guns.

But the Europeans also brought diseases, including measles and smallpox. Most Native Americans could not fight these diseases because their ancestors had not been exposed to them. Smallpox soon wiped out many groups.

In the 1600s many people from England settled permanently in eastern North America. Some Native Americans helped the English at first. But as more English colonists arrived, they took over more of the Native Americans' land. Unlike the Native Americans, the colonists thought that individual people could own land.

Several wars broke out between colonists and Native Americans. In King Philip's War (1675–76) the English defeated a group of several tribes. This victory

allowed colonists to settle more land in New England.

Native Americans and the United States

Colonists had taken over much of the land in the Northeast by the end of the American Revolution in 1783. In the 1830s the U.S. government forced the Cherokee and other tribes in the Southeast to move west. Their difficult journey is now known as the Trail of Tears. The government set aside land called Indian Territory (now Oklahoma) for the tribes to live on. However, white settlers soon settled there, too.

In the mid-1800s the U.S. army fought many battles against the peoples of the Great Plains and the Southwest. One of the last conflicts took place in 1890 at Wounded Knee in South Dakota.

Eventually, most of the Native Americans of the West came to live on reservations. These were areas of land that the U.S. government set aside for certain Native American groups. However, a group's reservation often was smaller or in a different place than that group's homeland. Conditions on the reservations were poor. Many Native Americans had to give up their traditional ways of life.

In 1934 the U.S. government began to change the way it treated Native Americans. It passed a law that gave Native American governments more power over their own land and people.

Did You Know?

All Native Americans in the United States did not become citizens until 1924. Many did not get the right to vote until 1948.

In 1964 a group of Native Americans claimed that Alcatraz Island, part of the U.S. state of California, was rightfully theirs. Native Americans took over the island again during 1969–71.

However, many Native Americans were still angry at the U.S. government's treatment of them. A protest group called the American Indian Movement (AIM) formed in the late 1960s. AIM took over Alcatraz Island in San Francisco Bay during 1969–71. In 1973 AIM took over the town of Wounded Knee in South Dakota for more than two months.

Native Americans Today

By 2000 there were nearly 2.5 million Native Americans in the United States. (This number includes the Eskimo and other Arctic peoples.) They made up about 1 percent of the U.S. population. Less than half of them lived on or near reservations. Another 1.7 million people in the United States had some Native American ancestors.

Reservations are outside the reach of many state laws. This has allowed Native American groups to open gambling casinos on their land. These businesses raise money for the groups and provide jobs. Even so, Native Americans who live on reservations generally are poorer than most other Americans.

Native Americans continue to fight for the respect of their history and culture. Some have protested the use of Native American names or mascots by sports teams. Many have demanded that the U.S. government return or pay for the lands where their ancestors lived.

Natural Gas

► see Gas, Natural.

Natural Resource

A natural resource is something that is found in nature and can be used by people. Earth's natural resources include light, air, water, plants, animals, soil, stone, minerals, and fossil fuels. People need some natural resources to stay alive. They use others to make their lives better.

Every place on Earth has its own unique group of natural resources. Some countries have lots of oil or coal. Others have rich soil and thick forests but few miner-

als. The wealthiest countries are usually the ones with the greatest amount or variety of natural resources. They are wealthy because they can sell their resources to other countries that need them.

Renewable Resources

Many of the natural resources people need to survive are renewable. Renewable resources—such as sunlight, water, and air—cannot be used up. However, pollution can make them harder to use.

Plants and animals are also renewable resources. Normally living things replace themselves through reproduction. But some human activities can cause whole groups of living things to disappear forever. Examples of such activities include hunting, logging, building, and polluting.

Freshwater is a renewable resource that is much in demand.

People dig mines to get valuable mineral resources that are found underground. But mines can leave scars on Earth's surface.

Nonrenewable Resources

Nonliving things make up another kind of natural resource. These resources, such as soil, stone, oil, and gases, can take thousands or millions of years to form. They are considered nonrenewable because people use them faster than they can form.

Disappearing Resources

Many people fear that humans are destroying the world's natural resources. Clearing land for farming and building wipes out forests and the animals that live there. Cars and factories use huge amounts of oil every day. They also release poisonous chemicals that pollute the air, water, and soil. Many people are working to conserve, or protect, natural resources. In addition, scientists are working on ways to produce energy and goods without causing pollution or using up valuable natural resources.

Nauru

The country of Nauru occupies a small island in the Pacific Ocean. The capital is an area called Yaren district.

Geography

Nauru is located just south of the equator in the region called Oceania. The climate is hot and humid.

In the center of the island cliffs surround a plateau, or area of high land. The plateau once contained much phosphate, a mineral that is used to make fertilizers. The mining of phosphate has left the plateau bare.

Plants and Animals

Coconut palms and other tropical trees grow near Nauru's coast. Many birds visit the island. There were no mammals in the country until ships brought rats, mice, cats, dogs, and pigs.

People

Most of the people are native Nauruans. About one quarter of the people are

The island of Nauru is the world's smallest republic.

from other Pacific islands. Most Nauruans are Christians. Nauruan is the national language. Many people speak English as well.

Economy

The mining of phosphate made Nauru rich. However, the deposits ran out in the early 21st century. The government worked to develop banking, fishing, and other industries to replace mining. Nauru must buy most of its food and other supplies from other countries.

History

It is not known when the first people came to Nauru. In 1798 a British navigator arrived. He named the island Pleasant. In 1888 Germany took control. A British company began mining Nauru's phosphate deposits in 1907. In 1914 Australia took over the island. In 1942, during World War II, Japanese forces invaded Nauru. Australian troops took back Nauru in 1945. Nauru gained independence in 1967.

Navajo

The Navajo are a Native American people of the southwestern United States. After the Cherokee, they are the country's second largest Native American tribe. The Navajo are also known as the Diné.

The Navajo originally lived in what is now western and central Canada. There they hunted animals and gathered plants to eat. Between AD 900 and 1200 the Navajo migrated southward. Then they began to farm. They lived in houses called hogans. Hogans were six- or eight-sided homes made from wood covered with earth.

The Navajo learned many skills from their neighbors. They probably learned farming from the Pueblo Indians. The Navajo also learned weaving from the Pueblo. Navajo rugs and blankets are well known. The Navajo learned to work with silver from their Mexican neighbors.

Spanish explorers arrived in Navajo lands in the late 1500s. They brought horses, sheep, and cattle. Many Navajo then became animal herders. For many years the Navajo raided Spanish and, later, American settlements. To end the raids the U.S. government went to war against the Navajo in 1863. U.S. troops destroyed Navajo herds and fields. In 1864 the government captured and held about 8,000 Navajo in eastern New Mexico.

A Navajo man creates a sand painting. The Navajo often produce such paintings during healing ceremonies.

In 1868 the Navajo were allowed to return to their homeland. They settled on a reservation along the border of Arizona and New Mexico. Today the Navajo have the largest reservation in the United States. It covers parts of Arizona, New Mexico, and Utah. In 2000 there were almost 270,000 Navajo.

Navigation

Finding the way from place to place is called navigation. Navigators are people who do the work of finding the way. They need to know where they are. They also need to know which way to go.

Ship Navigation

For hundreds of years, navigators of ships have used several methods. One simple method is called piloting. Navigators who use this method look at objects on shore to find their way. Special markers help navigators steer clear of

Officers on a passenger ship use charts for navigation.

dangerous rocks and toward safe passages. These markers include lighthouses and buoys.

When traveling far from land, ship navigators may use the dead reckoning method. Navigators who use this method record how far the ship has traveled in each direction. To do this, they must keep track of the speed of the ship and how long the trip has taken. Compasses and charts help navigators with dead reckoning and piloting. Compasses are devices that help show the navigator

A magnetic compass has a needle that points north. It can be used for land, sea, or air navigation.

which direction the ship is traveling in. Charts are special maps with information that is helpful to navigators. This can include how deep the water is and where there might be rocks or other dangers under the water.

Ship navigators also may use the positions of the sun, Moon, planets, and stars to find their way. This is called celestial navigation. Navigators use special instruments to get exact measurements of the sky. They also use charts of the night sky.

In the 1900s ship navigators began to use radar, radio, and electronic devices to find their way. Radar systems measure distances by bouncing energy off nearby objects. Instruments on ships measure distances using radio signals from shore.

Today many ship navigators use a global positioning system (GPS). These systems use artificial satellites that orbit, or travel around, Earth. Navigators have special devices that send and receive radio signals from the satellites. The signals can tell navigators exactly where on Earth they are located.

Underwater Navigation

Submarine navigators cannot see stars or objects on shore when they are below the surface. They cannot use ordinary radio waves, either. Instead, submarine navigators find their way using energy waves called very-low-frequency radiation. Submarine navigators also have instruments that tell them how far below the surface they are. They use charts of the ocean floor as well.

A sextant is an instrument that is used in celestial navigation. A navigator uses it to find out how high in the sky the sun is. At night it can measure the height of the Moon or a star.

Air Navigation

Airplane navigators can use many of the same methods as ship navigators: piloting, dead reckoning, celestial navigation, radio, radar, and global positioning. The airplane navigator also must keep track of altitude, or how high the airplane is flying. Special instruments and computers on board help navigators do their job. Outside of the aircraft people called air traffic controllers use radio and radar to direct airplanes in and out of busy airports.

Space Navigation

Like ship and airplane navigators, navigators of spaceships use celestial navigation. Because they can see Earth, they can use it as well as the other planets and stars. Computers and radios on the spacecraft and on Earth also help space travelers to navigate.

Navy

A navy is the branch of a country's armed forces that fights on, under, or over the sea. A navy has several main jobs. It protects its country and its allies, or friends, as they carry on ocean trade. It also carries out attacks and other missions at sea during war.

Navies Today

Most navies keep a fleet, or group, of ships that are specially built for certain types of work. Aircraft carriers are ships that carry aircraft. Aircraft can land and take off from their decks. Cruisers and destroyers are ships that fight with guns or rocket-propelled missiles. Submarines and destroyers fight with underwater weapons, such as mines and torpedoes.

More than 100 countries have a navy. The United States has the world's largest and most powerful navy. During war-time, the U.S. Navy also includes the U.S. Coast Guard.

Airplanes are parked between missions on the flight deck of a nuclear-powered aircraft carrier.

Did You Know?

Some countries with no seacoast still have a navy. Examples include Bolivia and Paraguay.

History

A number of ancient civilizations, including ancient Greece and Rome, had navies. Most ancient warships were large wooden vessels powered by oars. During naval warfare, troops tried to sink an enemy's ship by ramming it, setting it on fire, or sending armed forces aboard.

During the 1500s and 1600s warships changed greatly. Sails became the main source of power. They allowed ships to travel farther and faster. Cannons also were mounted on board.

The next important development in warships came in the middle of the 1800s. Countries began to build warships from iron and steel instead of wood. Steam engines replaced sails. In the late 1800s countries built armored, fast-moving battleships with huge, powerful guns.

The battleship was the mightiest naval ship until World War II (1939–45). During this war the Japanese successfully used aircraft carriers. Bomber planes launched from aircraft carriers sank ships, including battleships, far out at sea. Since then air power, including airplanes and missiles, has been the main weapon of the world's navies.

Nazi Party

The Nazi Party was a political group that ruled Germany between 1933 and

1945. "Nazi" is a short form of the official name. In English the official name is the National Socialist German Workers' Party. Under Adolf Hitler's leadership, the Nazis started World War II. They also carried out the Holocaust—the murder of about 6 million Jewish people.

Teachings

The Nazis believed that the people should obey a strong leader. They had no use for democracy, rule of law, human rights, or peace. The Nazis also taught that Germans were born to rule over what they called "inferior races" (lesser peoples). Hitler preached a special hatred against Jews.

Rise of Nazism

Nazism developed after World War I (1914–18). Germany lost that war. This led to hard times for the country. Many Germans blamed the government for their problems. Germans began looking for a change.

Members of Adolf Hitler's private army, the Storm Troopers, march through the streets of Nuremberg, Germany, after a Nazi Party rally.

The group that became the Nazi Party formed in 1919. Hitler soon took control. He attracted many new members with his angry speeches. In 1923 Hitler tried to take over the government but failed.

Nevertheless, the Nazi Party continued to grow. Many people joined the Nazis during the Great Depression—a time of poverty that began in 1929. Germans began to vote for Nazi candidates in elections. In 1933 the president of Germany named Hitler chancellor (prime minister).

Hitler made himself a dictator, or leader with unlimited power. His secret police rounded up his enemies and put them in concentration camps (prison centers).

World War II

Hitler also built up Germany's armed forces. They took over Austria and part of Czechoslovakia. In 1939 Germany invaded Poland. This act set off World War II.

During the war the Nazis carried out the Holocaust. They used poison gas to kill millions of Jews and others.

Hitler's hopes for the Nazi Party ended with Germany's defeat in the war. Hitler killed himself on April 30, 1945. A few days later Germany surrendered.

After World War II

Nazism survived as a small movement in Germany and some other countries. In the 1990s some German youths formed gangs that believed in Nazi ideas. They

were called neo-Nazis (new Nazis). However, the number of neo-Nazis remained small.

N'Djamena

Population
(2005
estimate), urban
area, 888,000

N'Djamena is the capital of Chad, a country in central Africa. The city lies on the Chari River. It is the largest city in Chad.

Many people in N'Djamena work in trade. Farmers from the surrounding area sell their cotton and cattle in the city.

N'Djamena began as a French military post named Fort-Lamy. The French set up Fort-Lamy in 1900 at the site of a small fishing village. They made Fort-Lamy part of a French colony in 1910. Chad became an independent country in 1960. Then the city grew as the country's capital. In 1973 the city was renamed N'Djamena.

Chad

Nebraska

The U.S. state of Nebraska probably got its name from a Native American word meaning “flat water.” This refers to the Platte River, which runs across the middle of the state. Corn is the state’s main crop. Indeed Nebraska’s nickname is the Cornhusker State. The capital of Nebraska is Lincoln.

Geography

Nebraska is located in the central United States in an area known as the Great Plains. The state is bordered on the north by South Dakota, on the west by Colorado and Wyoming, and on the south by Kansas. On the east the Missouri River separates Nebraska from Iowa and Missouri.

The land consists mainly of a rolling plain that rises gradually from east to west. The hills and plains of eastern and southern Nebraska are land that is good for growing crops. The vast Sand Hills country of the north-central and northwestern parts of the state is a treeless, grass-covered region suitable for

grazing cattle and sheep. The climate is dry, with cold winters and hot summers.

People

About 90 percent of Nebraska’s current population is white. The first large groups of Europeans to settle in the region were Germans. Later came Czechs, Swedes, Danes, and Russians.

Nebraska’s largest minority groups are African Americans and Hispanics. Each group makes up about 4 percent of the population.

Economy

Nebraska ranks among the top states in agricultural production. Corn is the most valuable crop. It is raised in the central and southern counties. Soybeans are another important crop. The state is a national leader in the sale of cattle and calves. Hogs are also valuable.

Nebraska’s economy also depends on services provided by various businesses. Business services such as telemarketing grew quickly in the state during the 1990s. Nebraska is also a major center of the U.S. insurance industry.

History

Several Native American tribes were living in the area when Spanish and French explorers visited between the 1500s and 1800s. These tribes included

Cranes gather on the Platte River in Nebraska during their migration north each spring.

the Pawnee, Oto, Missouri, Omaha, and several others.

Nebraska was acquired by the United States as part of an 1803 land deal with France known as the Louisiana Purchase. The first organized exploration of the Nebraska area was by the Lewis and Clark Expedition in 1804. Fur traders began creating trading posts in the area in about 1810.

In the early 1800s Nebraska was part of a large area reserved for Native Americans between the Missouri River and the Rocky Mountains. In 1854 the Kansas-Nebraska Act created territories for both Nebraska and Kansas. The Nebraska Territory was much larger than the present-day state. Between 1861 and 1863 it was reduced to about its present size. In 1867 Nebraska entered the

Union as the 37th state. The completion of the Union Pacific Railroad in 1869 increased settlement in the new state.

A terrible drought during much of the 1930s caused many farmers in Nebraska to give up their land. It also led to an increase in irrigation (watering) projects and improved farming practices. World War II turned the economy around in the early 1940s. Nebraska enjoyed economic growth for several decades.

In the mid-1980s the state was hit hard by a decline in the value of farmland. Many farmers were forced to sell their farms to pay off their bills. In the early 21st century Nebraska was seeking to attract new industries to the state.

Nebula

The Lagoon Nebula can be seen in the constellation Sagittarius.

A nebula is a cloud of gas and dust in space. Nebulas appear in many shapes and colors. Sometimes a nebula blocks out the light of stars beyond it. When this happens, the nebula may look like a dark cloud. Other times a nebula glows a bright color, such as blue or red. This happens when the nebula reflects light from nearby stars or when nearby stars heat the nebula so that it glows.

Nehru, Jawaharlal

In 1947 Jawaharlal Nehru became the first prime minister, or leader, of India. For more than 20 years he had worked with Mahatma Gandhi to free India from British rule.

Nehru was born on November 14, 1889, in Allahabad, India. He studied in Great Britain and became a lawyer.

Nehru met Gandhi in 1916. At that time Great Britain ruled India as a colony. Nehru soon became involved in Gandhi's fight to win India's independence from Britain. Nehru joined the Congress Party, the political group that Gandhi led. In 1929 Gandhi picked Nehru to lead the Congress Party. Nehru angered the British with his work for independence. Between 1921 and 1945 he was jailed nine times.

In 1947 the British finally left India. Nehru then became prime minister of India. He worked to make the country more modern. For example, he encouraged research in science and technology. He also changed ancient laws to give Indian women more rights.

Nehru remained prime minister until his death. He died in New Delhi, India, on May 27, 1964. His daughter, Indira Gandhi, became prime minister two years later.

Nepal

A light dusting of snow covers a village in the mountains of Nepal. Most of the country is mountainous.

Nepal is a small, mountainous country in Asia. Mount Everest, the highest mountain in the world, is on Nepal's northern border. For a long time the mountains kept Nepal closed to the outside world. Nepal's capital is Kathmandu.

Geography

Nepal sits south of China and north of India. The part of China that borders Nepal is called Tibet.

Along its southern border Nepal has low, flat plains. From there the land slopes up to a region of hills and then mountains. In the north are the towering mountains of the Himalayas. The major rivers of Nepal are the Kosi, the Narayani (or Gandak), and the Karnali.

Most of Nepal has a mild climate. The weather is colder and snowier in the higher areas.

Plants and Animals

Native trees such as sissoo and sal grow in the plains and the hills. Pine, oak, poplar, and walnut trees grow in the lower mountains. The forests of the Himalayas contain spruce, fir, cypress, juniper, and birch trees.

Nepal's wildlife includes tigers, leopards, deer, and rhinoceroses. Some people believe that a monster called the Yeti, or Abominable Snowman, lives in Nepal's high, snow-covered mountains. Most people do not believe that the Yeti exists.

People

The population of Nepal includes several ethnic groups. The Tharu, the Newar, and other groups have Indian ancestors. Other peoples, such as the Tamang and the Sherpa, have Tibetan roots. Nepali is the country's main language. Most people live in rural areas in the hilly center of the country.

A man stands next to a selection of brightly colored powders in Kathmandu, Nepal. People use the powders during Hindu festivals.

Facts About NEPAL

Population
(2008 estimate)

Area
56,827 sq mi
(147,181 sq km)

Capital
Kathmandu

Form of government
Constitutional monarchy

Major cities
Kathmandu, Biratnagar, Lalitpur, Pokhara, Birganj

Hinduism is the main religion. However, Hinduism and Buddhism have existed side by side in Nepal for centuries. Legends even say that the Buddha, the man who started Buddhism, was born in Nepal.

Economy

Nepal is one of the poorest countries in the world. Most of the people work in farming. Rice, corn, wheat, potatoes, and sugarcane are the main crops. Farmers also raise cattle, goats, buffalo, pigs, and sheep.

Factories in Nepal make clothing, carpets, and pashmina (a fabric of fine wool and silk). Other products include wood from the country's many forests and a plant fiber called jute. Tourism is another source of money for Nepal.

History

In ancient times Hindu kings from India ruled the Nepal region. In 1769 a ruler named Prithvi Narayan Shah conquered a number of small kingdoms. Shah's territory became the modern state of Nepal.

The Rana family took control from the Shah family in 1846. The Rana gave Great Britain some power in Nepal. A revolution forced out the Rana government in 1951. A Shah family member then took back power as king.

Birendra Shah became king in 1972. In 1990 there were many protests over the king's absolute power. A new constitution allowed political parties and established a two-house legislature.

A group of rebels began fighting the government in 1996. The rebels wanted to set up a Communist government.

In 2001 King Birendra's son shot and killed the king, other members of the royal family, and himself. King Birendra's brother Gyanendra then became king. He tried to take control of the government to stop the ongoing fighting by the rebels. This led to more protests. In 2006 Gyanendra gave up control, and the rebels signed a peace agreement with the government. The Nepalese people elected a new assembly in 2008. The new government then voted to declare Nepal a democratic republic.

Neptune

Neptune is one of the planets that orbit, or travel around, the sun in the solar system. It is a huge, distant planet that is deep blue in color. It is a stormy world. The planet has the fastest winds ever discovered in the solar system.

Neptune is about 3 billion miles (4.8 billion kilometers) from the sun. Neptune is the eighth and last planet from the sun. Pluto, a dwarf planet, is usually farther from the sun than Neptune. However, about every 228 years Pluto's path takes it closer to the sun than Neptune. Then Neptune stays beyond Pluto for 20 years. This last occurred from 1979 to 1999.

Physical Features

Neptune is nearly as big as its inner neighbor, the planet Uranus. Neptune's diameter, or distance through its center, is about 31,000 miles (50,000 kilometers). That is about four times as big as Earth's diameter.

Neptune is a kind of planet called a gas giant. It is made up mostly of gases, mainly hydrogen and helium. A small amount of the gas methane makes Neptune appear blue. The planet has no solid surface. Scientists think that Neptune has hot, thick liquids deep inside it.

A system of narrow rings surrounds Neptune. The rings are not as large as the rings of the planet Saturn. They are made up of dust.

The spacecraft Voyager 2 flew for 12 years before it got close enough to Neptune to send a clear photograph back to Earth. The planet's surface appears to be smooth because it is made of gas.

Orbit and Spin

Like all planets, Neptune has two types of motion: orbit and spin. Neptune orbits, or travels around, the sun very slowly. It takes Neptune about 165 Earth years to complete one orbit. In other words, a year on Neptune is equal to about 165 Earth years.

Neptune spins about its center rapidly. It completes one rotation in about 16 hours, so a day on Neptune lasts about 16 hours.

Moons

More than 10 moons orbit Neptune. Its largest moon, Triton, is nearly as big as Earth's Moon. Scientists believe that Triton might have formed as an independent planet. However, because of a

force called gravity, Neptune may have pulled Triton into its orbit.

Observation and Exploration

Neptune is a huge planet. However, it is so far away that people on Earth cannot see it without a telescope. In 1846 the German astronomer Johann Gottfried Galle discovered Neptune with a telescope. Only one spacecraft has visited Neptune. The unmanned U.S. spacecraft Voyager 2 flew by the planet in 1989.

Nervous System

Animals constantly use their senses to gather information about their surroundings. Nerves in the body pick up this information. In most animals the nerves send the information to the brain or a similar organ. The brain makes sense of the information. It then sends a message back through the nerves to tell the body how to react. This network of nerves and brain is called the nervous system.

Brain and Spinal Cord

In mammals and other animals with backbones the brain and the spinal cord form the central part of the nervous system. The spinal cord is a long bundle

Animals without a backbone have simple nervous systems. A flatworm (top) has nerve clusters instead of a true brain. A grasshopper (bottom) has a larger group of nerve clusters for a brain.

of major nerves. It runs from the brain down an animal's back. Nerves throughout the body carry information to and from the central nervous system.

Neurons

The nerve cells, or neurons, are the basic units of the nervous system. The human body contains billions of neurons. More than 10 billion neurons make up the brain.

Neurons have a nucleus, or center, and two or more long fibers, or threads. Impulses travel to and from the neurons along these fibers.

Neurons are not able to reproduce as some other cells do. They cannot divide themselves to create more neurons. Neurons in most of the body can regrow if they are slightly damaged. However, neurons in the brain and spinal cord cannot regrow at all. This is why severe

Did You Know?

Some types of nerve cells are several yards long.

Nerve cells, called neurons, include a nucleus (center) and two or more long fibers, or threads. Impulses travel between neurons along these fibers.

damage to the brain or the spinal cord is permanent.

Nerves

Nerves are bundles of neuron fibers. Nerves run throughout the body. Some nerves, called cranial nerves, run directly to the brain. The rest of the nerves connect with the spinal cord. The nerves in the spinal cord run to and from the brain.

There are two main types of nerves: sensory nerves and motor nerves. Sensory nerves handle information

The human nervous system includes the brain, the spinal cord, and the nerves that run throughout the body.

relating to the senses. They send information from the eyes, ears, mouth, nose, skin, and other body parts to the spinal cord and brain. Motor nerves carry messages in the other direction. They send information from the brain and spinal cord to muscles and other body parts.

For example, when a person touches a hot stove, the sensory nerves in the fingers send impulses to the spinal cord. The impulses say that the stove is too hot to touch. The spinal cord then sends impulses through motor nerves to the muscles of the arm. These impulses tell the muscles to pull the arm away from the stove.

Sensory nerves send messages from the eyes, ears, mouth, nose, skin, and other body parts to the spinal cord and brain. Motor nerves send messages from the brain and spinal cord to muscles and other body parts.

Autonomic nerves are a special type of motor nerve. These nerves control the organs inside the body. They regulate breathing, heartbeat, body temperature, the digestive system, and other activities.

Problems with the Nervous System

Many injuries and diseases can affect the nervous system. Damage to the spinal cord can lead to paralysis. When a person is paralyzed they cannot move. Paralysis happens because the damaged nerves block messages that tell the muscles to move. Multiple sclerosis and poliomyelitis are diseases that attack nerves. Alzheimer's disease and Parkinson's disease destroy neurons in the brain. Meningitis is a swelling of the thin coverings around the spinal cord and brain.

Nest

A nest is a structure in which an animal lives or keeps its young. Birds are well known for building nests for their eggs. Some fish, amphibians, reptiles, mammals, and insects also build nests.

Birds' Nests

Birds build nests in trees, in bushes, in caves, on high rock ledges, or on buildings. Some make nests on the ground or underground. Many birds build cup-shaped nests. Others make domed nests or nests that hang from tree limbs like

Some types of bird are called weavers because they weave their nests out of plant fibers.

long bags. The size of the nest depends on the type of bird. A hummingbird's nest is no bigger than a baby's fist. An adult person could lie down in the largest eagle's nest.

Birds use a wide range of building materials. Besides twigs and grass, they might use mud, feathers, plant fuzz, and bits of spiderweb. Some birds use their saliva to bind the materials together. Weavers are some of the most skilled nest builders. They make complex nests by weaving together long strands of grass with their beaks.

Nests of Other Animals

Most other animals build simple nests. Some fish hollow out nests in underwater gravel or sand. Other fish nest in plants. Frogs make nests out of mud or hardened froth that floats on the water's surface. Alligators build mounds of

grasses and mud. Cobras push together nests of leaves.

Many small mammals also build nests with plant material. Tree squirrels use twigs and leaves to build nests in trees. Rabbits, mice, moles, and gophers make their nests underground.

Insects that live together in colonies build some of the most elaborate nests. Ant and termite nests often have many long tunnels running underground. They also have separate chambers for the queen and the growing larvae, or young. Honeybee nests, or hives, have a core called a honeycomb. The honeycomb is made of many six-sided wax cells. This is where the queen bee lays her eggs. Paper wasps build paperlike nests out of wood that they have chewed up and spit out.

Paper wasps build nests with many cells, or compartments. Each cell holds one egg.

Netherlands, The

The Netherlands is a small country in northwestern Europe. It is also known as Holland. The people of The Netherlands are called the Dutch. The country's capital is Amsterdam. However, the government meets in the city of The Hague.

Geography

The Netherlands shares borders with Germany and Belgium. The North Sea lies to the west and north. The country includes the Caribbean islands of Aruba and the Netherlands Antilles.

The Netherlands is low-lying and mostly flat. Rivers and canals connect many of the cities. The climate is cool and rainy.

Much of the land near the coast used to be underwater. Beginning in the Middle Ages the Dutch drained the land using windmills and, later, pumps. They built barriers such as dikes and dams to keep

Windmills built in the 1700s line a waterway in Kinderdijk, The Netherlands.

the water out. The lands taken from the sea are called polders.

Plants and Animals

Forests cover only about 10 percent of the land. Animals include hedgehogs, moles, badgers, otters, and mice. Many sea and land birds also live in the country.

People

Dutch people make up most of the population. There are small groups of Turks, Indonesians, Moroccans, and others. About half of the people are Christians. Many people follow no religion. Dutch is the main language. About 90 percent of the people live in cities.

Economy

International trade and services are important parts of the economy. Many goods pass through The Netherlands on their way to and from other countries of western Europe. The Netherlands' major

services include banking, insurance, communications, and tourism.

Factories make food products, metals, chemicals, electrical machinery, transportation equipment, and petroleum (oil) products. The Netherlands also has large fields of natural gas.

Farmers grow vegetables, grains, potatoes, and sugar beets. They also raise pigs, cattle, poultry, and sheep. The Dutch produce many flowers, especially tulips.

History

Early History

The Roman Empire conquered the region more than 2,000 years ago. The area later divided into many small states. The lands that are now The Netherlands, Belgium, and Luxembourg became known as the Low Countries. In the 1400s the Low Countries came under the control of the Hapsburg family of Austria.

The Low Countries passed to the Hapsburg rulers of Spain in the 1500s. The Dutch began fighting Spain in 1568. In 1579 the Dutch set up the United Provinces of the Netherlands. The war continued until Spain accepted Dutch independence in 1648.

In the 1600s the Dutch built a large empire around the world. They set up colonies in North America, South America, Asia, and Africa. The Dutch fought many wars with England during this time.

A girl in The Netherlands wears traditional Dutch clothing and carries armfuls of tulips. The Dutch are famous for growing the flower.

Kingdom of The Netherlands

In 1795 the French invaded the Low Countries. After the French were defeated in 1815, the Kingdom of The Netherlands was created. Belgium and Luxembourg soon broke away to form separate countries.

Nazi Germany ruled The Netherlands during World War II (1939–45). The Germans sent away and killed most of the country's Jews.

After the war The Netherlands granted independence to its remaining colonies. They became the countries of Indonesia, Papua New Guinea, and Suriname. The Netherlands also joined the European Economic Community (now the European Union).

Nevada

The U.S. state of Nevada takes its name from a Spanish word meaning “snow-capped.” The name refers to the state’s high mountain ranges where snow remains throughout the year.

Nevada is sometimes called the Silver State because silver mining was once very important there. The nickname Sagebrush State comes from the state’s abundant growth of wild sage. The capital is Carson City.

Geography

Nevada is a Western state that is bordered on the north by Oregon and Idaho. It is bordered on the east by Utah, on the southeast by Arizona, and on the southwest and west by California.

Nevada has three natural regions. The largest region covers the majority of the state. It is characterized by rugged mountain ranges, long, flat valleys, and sandy deserts. There is a plateau, or raised, flat region, along the state’s northeastern edge. The third region is the Sierra Nevada mountain range in the west. It overlooks Lake Tahoe, the country’s largest mountain lake.

The Colorado River flows along the Arizona border. Boundary Peak is the highest point in the state at 13,140 feet (4,005 meters). The state’s weather varies with the landscape. It can be very cold in the high mountains and very hot in the desert.

People

Whites make up about two thirds of Nevada’s population. Hispanics represent about one fifth of the population. Almost 7 percent of the residents are African American, and about 5 percent are Asian.

Economy

Tourism and casinos are Nevada’s leading industries. Manufacturing is a small part of the economy. The state’s factories process food, make metal products, and produce plastics and rubber items.

Cattle are the primary source of income from agriculture. Dairy products and hay are also important. Southwestern Nevada is part of one of the richest min-

Rugged mountains and desert cover much of Nevada.

ing regions in the country. The state's most valuable mineral is gold.

History

The first European explorers in the area were Spanish missionaries and fur traders in the 1700s and early 1800s. They found several Native American tribes in the area: the Shoshone, the Northern Paiute, the Southern Paiute, and the Washo. The region was claimed by Spain until 1821 and by Mexico until 1848. The United States gained the area after the Mexican War (1846–48). The discovery of a large deposit of silver in 1859 attracted people from all over the world. Nevada was organized as a territory in 1861. It joined the Union as the 36th state on October 31, 1864.

Nevada's real prosperity did not come until after 1931, when the state legalized gambling. Nevada soon became known as a resort center. Also in the 1930s the

Hoover Dam was constructed on the Colorado River. The project provided many jobs for people in the area. The dam includes a power plant that generates electricity. This allowed more factories to open in the area and encouraged economic growth. The dam also created a large lake called Lake Mead.

In the 1950s the federal government made Nevada a major testing site for nuclear weapons. This encouraged the development of technical industries within the state. The main area of growth, however, was in the tourist trade. Many people travel to Nevada for entertainment in Las Vegas and Reno. Many others enjoy the scenery of the state and outdoor activities such as hiking in the mountains or boating on Lake Mead.

New Brunswick

New Brunswick is one of the four original Canadian provinces. It is located in eastern Canada. The beautiful coastline of New Brunswick gave the province its nickname, the Picture Province. New Brunswick's official name came from the British royal family of Brunswick. Its capital is Fredericton.

Geography

New Brunswick, Nova Scotia, and Prince Edward Island are known as the Maritime Provinces. New Brunswick is the largest of the three. Inlets of the Atlantic Ocean surround New Brunswick on three sides. A narrow strip of land connects the province with Nova Scotia. A bridge links New Brunswick to Prince Edward Island. Quebec and the U.S. state of Maine lie to the west.

People

Many of New Brunswick's people have English, Irish, Scottish, or French ancestors.

The Cape Enrage Lighthouse stands at the entrance to the Bay of Fundy in New Brunswick.

Later immigrants came from other parts of Europe and Asia. Small numbers of American Indians and blacks also live in the province.

English and French are both official languages of the province. Most of the people speak English. About one third speak mainly French. They live mostly in the north and east. The University of New Brunswick is Canada's oldest English-language university.

About half the people in New Brunswick live in cities. Saint John is the province's largest and oldest city. Farther north along the Saint John River sits New Brunswick's capital city, Fredericton. Moncton, the second largest city, is a port in the southeast.

Economy

Factories in New Brunswick produce a variety of goods, including food, paper, wood and metal products, and machinery. Forests, which cover much of the province, provide wood and pulp for paper. Tourism is an important service industry.

The province's waters offer many types of fish, lobsters, and crabs. Mines provide such metals as antimony, bismuth, lead, silver, and zinc. The land is also a source of peat and coal, both of which are used for fuel.

Only a small part of New Brunswick's land is used for agriculture, but farming is still important to the economy. The province is known for its potatoes. Eggs, poultry, berries, apples, and dairy products also come from the province.

History

New Brunswick's first people were Algonquian-speaking Indians, including the Micmac and the Malecite. In 1534 the French explorer Jacques Cartier landed on the east coast of what is now New Brunswick. In 1604 the French explorer Samuel de Champlain helped to establish the first French settlement in the region. French settlers gave the name Acadia to what are now New Brunswick and Nova Scotia.

In 1755 the British drove most of the French out of Acadia. Then the British started to settle in New Brunswick. During the American Revolution (1775–83) thousands of people from the American Colonies who remained loyal to the

The 1,282-foot (391-meter) covered bridge in Hartland, New Brunswick, is the world's longest covered bridge.

British moved to New Brunswick. They founded the city of Saint John. In 1784 the British separated New Brunswick from Nova Scotia and made it a separate colony. New Brunswick became known for shipbuilding.

Along with Nova Scotia, Ontario, and Quebec, New Brunswick became a province of the new country of Canada in 1867. Railroads built during the late 1800s helped New Brunswick's manufacturing industries to grow. New industries, including oil refining and power plants, developed in the 1900s. However, many young people left New Brunswick to work in the large cities in Quebec and Ontario.

New Deal

A poster from the 1930s advertises an art exhibit sponsored by the Works Progress Administration, a New Deal program.

The New Deal was a group of U.S. government programs of the 1930s. President Franklin D. Roosevelt started the programs to help the country recover

Men in the Civilian Conservation Corps work in the Saint Joe National Forest in Idaho.

from the economic problems of the Great Depression.

Some New Deal programs gave jobs to unemployed people. The Civilian Conservation Corps (CCC) put young men to work in national forests. The Works Progress Administration (WPA) created many different kinds of jobs. Some WPA workers built roads, schools, or airports. Others created art for public buildings or set up community theaters.

The best-known results of the New Deal include Social Security and the Tennessee Valley Authority (TVA). Social Security is a system that continues to provide income for retired or disabled workers. The TVA built dams and electric power plants on the Tennessee River. It still provides electricity to seven Southern states.

Other New Deal programs were supposed to fix some of the problems that led to the Great Depression. During the Great Depression many people lost money when banks closed. As part of the New Deal the government set up the Federal Deposit Insurance Corporation (FDIC). It was meant to get people to trust banks again. The FDIC pays people when their bank loses money or has to close.

Newfoundland and Labrador

Newfoundland and Labrador is Canada's easternmost province. The province includes the island of Newfoundland and a region called Labrador on the mainland of North America. Originally called simply Newfoundland, the province has been known as Newfoundland and Labrador since 2001. The capital of the province is Saint John's.

Geography

The island of Newfoundland lies in the Atlantic Ocean. The narrow Strait of Belle Isle separates the island from Labrador, to the northwest. Quebec, New Brunswick, Prince Edward Island,

and Nova Scotia lie to the west and southwest.

Many bays and coves line Newfoundland's coast. The Long Range Mountains run through the west. At the island's southeast corner is the Avalon Peninsula, the easternmost point in North America.

Labrador is a rugged chunk of land that borders northeastern Quebec. It is more than two and a half times the size of Newfoundland. The Torngat Mountains in the north include some of the highest peaks in eastern Canada.

People

The majority of the province's people live on the island of Newfoundland. Most of the people's ancestors came from England or Ireland. Smaller numbers of residents have Scottish, French, American Indian, or Eskimo (Inuit) origins. Nearly everyone speaks English, but some people speak mainly French.

Saint John's, located on the Avalon Peninsula, is the province's only large city. Built in the early 1600s, Water Street in Saint John's may be the oldest street in North America. The one university in the province, Memorial University, is also in Saint John's. Labrador City is an important mining center in southwestern Labrador.

Many scenic villages lure tourists to the island of Newfoundland.

Economy

Services, including finance, public administration, and health, are the largest part of the province's economy. Oil reserves and iron, gold, copper, and nickel mines also bring in billions of dollars. Fishing is an important part of the economy. Factories produce wood, paper, and fish products. Construction and tourism are growing industries.

Because the province has a short growing season and little fertile land, there are few farms.

History

Among the first people of Labrador were Algonquian-speaking Indians called the Innu. The Eskimo also lived in Labrador before Europeans arrived. The Beothuk Indians lived on Newfoundland. The last known Beothuk died in the 1800s.

The first Europeans to visit Labrador were the Vikings, who were sailors from northern Europe. Some Vikings had

settled on the island of Greenland, to the east of Newfoundland. In about AD 1000 a few Vikings sailed west, discovered Newfoundland, and built a settlement there. The settlement lasted only a few years.

In 1497 the Italian explorer John Cabot landed somewhere in Newfoundland and Labrador or on a nearby island. He described the place he landed as the "new founde lande." England, France, and Portugal soon fought over the right to fish there. By the 1700s Newfoundland belonged to England. During the 1800s the island became a self-governing part of the British Empire.

In 1927 Newfoundland gained control of Labrador. Newfoundland stayed apart from Canada until 1949, when it became the 10th Canadian province.

New Hampshire

Residents of the U.S. state of New Hampshire are proud of their New England history. New Hampshire is named after the English county of Hampshire. It received its name in 1629, only a few years after it was first settled by the English. About 150 years later New Hampshire was the first of the 13 American Colonies to declare independence from England.

New Hampshire is nicknamed the Granite State because of its granite resources. Granite is a hard, gray stone that is used in building projects. The state capital is Concord.

Geography

New Hampshire is located in the north-eastern part of the United States. It is

bordered on the north by the Canadian province of Quebec, on the west by Vermont, on the south by Massachusetts, and on the east by Maine and the Atlantic Ocean.

The White Mountains cover the northern third of the state. They are part of the Appalachian mountain range. Most of the southern two thirds of the state is a region of low mountains, lakes, and fertile river valleys. New Hampshire's winters are long and often very cold. The summers are pleasantly warm.

People

Almost all of New Hampshire's residents are white and of European descent. Hispanics are the largest minority group in the state. They account for about 2 percent of the population. New Hampshire's earliest European settlers came from England. Scots-Irish settlers began to arrive in about 1719. During the 1800s and 1900s, immigrants came to the state from central and eastern Europe.

Economy

The economy of New Hampshire is based mainly on services and manufacturing. Manufacturing firms in the state create computer products and electronic equipment. Other businesses manufacture metal, rubber, and plastic products. Finance and real estate are some of the important parts of the service industry. Tourism is also a major part of the service industry. Many people travel to

New Hampshire to enjoy the scenery of the mountains.

The leading sources of agricultural income are dairy products and such nursery and greenhouse crops as flowers and shrubs. New Hampshire's maple trees provide maple syrup and maple sugar.

History

The Pennacook were the most powerful Native American tribe living in the region before European settlers arrived. The first European settlement was established by the English in 1623.

In 1641 New Hampshire came under the control of the colonial government of Massachusetts. New Hampshire became a separate province in 1679, but boundary disagreements with Massachusetts continued into the 1700s. In 1741 the first governor of New Hampshire was appointed.

New Hampshire patriots captured a British military post in 1774—several

months before the start of the American Revolution (1775–83). New Hampshire also declared itself independent from Britain several weeks before the Declaration of Independence was signed on July 4, 1776.

New Hampshire also played an important role in the early years of the United States. On June 21, 1788, the state cast the deciding vote to approve the new U.S. Constitution.

In the 1800s New Hampshire became a manufacturing state. Manchester developed into a center of the textile industry, and Portsmouth became known for shipbuilding.

In the early 21st century New Hampshire began producing new goods that helped its economy grow. These included high-technology products such as circuit boards and semiconductor devices, which make electronics run.

New Jersey

Early settlers from England named the colony of New Jersey after the island of Jersey in the English Channel. When it became a state New Jersey gained the nickname of the Garden State. At the time it had many farms in the west and south. Although it is one of the country's smallest states in area, it has one of the largest populations. In fact, New Jersey is the most densely populated state in the United States. The capital is Trenton.

Geography

New Jersey is located in the Middle Atlantic region of the United States. It is surrounded by water on all sides except for a northern border it shares with New York. The Atlantic Ocean lies to the east. The Hudson River separates New

Jersey from New York City in the northeast. To the west across the Delaware River are Pennsylvania and Delaware.

The southern part of New Jersey is covered by a coastal plain. Much of this area is marshland. North of the coastal plain is a region of rolling upland. Farther north is a region of wooded hills. In the northwest corner of the state are the Kittatinny Mountains, which are part of the Appalachian mountain range. New Jersey has a humid climate with cold winters and warm summers.

People

Whites of European heritage account for about three fourths of New Jersey's population. Italian Americans are the largest ethnic group in New Jersey. The state also has large communities of Germans, Russian and eastern European Jews, Irish, Poles, Hungarians, Puerto Ricans, and Cubans. African Americans and Hispanics each make up about 14 percent of the population.

The most crowded part of New Jersey is the northeast, which is near New York City. New Jersey's four largest cities—Newark, Jersey City, Paterson, and Elizabeth—are part of the New York City metropolitan area.

Economy

New Jersey is a center for scientific and technological research. It is one of the country's leading producers of chemicals

and pharmaceuticals. The state economy also depends on service industries such as insurance, finance, and tourism.

New Jersey is a major producer of fruits and vegetables. Its major fruits are cranberries, blueberries, and peaches. Important field crops are soybeans, corn, and hay. Dairy products are also valuable.

History

The Lenni Lenape (or Delaware) Indians lived in the New Jersey area before European settlers arrived. In 1524 the Italian explorer Giovanni de Verrazano became the first European to land in the area. Henry Hudson, an Englishman exploring for the Dutch, arrived in 1609. Dutch and Swedish traders established the first settlements in the area.

England took over the region in 1664. In 1676 the province was divided into East and West Jersey. New Jersey was reunited as a royal colony in 1702, under the governor of New York. It was separated from New York in 1738.

New Jersey was the site of many battles during the American Revolution. In two

of the most important battles, George Washington defeated the British at Trenton and Princeton in late 1776 and early 1777.

At the Constitutional Convention of 1787, New Jersey called for each state, regardless of size, to have the same number of representatives in the U.S. Congress. This idea, called the New Jersey Plan, was designed to help small states. The plan helped lead to the creation of the Senate as one of the two houses of Congress. Each state has two members in the Senate.

Between the Revolution and the American Civil War (1861–65) New Jersey underwent great industrial development. During and after both world wars, in the first half of the 20th century, there was further growth of factories. The factories helped the economy by offering jobs to many people. However, they also led to major problems with pollution. In the 21st century the state tried to address those problems.

New Mexico

Nicknamed the Land of Enchantment, the U.S. state of New Mexico is graced with desert and mountain landscapes of great beauty. It is located in the southwestern United States and shares a border with the country of Mexico. Because of its location and history, New Mexico is a blend of three cultures—Native American, Spanish American, and American. The state capital is Santa Fe.

Geography

New Mexico is bordered by Arizona on the west and Colorado on the north. Oklahoma and Texas are on its eastern border, and Texas and Mexico are to the south.

The Rocky Mountains cover the north-central region of the state. Eastern New Mexico is a high plains region. Most of

the rest of New Mexico has many short mountain ranges. In the northwest is a region of mesas, or flat-topped hills. There are two major rivers, the Rio Grande and the Pecos. New Mexico has a dry and pleasant climate with lots of sunshine.

People

Unlike most states, New Mexico has large Hispanic and Native American populations. More than two fifths of New Mexico's population is of Spanish origin. About half of this group are Mexican Americans. The others are descendants of the original Spanish settlers. Whites with roots in other European countries make up another two fifths of the population.

Native Americans make up about one tenth of the state's population. The largest tribes are the Pueblo and the Navajo. Other tribes include the Zuni, the Apache, and the Ute.

Economy

Manufacturing in New Mexico includes the production of electronic equipment, food processing, and oil refining. The federal government conducts military and energy research at laboratories in Los Alamos and Albuquerque. The U.S. military tests missiles and electronic systems at several bases. Tourism is also important to the economy.

The sale of cattle and dairy products are the state's largest sources of agricultural

income. New Mexico is rich in minerals and energy resources. It is among the leading states in the production of petroleum (oil) and natural gas.

History

Native American villages dotted New Mexico long before Spanish explorers and missionaries arrived. In 1540 the Spaniard Francisco Coronado entered the area while searching for legendary cities of gold. Santa Fe was founded in 1610. An Indian uprising in 1680 forced the Europeans out for a time, but by 1700 the Spanish had returned.

The land that is now New Mexico became part of Mexico when that country gained its independence from Spain in 1821. By that time the trade route known as the Santa Fe Trail had increased business dealings between New Mexico and the United States. After Mexico's defeat in the Mexican War (1846–48), New Mexico was trans-

ferred to the United States. In 1850 the U.S. Congress created the Territory of New Mexico.

Native Americans and white settlers in the area often fought one another. The Apache were particularly feared for their attacks on settlements and wagon trains. During the late 1800s the Native American tribes were defeated and forced to settle on reservations.

New Mexico was admitted to the Union in 1912 as the 47th state. During World War II (1939–45) the world's first atomic bomb was built in Los Alamos. It was tested on July 16, 1945, near Alamogordo. The population of New Mexico has grown rapidly since the 1950s. Between 1990 and 2008 the state's population increased by more than 30 percent.

Acoma is a Native American village on top of a high mesa in New Mexico. It was first settled more than 1,000 years ago. Acoma people still live in the village today.

New South Wales

New South Wales is one of Australia's six states. It is rich in natural beauty, historical places, and modern businesses. Australia's largest city, Sydney, is the capital of New South Wales. The state also contains the Australian Capital Territory, where the country's capital, Canberra, is located.

Geography

New South Wales lies in southeastern Australia. The Pacific Ocean borders the state on the east. Three states border New South Wales: Victoria on the south, South Australia on the west, and Queensland on the north.

Mount Kosciuszko, Australia's highest point, is about 100 miles (160 kilometers) southwest of Canberra. It rises 7,310 feet (2,228 meters). The Darling, Australia's longest river, cuts across the northwest. Other major rivers of New South Wales include the Murray and the Murrumbidgee.

The coast of New South Wales has a moist climate, with mild winters and warm summers. The inland area is dry, with mild winters and hot summers.

People

Most people in New South Wales have British or other European ancestors. Other groups include Turks, Lebanese, Chinese, Vietnamese, Thais, and Indonesians. Australia's native people, called Aborigines, make up about 2 percent of the population.

More than 6 million people live in New South Wales. About 4 million live in Sydney, on the coast. Sydney is a major center of business and the arts. The magnificent Sydney Opera House, with its shell-like roofs, has become a symbol of Australia. Other important cities in New South Wales include Newcastle, Wollongong, Broken Hill, Wagga Wagga, and Lismore.

Economy

New South Wales produces more goods and services than any other state in Australia. Services, such as banking and

A rock formation called the Three Sisters rises above a cliff in the Blue Mountains, New South Wales.

Did You Know?

The Summer Olympics took place in Sydney, New South Wales, in 2000.

tourism, are the main parts of the economy. Farmers in the state mainly raise animals, especially sheep for wool. New South Wales also produces much of Australia's grain, including wheat, corn, and sorghum. In addition, most of the country's silver, lead, and zinc comes from mines in New South Wales.

History

The British explorer James Cook discovered New South Wales in 1770. He claimed the territory for King George III of Great Britain. The area reminded Cook of southern Wales in Great Britain, so he named it New South Wales.

The British government set up a colony at Sydney Harbour in 1788. Many of the people who lived there were prisoners sent from Great Britain. The colony grew slowly until gold was discovered in 1851. The gold rush that followed brought many people to the area.

When Australia became an independent country in 1901, New South Wales became a state of Australia. The current state borders were set up in 1915.

Newspaper

Many people read newspapers for information on important events. Newspapers are usually published regularly, such as every day, week, or month. By the late 20th century Europe had more than 2,600 daily newspapers, and Asia had

more than 2,500. There were some 2,200 dailies in North America, more than 760 in South America, and nearly 160 in Africa.

The core of a newspaper is its stories about local, national, and international news. Many newspapers also contain columns in which people offer their own opinions and interpretations of events. Other articles may cover entertainment, business, travel, and sports. Most newspapers also have advertisements.

Producing a Newspaper

It takes many different people to publish a newspaper. Editors decide which stories should be written. Reporters research and write stories. Photographers take pictures. Businesspeople handle subscriptions and advertising. And many other people help write, design, print, distribute, and sell the newspaper.

Gathering enough information to fill a newspaper was often difficult and expensive until the creation of news services. News services collect information from around the world and sell it to

Newspapers are published in many countries and in many languages.

A newspaper rolls off the printing press. Other machines will cut and fold the pages.

many different newspapers. The Associated Press and Reuters are two well-known news services.

History

Before printing was invented, each copy of a text had to be written by hand. That process was costly and took a lot of time. In the mid-1400s Johannes Gutenberg invented a printing press that made it possible to print words on paper quickly. After that, newsletters and pamphlets were published in Europe. In the 1600s newspapers similar to today's appeared in Europe and Japan. The first regular newspaper in what is now the United States appeared in 1704.

In 1791 the First Amendment to the U.S. Constitution guaranteed freedom of the press in the United States. Some countries, however, still ban newspapers or prevent them from publishing stories that criticize the government.

The invention of computers in the 1900s greatly changed the newspaper business. Today writers can quickly send stories to publishers through e-mail. Editors and designers can easily change the content and look of articles using computers. And many people now read newspaper articles on the Internet, rather than in a printed copy.

Newton, Isaac

Isaac Newton was one of the great figures in the history of science. His ideas about motion and gravity are very important to the science of physics.

Isaac Newton was born on December 25, 1642, in Woolsthorpe, England. In 1661 he enrolled at Cambridge Univer-

An engraving shows Isaac Newton using a prism to separate sunlight into colors.

sity. There he became interested in new scientific ideas that were coming out of Europe. They included the idea that Earth and the other planets travel around the sun. This idea challenged the long-held belief that Earth was the center of the universe.

After Newton graduated from college, he continued to study and do experiments on his own. His first great discovery came from his experiments with light. He found that when white light passes through a prism, or triangular piece of glass, it breaks up into a band of colors. Newton concluded that white light is a mixture of colors.

Newton also wanted to know what keeps the Moon in its orbit, or path, around Earth. He thought that only an attraction, or pull, between Earth and the Moon could explain it. This pull is called gravity. Newton's work showed how gravity controls the motion of the planets around the sun as well as the motion of the Moon. As he studied gravity and motion, Newton also made important contributions to mathematics.

From 1669 to 1701 Newton was a professor at Cambridge. In 1703 he was elected president of a major scientific group called the Royal Society. In 1705 the queen of England made him a knight. Newton died in London, England, on March 20, 1727.

New Year's Day

A crowd in New York City celebrates the arrival of a new year.

People around the world celebrate the start of a year on New Year's Day. In Europe, North America, and South America most people celebrate New Year's Day on January 1. In the United States many traditions surround New Year's Day. On the night before, called New Year's Eve, people stay up late and count down the seconds until midnight. Many people make New Year's resolutions, or promises to themselves. They see New Year's Day as a chance to make a fresh start.

People of other places and cultures observe the new year at times other than January 1. The Chinese New Year, for example, is celebrated for a month beginning in late January or early February. In Iran New Year's Day is in March, on the first day of spring. Followers of the Jewish religion celebrate the new year, called Rosh Hashana, in the fall.

Did You Know?

Newton was buried in a London church called Westminster Abbey. Burial in Westminster Abbey is a high honor.

New York

The Adirondack Mountains cover the northern part of New York State.

Few places in the United States rival New York State in terms of population, culture, and economic importance. Only the states of California and Texas have larger populations. New York City—with more than 8 million people—is the country's largest city. New York State's economic production is higher than that of most of the world's countries.

New York was one of the original 13 colonies. The colony was named after the English Duke of York. The nickname of the Empire State is thought to have come from a remark made by George Washington. In 1784 he referred to New York as the “seat of empire.” The capital of New York is Albany.

Geography

New York is located in the northeast section of the United States. From southwest to northeast, New York is bordered by Lake Erie, the Canadian

province of Ontario, Lake Ontario, and the Canadian province of Quebec. To the east are the states of Vermont, Massachusetts, and Connecticut. The Atlantic Ocean and New Jersey are to the southeast. Pennsylvania is to the south.

New York's largest natural region is the Appalachian Mountains, which cover about half of the state. The Appalachian region extends westward from the Hudson River valley to the state's southern and western boundaries.

A lowland region runs northward along the Hudson River to Albany and then westward along the Mohawk River. A raised, flat region lies north of the Appalachians and west of the Mohawk River valley. It extends along the southern shores of the Great Lakes. The state has several islands off the Atlantic coast. The largest ones are Manhattan,

Niagara Falls is a group of waterfalls on the Niagara River, which flows between New York State and Canada.

Staten Island, and Long Island. New York generally has warm summers and cold winters.

People

The population of New York is as varied as that of the United States itself. Members of every ethnic group entering the country passed through immigration stations such as Ellis Island, in New York Bay. Many remained in the state. Immigrants are still a major part of New York's culture—one fifth of the state's current population was born in a foreign country.

New Yorkers of European heritage account for about two thirds of the

state's population. New York's largest minority groups are African Americans and Hispanics—each group makes up more than 15 percent of the population. About 5 percent of New York's residents are of Asian heritage.

Economy

New York companies are involved in every type of economic activity. The state's economy and jobs are now dominated by service industries such as commercial trade, government, education, and tourism, however. New York City is the chief financial center of the country. It is home to the major U.S. stock exchanges and the headquarters of many major businesses.

The largest manufacturing industries in New York are chemicals, machinery, and food processing. Dairy farms account for more than half of New York's farm income.

History

Algonquian and Iroquois tribes lived in the New York region when Europeans arrived. The Algonquian tribes included the Mohican and the Munsee. The five Iroquois tribes were the Mohawk, the Oneida, the Onondaga, the Cayuga, and the Seneca.

The first European to visit the area was probably an Italian explorer, Giovanni da Verrazano, in 1524. In 1609 Henry Hudson sailed up what was later named the Hudson River and claimed the land for the Netherlands. The Dutch established the colony of New Netherland in 1624. The next year they founded the city of New Amsterdam. In 1664 the British took control of New Netherland and renamed it New York.

New York was a major battleground during the American Revolution (1775–83). One notable battle, at Saratoga, was considered the turning point of the war. New York became the 11th state in the Union when it approved the new U.S. Constitution on July 26, 1788.

The Erie Canal opened in 1825. The artificial waterway connects the Hudson River with Lake Erie. It was built to provide a way for ships to get from the Atlantic Ocean to the Great Lakes. This gave New York a link to the growing midwestern states. About half a million New Yorkers fought for the North during the American Civil War (1861–65). After the war new machinery and methods of producing goods quickly made the state a great manufacturing and trade center.

After World War II (1939–45) new highways, airports, and bridges made New York a center of transportation. In 1952 New York City became the headquarters of the United Nations, an organization dedicated to improving international relations. The city's international significance, however, made it a target of terrorism. On September 11, 2001, terrorists flew two hijacked planes into twin skyscrapers called the World Trade Center. The buildings were destroyed and almost 3,000 people were killed. The city and state worked hard to recover from the tragedy.

New York City is the largest city in the United States. It is one of the world's great centers of culture and business. Its constant activity earned it the nickname "the city that never sleeps."

New York City is located in the state of New York. The city is made up of five districts called boroughs: Manhattan, Brooklyn, the Bronx, Queens, and Staten Island.

Places of Interest

New York City is packed with world-famous sites. The Statue of Liberty is located in its bay. The Empire State Building is the best-known skyscraper in

The Statue of Liberty stands on Liberty Island in New York Bay.

the Manhattan skyline. The huge Central Park lies near the heart of Manhattan.

The Lincoln Center for the Performing Arts is home to the city's world-class orchestra, ballet, and opera companies. The Broadway area is famous for its many theaters.

Economy

New York City's economy is based mainly on services. The Wall Street district is one of the world's major centers of finance and banking. The city is a leader in publishing, television, and fashion. Tourism, trade, advertising, and computer industries are also important.

History

New York City began in the 1620s as a Dutch trading post. The Dutch took control of Manhattan Island from the Algonquian Indians who lived there. The British took over the Dutch settlement in 1664.

New York City grew as a trade center. By 1790 it was the largest city in the newly created United States. In the 1800s and 1900s millions of immigrants entered the United States through Ellis Island, in New York Bay.

In recent times New York City was a target for terrorists. The worst attack came in September 2001, when hijackers crashed airplanes into the World Trade Center. Nearly 3,000 people were killed.

New Zealand

New Zealand is a country made up of islands in the South Pacific Ocean. The Maori people lived on the islands for hundreds of years before Europeans arrived in the 1600s. New Zealand's capital is Wellington.

Geography

New Zealand lies about 1,000 miles (1,600 kilometers) southeast of Australia. It is the farthest south of all the countries in the region called Oceania. New Zealand's two main islands are called the North Island and the South Island.

Mountains cover much of the islands. On the South Island the Southern Alps contain the country's highest peak, Mount Cook, and many glaciers. New Zealand's longest river, the Waikato, is on the North Island. The islands have many harbors and fjords, or narrow arms of water with steep sides.

New Zealand has a mild climate with plenty of rain. It snows only in the mountains.

Plants and Animals

European settlers cut down many of the islands' original evergreen forests. In the 1900s New Zealanders began planting new forests of pine trees.

New Zealand's native animals include reptiles, frogs, and bats. The early Maori settlers brought dogs and rats. European

settlers brought red deer, opossums, and rabbits.

New Zealand has several types of flightless birds, including takahes, penguins, and kiwis. The kiwi bird is New Zealand's national symbol.

People

Most of the population has a European background. About 10 percent of New Zealanders have Maori ancestors. The country also has small groups of Asians and people from other Pacific islands. Both English and Maori are national languages. More than half of New Zealanders are Christians. Most New Zealanders live in cities and towns, mainly on the North Island.

Economy

Only a small portion of New Zealanders are farmers. Nevertheless, New Zealand's economy depends on agricul-

ture. Farmers raise many sheep and cattle. They grow apples, barley, wheat, and corn. Fishing and logging are also important to the economy. New Zealand sells wool, dairy products, meat, wood, paper, and fish to other countries.

Besides food and wood products, New Zealand's factories make cloth, machinery, and metal goods. Mines produce iron ore, gold, coal, limestone, and natural gas. Most New Zealanders work in services, including banking, insurance, and tourism.

History

The Maori came to New Zealand from islands in Polynesia, a region of the southeastern Pacific. They probably reached New Zealand by AD 800.

European Contact

In 1642 a Dutch sailor saw New Zealand but did not land. The British explorer James Cook arrived in 1769. European whale and seal hunters soon came to the islands.

In 1840 the Maori accepted rule by Great Britain. The British promised to protect the Maori's rights to their land. However, European settlers soon demanded that the Maori sell their land. The British and the Maori fought wars until the 1870s. The Maori lost most of their best land.

In 1907 New Zealand became a separate state within the British Empire. In 1947 New Zealand gained full independence from Britain. New Zealand stayed a member of the Commonwealth of Nations, a group of countries with friendly ties to Britain.

Modern New Zealand

In the late 20th and early 21st centuries New Zealand increased its trade with Australia, other Pacific countries, and the United States. The government also began to give some land back to the Maori.

Nez Percé

Chief Joseph was a great leader of the Nez Percé in the 1800s.

The Nez Percé are a Native American people who traditionally lived along the Snake River. The area where they lived is now Idaho, Oregon, and Washington.

The tribe's main source of food was salmon. The Nez Percé also gathered roots and berries and hunted deer and rabbits. Early in the 1700s they got horses and began to hunt bison (buffalo). In winter the Nez Percé lived in large, wood-framed lodges. On summer hunting trips they built tentlike houses.

The Nez Percé knew only other Native Americans until 1805. In that year the U.S. explorers Meriwether Lewis and William Clark entered Nez Percé lands. By the 1840s many white settlers were traveling through the territory.

Conflicts between some Nez Percé and the settlers led to the Nez Percé War of

1877. The Nez Percé were defeated. Some of them were sent to Oklahoma and later to a reservation in Washington state. Most of the other Nez Percé remained on a reservation in Idaho. In the late 20th century there were about 4,000 Nez Percé living in the United States.

Niger

Nicaragua

The largest country in Central America is Nicaragua. Its capital is Managua.

Geography

Nicaragua is next to Honduras and Costa Rica. The Caribbean Sea is on the east, and the Pacific Ocean is on the west. The eastern part of the country is a swampy area called the Mosquito Coast. Mountains rise in central Nicaragua. The west has volcanoes and Lakes Nicaragua and Managua. The climate is generally warm. Earthquakes and hurricanes are common.

Plants and Animals

Nicaragua has tropical forests with cedar, mahogany, and other trees. Wild animals include pumas, jaguars, monkeys, anteaters, snakes, and tropical birds.

People

Most of Nicaragua's people have mixed European (mostly Spanish) and American Indian ancestors. Whites and blacks

make up about a quarter of the population. Most of the people are Roman Catholics. Spanish is the main language.

Economy

Nicaragua is a poor country. Many people work in agriculture, forestry, or fishing. Nicaragua sells coffee and sugar to other countries. Other crops include bananas, cotton, rice, corn, and beans. Factories produce chemicals, machinery, clothing, and petroleum products. Mines provide gold, copper, and silver.

History

Indians have lived in what is now Nicaragua for thousands of years. The Spanish established settlements there in the early 1500s. Many of the Indians died from European diseases. The Spanish sold others into slavery.

In 1821 Nicaragua became independent from Spain. It first joined the new Mexican Empire and then a union of Central American states. Nicaragua became a separate republic in 1838.

Many of Nicaragua's presidents were dictators, or rulers with unlimited power. In 1979 a rebel group called the Sandinistas took over the government. A group called the *contras* fought the Sandinistas. The Sandinistas lost power in a free election in 1990.

Nicholas II

The last tsar, or emperor, of Russia was Nicholas II. His reign came to an end in 1917 when revolutionaries took over the government. Soon afterward, Russia became the Soviet Union, a Communist country. (Communism is a political system in which the people share all property.)

Early Life

Nicholas II was born on May 18, 1868, at Tsarskoye Selo in Russia. His family name was Romanov. Tutors educated Nicholas. In 1894 he became tsar. Soon afterward he married a German princess named Alexandra.

Reign

As tsar, Nicholas did not understand that the common people wanted to have

a say in the government. After a rebellion in 1905, he agreed to create a house of representatives called the Duma. But Nicholas did not allow the Duma to have much power. The people became even more angry.

Nicholas did not get along with other countries either. His greatest conflict was with Japan. The result was the Russo-Japanese War (1904–05), which Russia lost.

In 1914 Russia entered World War I. While Nicholas led the army, he paid little attention to the running of government. Instead power passed to Alexandra. She was greatly influenced by a monk named Rasputin. However, he made bad decisions, and many good government officials were dismissed. Finally, in 1917 the angry Russians began the Russian Revolution.

Russian Revolution

Riots broke out in Petrograd (now Saint Petersburg) on March 8, 1917. Nicholas sent soldiers there, but it was too late. The Duma, supported by the army, forced the tsar to step down. The new leaders of Russia took Nicholas, Alexandra, and their five children prisoner.

Soon afterward, a group of Communists, called Bolsheviks, took over the government. The Bolsheviks killed Nicholas and his family on July 17, 1918.

Did You Know?

Under the rule of Nicholas II, the Trans-Siberian Railroad was finished. It runs more than 5,700 miles (9,100 km) across Russia.

Nicholas II and his wife had five children. Communists killed the entire family because they did not want anyone ever to claim to be the emperor or empress of Russia.

Nicosia

Population

(2005 estimate), Greek Nicosia, urban area, 219,200; (1996 census), Turkish Nicosia, 39,176

Nicosia is an ancient city that has had many rulers. Today it is the capital of Cyprus, an island country in the Mediterranean Sea. Cyprus is divided into two sections. The island's Greek residents control the southern section. Their government is the official government of the island. Turkish residents control the northern section. Only Turkey considers the Turkish section to be a separate country. Nicosia is the capital of both parts of Cyprus. Part of the city lies within the Greek section, and part lies

within the Turkish section. The Greek name for the city is Lefkosía. The Turkish name is Lefkosa.

Tourism and other service industries are important to Nicosia's economy. Factories in the city make such products as cloth, clothing, and processed foods.

Nicosia was part of the Byzantine Empire from 330 to 1191. During that period the city became the capital of Cyprus. The Ottoman Turks ruled Cyprus from the late 1500s to the late 1800s. Great Britain took control in 1878.

In 1960 Cyprus became an independent country with Nicosia as its capital. A few years later groups of Greeks and Turks began fighting in the city. The Greeks left the Turkish parts of Nicosia, and the Turks left the Greek areas.

Niger

Niger is a large country in West Africa. It covers parts of the Sahara Desert and the dry Sahel region to the south. The capital is Niamey.

Niger borders Algeria, Libya, Chad, Nigeria, Benin, Burkina Faso, and Mali. The land in the north is a high desert. Most rivers in Niger flow only during the short rainy season. Niger is one of the hottest countries in the world.

Northern Niger has few plants. Grasses, palms, and acacia and baobab trees grow in the south. Animals in the south include elephants, giraffes, gazelles, hyenas, and lions.

Niger's many peoples include the Hausa and the Songhai, who are mainly farmers. The Fulani and the Tuareg peoples are mainly herders who move from place to place. The national language is French, but most people speak an African language. Islam is the main religion.

Some of the people in Niger live in villages of small round houses.

Niger is a poor country. Most people work in agriculture. Farmers grow cow-peas, cotton, sugarcane, peanuts, onions, and grains. Herders raise goats, sheep, cattle, and camels. Niger's main industry is uranium mining.

In early times the Songhai and Kanem-Bornu controlled southern Niger. The Hausa and the Fulani later ruled. The Tuareg controlled the north. Europeans explored the region in the 1800s. France made Niger a colony in 1922.

Niger won independence in 1960. Since then the military has taken over the government several times. Niger held its first democratic elections in 1993.

Nigeria

More people live in Nigeria than in any other African country. Its land is rich in oil and natural gas. Abuja is the capital.

Geography

Nigeria lies in West Africa. It borders Benin, Niger, Chad, and Cameroon. The Atlantic Ocean lies to the south.

Nigeria has plains in the north and south. In the center there are hills and plateaus, or high, flat lands. Nigeria has two major rivers, the Niger and the Benue. Lake Chad lies across the country's northeastern border. Nigeria is warm with rainy and dry seasons.

Plants and Animals

Swamps and mangrove trees line Nigeria's coast. Tropical rain forests grow in the southwest. In the center of the country are woodlands and open grasslands. Grasses and scattered trees grow in the dry north.

A student in Ibadan, Nigeria, reads the Koran (the holy book of Islam).

Many antelope, giraffes, hyenas, lions, leopards, and elephants once lived in Nigeria. There were also many monkeys, gorillas, and chimpanzees. Most of these animals now live mainly in national parks. Nigeria's other wild animals include snakes, crocodiles, and hippopotamuses. Ostriches, storks, parrots, and toucans also live in the country.

People

There are about 250 ethnic groups in Nigeria. Each has its own customs and language. The four largest groups are the Hausa, the Yoruba, the Igbo, and the Fulani. More people speak Hausa than any other language. English is the language of the government.

About half of the population is Muslim, and nearly half is Christian. More than half of the people live in rural areas.

Economy

Nigeria is the largest producer of oil in Africa. The country also has deposits of natural gas, coal, and tin. Nigeria's factories make food products, cloth, cement, chemicals, and other goods.

Many Nigerians are farmers. They raise goats, sheep, cattle, and pigs for meat. They also grow sorghum, yams, millet, cassava, corn, peanuts, rice, and other crops. Nigeria sells cocoa beans and natural rubber to other countries. Fishing and logging are also important.

History

People have lived in the Nigeria region for thousands of years. The Nok people lived on the central plateau about 2,000 years ago. Later the Yoruba settled in the west, the Hausa and Fulani in the north, and the Igbo in the southeast. Many kingdoms rose and fell.

The Portuguese reached the Nigerian coast in 1472. By the 1600s British slave ships had arrived. The slave traders captured millions of Nigerians and sent them to the Americas. The British made the slave trade illegal in 1807.

By about 1900 the British controlled most of the region. In 1914 they created a single colony out of what had been many independent states. Nigeria gained independence in 1960.

Groups in Nigeria fought for power. The military took over the government in 1966. A civil war broke out in 1967 and lasted until 1970. Military groups controlled Nigeria until 1999. In that year Nigeria held democratic elections. However, violence and protests continued into the 21st century.

Nightingale

A nightingale perches on the end of a branch.

The nightingale is a small, plain-looking bird with a big voice. Many people think its highly varied, musical songs are beautiful. Sometimes people call other birds with musical songs nightingales. But most often the name refers to the Eurasian nightingale. This songbird is in the same family as thrushes, robins, and bluebirds.

Nightingales live in the woodlands. They prefer low bushes to tall trees. These birds nest throughout much of Europe and western Asia. They fly to warmer central Africa for the winter.

The nightingale is about 6.5 inches (17 centimeters) long. It has a brown body, a reddish tail, and a cream-colored belly and chest. Nightingales use their slender bills to eat insects and worms that they find on the ground.

The nightingale's song is most often heard during spring and early summer. This period is the mating and nesting

season. At this time the male may sing at any hour. The female builds a cup-shaped nest out of dry leaves, twigs, and grass. She lays four to six eggs, which hatch in about two weeks.

Nightingale, Florence

Florence Nightingale was a pioneer in the field of nursing. She improved the care of sick and wounded soldiers. She also made nursing a respectable career for women.

Early Life

Florence Nightingale was born in Florence, Italy, on May 12, 1820. She grew up in Great Britain, where she had a comfortable life with her wealthy par-

Florence Nightingale

ents. She studied several languages, history, and mathematics with her father at home.

Nightingale began studying nursing in 1850. At that time nursing was not a respected profession. Nevertheless, Nightingale felt called to be a nurse.

Career

In 1854 the Crimean War broke out between the Russians and the Turks, the French, and the British. Nightingale traveled to Turkey to care for the sick and wounded British soldiers. She found horrid conditions in the military hospital in Turkey. Medical supplies were low. The hospital was dirty and filled with rats and fleas. In fact, more patients were dying from fever and infection than from battle wounds.

Nightingale took control and was soon running the hospital. Her nursing duties often kept her up all night. The soldiers named her the Lady with the Lamp. At one point she nearly died from a fever. After the war the British people thought of Nightingale as a heroine.

In 1857 Nightingale became sickly. She spent most of the rest of her life at home, but she continued to work. In 1860 she formed the Nightingale School for Nurses. It was the first school in the world that trained women to be professional nurses. Nightingale died in London on August 13, 1910.

Nightshade

Some kinds of nightshade have poisonous leaves and berries.

Nightshade grows as a weedlike plant, a shrub, or a vine. Many of the more than 2,300 species, or kinds, of nightshade are poisonous. Two of the best-known kinds are common nightshade and bittersweet nightshade. Nightshades belong to a group of plants called the nightshade family, which also includes tomatoes and potatoes.

Nightshade plants grow naturally in woody, damp areas of North America, Europe, and Asia. Farmers grow deadly nightshade, also called belladonna, in Europe, India, and the United States. It is used in medicine.

Nightshades can grow from about 12 inches (30 centimeters) to 5 feet (1.5 meters) tall. Vines can reach up to 10 feet (3 meters) in length. The leaves in all species grow in pairs on opposite

sides of the stem. Flower colors can be white, blue, or deep purple. When the flowers die, berries appear. Depending on the species, the berries are yellow, red, or black.

Deadly nightshade contains substances called alkaloids, which have several medical uses. Eye doctors use an alkaloid to help them view the inside of the eye. Alkaloids also can be used to make sleeping pills and pain medications.

Nile River

The Nile is the longest river in the world. It flows through northeastern Africa for about 4,132 miles (6,650 kilometers). The great civilization of ancient Egypt developed on its banks.

Sailing ships called feluccas travel on the Nile River near Luxor, Egypt.

The most distant sources of the Nile are rivers that begin in Burundi and Rwanda. Those rivers flow into Lake Victoria. From Lake Victoria the Nile flows through Uganda and Sudan. For about 500 miles (800 kilometers) in Sudan the river is called the White Nile.

At the city of Khartoum, Sudan, the White Nile is joined by the Blue Nile. Farther north it is joined by the Atbara River. Both the Blue Nile and the Atbara begin in the highlands of Ethiopia. The Nile continues to flow north across the deserts of Sudan and Egypt. North of Cairo, Egypt, the Nile enters the region called the delta. There it splits into two branches that flow into the Mediterranean Sea.

Plants and Animals

Tropical rain forests grow along the southern Nile. They include banana, ebony, rubber, and bamboo trees. Savanna grasslands run along the Blue Nile. The desert north of Khartoum has few plants.

Fish found in the Nile include Nile perch, catfish, eels, lungfish, mudfish,

and tiger fish. Nile perch can grow to 300 pounds (140 kilograms). Nile crocodiles, soft-shelled turtles, and snakes are common reptiles.

Economy

Ancient Egyptians who lived along the Nile were among the first people to take up farming. They used the river to water their crops through methods called irrigation. Crops now grown along the Nile include beans, corn, cotton, millet, rice, wheat, and sugarcane.

Today dams hold back Nile floodwaters for irrigation. They also produce electricity. The most important dam is the Aswan High Dam in Egypt. The Nile is also a main waterway for moving people and goods.

Nipmuc

The Nipmuc were a group of related Native American peoples of New

England. They traditionally lived on the land that is now Massachusetts, Rhode Island, and Connecticut. They lived mostly along rivers or near lakes. The name Nipmuc means “freshwater fishing place.”

The Nipmuc built homes by covering pole frames with bark or woven mats. They grew corn, beans, and squash. They hunted moose, deer, black bears, rabbits, and squirrels. The Nipmuc also fished and gathered wild roots, berries, and nuts.

In the 1630s English colonists began to settle in Nipmuc territory. By 1674 some Nipmuc had moved to villages set up by the English. However, most of the Nipmuc wanted to drive the English from their lands. In 1675 they joined a Native American force in a war against the colonists. The leader of the Native Americans was the Wampanoag chief Metacom, who was also known as King Philip. King Philip’s War was the bloodiest conflict in New England in the 1600s. The Native Americans lost the war.

Some of the surviving Nipmuc fled their lands. Some joined the Mohican and other tribes living along the Hudson River. Others fled to Canada. At the end of the 20th century there were about 600 Nipmuc. They lived in Massachusetts and Connecticut.

Did You Know?

The Nipmuc and nearby tribes had chiefs called sachems.

A museum display in Connecticut shows what a Nipmuc village looked like.

Nixon, Richard M.

Richard M. Nixon was the 37th president of the United States.

Richard M. Nixon was the 37th president of the United States. He was the first president to resign from office. He was forced to step down in 1974 because of his involvement in the political scandal known as Watergate.

Early Life

Richard Milhous Nixon was born on January 9, 1913, in Yorba Linda, California. His father, Frank Nixon, was a service station owner and grocer. His mother, Hannah Milhous, was a Quaker. Nixon won a scholarship to Duke University Law School in Durham, North Carolina. After graduating in 1937, he returned to California to practice law.

Nixon married Thelma Catherine Patricia Ryan, known as Pat, in 1940. They had two children. Nixon joined the U.S. Navy in 1942 and served in World War II.

Political Career

After the war Nixon was elected to the U.S. House of Representatives as a Republican. In 1950 Nixon won a seat in the U.S. Senate. Two years later the Republicans chose him to run for vice president under Dwight D. Eisenhower. Eisenhower and Nixon won the elections of 1952 and 1956.

In 1960 Nixon ran for president but lost the election to John F. Kennedy. Two years later he ran for governor of California. Again he lost.

Presidency

In 1968 the Republicans again chose Nixon to run for the presidency. Nixon narrowly defeated the Democratic candidate, Hubert H. Humphrey.

President Nixon turned his attention to foreign affairs, especially the Vietnam War. In 1969 Nixon began to take U.S. troops out of Vietnam. However, he also bombed North Vietnam and expanded the war into neighboring Cambodia and Laos.

In 1972 Nixon visited China. It was an important trip because the governments of the United States and China had not met for 21 years. Later that year he visited the Soviet Union and signed a number of treaties that limited nuclear weapons.

TIMELINE

Nixon is born in Yorba Linda, California.

January 9, 1913

Nixon becomes vice president under Dwight D. Eisenhower.

1953

The Senate starts investigating Watergate.

1973

Nixon dies in New York City.

April 22, 1994

Nixon wins a seat in Congress.

1946

Nixon is elected president.

1968

Nixon resigns.

1974

Nixon easily won reelection in 1972. In January 1973 the United States and North Vietnam agreed to stop fighting. However, the political scandal called Watergate soon overshadowed that success.

Watergate

In 1972 Republicans hired five men to spy on the Democrats. That June police arrested the men for breaking into the Democratic national headquarters, located in the Watergate building in Washington, D.C. After the arrests Nixon secretly ordered his staff to cover up the Republicans' role in the crime.

In 1973 the Senate began investigating the Watergate affair. In 1974 documents proved that Nixon had ordered the cover-up. The House of Representatives planned to impeach Nixon, or charge him with crimes. Before he could be impeached, Nixon resigned on August 8, 1974.

Vice President Gerald R. Ford replaced Nixon as president. Ford pardoned Nixon for any crimes he might have committed during his presidency.

Retirement

Nixon retired to California. He wrote several books. Nixon died in New York City on April 22, 1994.

Nobel Prize

The Nobel prize is one of the most important awards that anyone can receive. Nobel prizes are given each year in six subject areas. The areas are physics, chemistry, medicine, literature, peace, and economics. The prizes honor people anywhere in the world who have done outstanding work in one of these areas.

Wangari Maathai of Kenya was awarded the Nobel peace prize in 2004. She was the first black African woman to receive a Nobel prize.

The Nobel prizes are named after Alfred Nobel, a Swedish scientist. He invented the explosive called dynamite. The invention made him rich. He decided to use the money to honor people who helped humankind in some way.

The first Nobel prizes were handed out on December 10, 1901, exactly five years after Alfred Nobel's death. At first there were only five prizes. The prize for economics was added to the list in 1969. Groups in Sweden decide who wins most prizes. A group in Norway picks the winner of the peace prize.

The winners receive their awards at a banquet in Stockholm, Sweden. Each winner takes home a gold medal and a certain amount of money. Sometimes two or three people share a prize. Only the peace prize can be won by an organization, however.

Nomad

A nomad is a person who moves from place to place. Long ago, before the development of farming and cities, many people were nomads. They moved from one area to another in search of food for themselves or for their animals. The number of nomads has decreased over the years. However, some people still have a nomadic lifestyle.

There are three general types of nomads: hunters and gatherers, pastoral nomads (animal herders), and craftsmen-handymen-traders. Hunter and gatherer nomads move around in search of animals to hunt and wild plant foods to gather. Many Native Americans were hunter and gatherer nomads before Europeans arrived in their lands. Today some of the San (Bushmen) of southern Africa are hunters and gatherers.

Pastoral nomads travel to find land where their animals can graze. Some peoples of central Asia, Siberia, the Arabian Peninsula, and northern Africa are pastoral nomads. The Kazakh people of central Asia herd horses, sheep, cattle,

Nomads collect water from a well in Somalia.

goats, and camels. Some Kazakhs travel hundreds of miles from winter homes in the south to summer pastures in the north. They live in tents called yurts. The Bedouins are pastoral nomads of the Arabian Peninsula.

Craftsmen-handymen-trader nomads travel around selling goods or providing services. For example, nomads in India and Pakistan go from town to town selling handmade baskets and other goods. The Roma (Gypsies) are other nomads of this type. Today, though, many Roma live settled lives.

Nootka

The Native Americans known as the Nootka live on the west coast of Van-

A photograph from about 1910 shows a Nootka holding a spear.

couver Island. The island is part of British Columbia, a province of Canada. In the past some Nootka lived in the northwestern part of the U.S. state of Washington. The Nootka call themselves Nuu-chah-nulth, which means “all along the mountains.” The name refers to the mountains of Vancouver Island.

The Nootka traditionally got much of their food from the sea. They hunted whales, seals, and sea otters. They also fished and collected wild roots and berries. During the warmer months the Nootka got enough food to last all year. In winter they moved to camps away from the sea, where they ate dried fish.

The Nootka held feasts called potlatches. The family hosting a potlatch gave gifts to their guests. The gift giving increased their status within the tribe.

European explorers and traders visited Nootka lands beginning in 1774. The Nootka generally welcomed the visitors. They gave the Europeans furs in exchange for goods such as metal pots and tools. However, the traders also brought diseases that killed many Nootka.

As the Nootka population decreased, white settlers took control of their land. In 1871 the Canadian government set aside a small piece of land for the Nootka. In the early 21st century there were about 6,000 Nootka in Canada.

Nootka religious leaders held ceremonies to lure dying whales to their shores.

Norman Conquest

A page from a book from the 1300s shows William the Conqueror on horseback.

The Norman Conquest was an important event in English history. It happened in 1066, when the ruler of Normandy—an area in northern France—conquered England. This ruler is now known as William the Conqueror. No enemy since has invaded England successfully. The Conquest led to many changes in England.

Background

William became the duke, or ruler, of Normandy in 1035. He was the cousin of the king of England, Edward the Confessor. Edward's people were the Anglo-Saxons. When Edward died in January 1066, William thought he should become king. However, an Anglo-Saxon named Harold crowned himself king.

Conquest

William decided to fight Harold for the crown. He gathered about 5,000 knights on the coast of Normandy, directly across the English Channel from England. His army landed in England on September 28.

The Norman and Anglo-Saxon armies battled near the town of Hastings on October 14. Harold's men were no match for William's knights on horseback. An arrow killed Harold, and the remaining Anglo-Saxon forces scattered and fled.

William then advanced to London, the capital. He was crowned king on Christmas Day in 1066. Some parts of the country resisted him until 1071.

How England Changed

William rewarded many of his knights by making them England's new nobles. They built castles and gave land to their own followers. They replaced the Anglo-Saxons who had controlled the land. However, William did not overturn the English system of laws and courts.

The Conquest also changed the English language. People used mainly Latin and Norman French for writing for about 200 years afterward. In the 1200s English came back as a written language. By then it had many new words that were borrowed from Latin and French.

North America

Canada, the United States, and Mexico make up the largest part of the continent of North America. The countries of Central America also are part of the continent, and several islands, including the West Indies and Greenland, are associated with North America. It is third in size and fourth in population among Earth's continents.

Land and Climate

Belts of mountains run along the east and west sides of North America. In the east are the Laurentians and the Appalachians. The mountains in the west are much taller. They include the Rocky Mountains, which extend from Canada to Mexico. Mexico has the Sierra Madre Occidental in the west and the Sierra Madre Oriental in the east.

Forests of both evergreens and hardwood trees cover the slopes of the Adirondack Mountains, in the U.S. state of New York.

Between the Appalachians and the Atlantic Ocean in the east is a low coastal plain. Another vast lowland stretches from the Rocky Mountains to the Appalachians. Between Mexico's eastern and western mountain systems lies a high central plateau.

The Great Lakes, in east-central North America, make up the largest area of freshwater in the world. Most of the continent's other large lakes are farther north, in Canada. North America's largest river system is the Mississippi. On its way to the Gulf of Mexico, the Mississippi picks up the waters of the Missouri and the Ohio. Together these rivers drain the central United States.

Most of North America has a mild climate, with warm summers, cold winters, and moderate rainfall. However, much of Alaska and northern Canada have bitterly cold winters and short, cool

The Rio Grande flows through the desert in Big Bend National Park, in the U.S. state of Texas. The river forms the border between Texas and Mexico. In Mexico it is known as the Río Bravo del Norte.

summers. Parts of the southwestern United States and northwestern Mexico are very dry, with regions of desert and semidesert. Central America has hot weather and heavy rainfall throughout the year.

Plants and Animals

The mountainous parts of North America contain large areas of thick forests. Douglas fir, redwood, pine, and spruce trees grow along the northern Pacific Coast. Tropical hardwood forests grow in Mexico and Central America. Few plants grow in the desert and cold northern regions. Prairies form a belt between forest and desert, mainly on the Great Plains of the central part of the continent.

Animals native to North America include bighorn sheep, mountain goats, moose, and elk. There are also mountain lions (pumas), bobcats, lynx, coyotes, wolves, and bears. Deer thrive in many areas, while squirrels, rabbits, and raccoons have adapted to areas inhabited by humans. Alligators, snakes, wild pigs, colorful birds, and monkeys live in the warmer southern regions.

Human activity has greatly affected the plants and animals. By the mid-1900s the United States had killed much of its wildlife, cut more than half its timber, and plowed up nearly all its grassland. Much of this was done to clear the land for cities to develop. In the second half of the 1900s the countries of North America began to protect some of their land and animals.

People

The original inhabitants of North America were Native Americans. In Mexico and parts of Central America, more than 80 percent of the people have at least some American Indian ancestors. Most of the people in the United States and Canada are of European descent. In the United States an important minority of the people have ancestors from Africa who were brought over as slaves.

In the United States and most of Canada the main language is English. French is spoken in parts of eastern Canada, particularly Quebec. Spanish is the main language in Mexico and Central America and is also spoken by many people in the United States.

Most of the continent's people are Christian. Canada has more Roman Catholics than Protestants, and nearly all Mexicans are Roman Catholic. In the United States all major religions are rep-

Skyscrapers in Toronto line the shores of Lake Ontario, one of the five Great Lakes. Toronto is the capital of the province of Ontario, Canada. It is also Canada's largest metropolitan area.

resented, though more than half the people follow Protestant faiths. The United States and Canada have Jewish and Muslim minorities.

Overall, the people in Canada and the United States enjoy a good quality of life. Nearly everyone there can read and write. Hospital facilities are second to none. However, there is also some poverty. A wide gap exists between those who are well off and those who have less. In Mexico and Central America poverty is more common. Fewer people are wealthy, and health and educational facilities are less available.

Economy

In the United States and Canada the economy has long depended more on manufacturing than on farming. Manufacturing began to grow quickly in Mexico as well in the late 1900s. Chemicals, food products, electronics, transportation equipment, and other machinery are North America's leading products. Industries that serve the public, such as banking, health care, communications, and tourism, became the most significant part of the continent's economy in the late 1900s. In Central America farming is most important.

North America produces much of the world's food. Wheat, corn, soybeans, hay, fruits and vegetables, and dairy products are produced in various regions of the United States and Canada. In Mexico sugarcane, corn, sorghum, bananas, and other tropical fruits and vegetables are grown.

Piles of harvested corn are set out to dry in the fields of a farming region in central Mexico. In the distance is the snowcapped peak of the volcano Iztaccíhuatl.

North America is also rich in natural resources, including minerals such as iron ore, copper, nickel, zinc, lead, and silver. The United States has large deposits of coal. Oil is found in the south-central United States and Alaska, western Canada, and eastern Mexico.

History

North America's first human inhabitants came over from Asia some 20,000 to 35,000 years ago. The people who became the Native Americans came first and eventually moved south. The Inuit came later and remained in the north.

As early as 3500 BC, settlers began establishing farming. The Olmec in what is now Mexico were the first to build a civilization, beginning in about 1200 BC. They built trading villages and developed a system of writing. The

Maya and Aztec later built other cities, pyramids, and monuments.

A Viking named Leif Eriksson was probably the first European to visit North America. He landed in what is now Canada in about AD 1000. However, the Vikings did not make any permanent settlements. In the late 1400s Europeans began exploring the continent, and they soon established colonies. In general, Spain took control of the southern area (present-day Mexico and Central America), France settled in the north

(present-day Canada), and England took the middle (present-day United States). The English took over much of the north in the 1760s.

The United States was formed in 1776, when the 13 British colonies declared their independence. Mexico became independent from Spain in 1821. Canada formed a separate government within the British Empire in 1867 and became officially self-governing in 1931. Gradually, nearly all the colonies of Central America and the West Indies also gained independence.

The United States and Canada developed rapidly in the last half of the 1800s. But this came at a heavy cost to Native Americans. Most of the peoples who had survived fighting and diseases brought by Europeans lost their homelands. They were left only with confined areas called reservations in the United States and reserves in Canada.

Mexico remained more in touch with its Amerindian heritage, but it was less developed economically. The United States attracted many emigrants from Mexico. In 1992 Canada, the United States, and Mexico signed the North American Free Trade Agreement. The agreement was meant to promote trade between the three countries.

North Atlantic Treaty Organization

The members of the North Atlantic Treaty Organization (NATO) are countries in Europe and North America. All have made a promise to help defend each other if any of them is attacked. NATO was founded in 1949 because of threats from the Soviet Union. Now it deals with other issues. Its headquarters are in Brussels, Belgium.

Formation

After World War II (1939–45) the Communist government of the Soviet Union set up other Communist governments in several countries of eastern Europe. The countries of western Europe had democratic governments. They feared that the Soviets would spread Communism even farther. The

NATO does other things besides defending its member countries. The organization sent soldiers and supplies to Pakistan after an earthquake in 2005.

United States and other democratic countries shared their concern. This tension between the Soviet Union and its democratic rivals became known as the Cold War.

To protect each other against the Soviets, 12 countries formed NATO in 1949. The original NATO members were Belgium, Canada, Denmark, France, Iceland, Italy, Luxembourg, The Netherlands, Norway, Portugal, the United Kingdom, and the United States. More countries joined later.

In 1955 the Soviet Union and its Communist allies formed a group similar to NATO. It was called the Warsaw Pact.

After the Cold War

In the early 1990s the Soviet Union broke up and the Warsaw Pact ended. The Cold War was over. Hungary, Poland, and the Czech Republic—all former members of the Warsaw Pact—joined NATO in 1999. Seven more countries that had been Communist joined NATO in 2004.

In 1995 NATO first used military force. Its warplanes bombed Serbian troops in the Balkans region of southeastern Europe. These troops were threatening other ethnic groups. In September 2001 terrorists attacked the United States. This marked the first time that NATO was called upon to defend one of its members. It supported U.S. efforts to end terrorism.

North Carolina

Misty clouds pass over the Great Smoky Mountains in North Carolina.

One of the original 13 states of the United States, North Carolina is rich with history. In 1587 it was the birthplace of Virginia Dare, the first child born of English parents in America. Almost 200 years later, in 1775, the colony of North Carolina became the first to approve a vote for independence from Great Britain. The state also was the site of the first successful airplane flight, by the Wright brothers in 1903. The state capital is Raleigh.

Geography

North Carolina is located in the southeastern part of the United States. It is bordered by the Atlantic Ocean on the east, Virginia on the north, Tennessee on the west, and Georgia and South Carolina on the south.

Along the Tennessee border are the Appalachian Mountains. The major Appalachian ranges in North Carolina are the Great Smokies and the Blue Ridge. The central part of the state is an area with rolling, forested hills. North Carolina's largest natural region is the coastal plain in the east. Off the coast is a long chain of islands and sandy reefs known as the Outer Banks. North Carolina has a pleasant climate, with warm summers and mild winters.

People

The early European settlers in North Carolina represented a variety of nationalities, including English, Scottish, Irish, and German. Their descendants make up nearly three fourths of the state's people. African Americans account for more than a fifth of the population. The state's 100,000 Native Americans represent one of the largest Indian populations in the country.

Economy

North Carolina is among the nation's leading industrial states. The state's

long-established manufacturing industries include textiles, wooden furniture, and cigarettes. Among its newer industries are computers, electronic equipment, and chemicals. Other major industries include banking, real estate, and tourism. The main agricultural products include hogs, broiler chickens, greenhouse plants, and tobacco.

History

Native Americans have lived in what is now North Carolina for more than 15,000 years. The Cherokee were the largest group of Native Americans in the area when European settlers arrived.

In 1585 the English set up their first colony in North America on Roanoke Island, off the coast of North Carolina. The colony was not successful. More colonists landed on the island in 1587, but they disappeared by 1591. The only trace they left behind was the word Croatoan carved on a tree. The word may have referred to local Native Americans.

Virginians established the first permanent settlement in the mid-1600s. In 1663 the English king granted the Carolina region to eight Englishmen. North Carolina became a royal colony in 1729.

With the outbreak of the American Revolution (1775–83), loyalties in North Carolina were divided. The British government was overthrown in 1775, however, and an independent state government was established. North Carolina joined the Union in 1789 as the 12th state.

Sand dunes meet the Atlantic Ocean at Cape Hatteras National Seashore on Hatteras Island, North Carolina.

After 1835 North Carolina entered a period of great economic growth. The state's agricultural economy, however, depended on slave labor. Despite the role of slavery in North Carolina, the state was not quick to join other Southern states in the Confederacy before the American Civil War (1861–65). Once the war began in 1861, North Carolina withdrew from the Union and fought with the Confederacy.

After World War I (1914–18) manufacturing overtook agriculture as the most important part of North Carolina's economy. North Carolina changed rapidly after World War II (1939–45). Many people moved from the countryside to the cities, and new industries were established. The pleasant weather and scenery led many people to North Carolina to retire. The state's population grew at a record pace of almost 40 percent between 1990 and 2008.

North Dakota

The state of North Dakota lies on the Great Plains in the north-central United States. North of North Dakota is the country of Canada. North Dakota's nickname, the Peace Garden State, is a symbol of the friendship between the United States and Canada. Likewise, "Dakota" is an Indian word that means "friends." The capital of North Dakota is Bismarck.

Geography

North Dakota is bordered on the west by Montana, on the south by South Dakota, and on the north by the Canadian provinces of Manitoba and Saskatchewan. To the east, the Red River of the North separates North Dakota from Minnesota.

The western part of the state has a rolling surface that is dotted with buttes—flat-topped hills that rise above the surrounding plains. The Missouri is the state's major river in the west. A rugged region called the Badlands is located in the southwest. Most of North Dakota's farms are on smoother land in the eastern part of the state. North Dakota has a dry climate with hot summers and cold winters.

People

North Dakota is a largely rural state. More people live in farming areas than in cities. About 90 percent of North Dakotans are whites of European heritage. The earliest white settlers included many Norwegians, Canadians, and Ger-

mans. Before whites arrived there were various tribes of Plains Indians, including the Mandan, Sioux, and Ojibwa (Chippewa). Today Native Americans are the largest minority group in the state. They make up about 5 percent of the population.

Economy

North Dakota has traditionally been a farm state. The state is among the nation's leading producers of wheat. Other crops grown in North Dakota include barley, rye, oats, flax, sunflowers, soybeans, sugar beets, potatoes, and hay. Cattle are the most valuable livestock product.

North Dakota has been an important producer of petroleum (oil) since the 1950s. Manufacturing has been a growing part of the state's economy since the 1990s. Among other things, factories produce foodstuffs, machinery, and motor vehicle products.

History

Native American peoples lived in the region thousands of years before Europeans arrived. The first known European visitor was a French-Canadian explorer who arrived in 1738. Other colonists soon arrived from Canada to trap animals for their furs.

The region was acquired by the United States in 1803 as part of a land deal with France known as the Louisiana Purchase. Soon afterward the Lewis and Clark Expedition made its way through the area by way of the Missouri River. The first white settlement was established at Pembina in 1812.

Fur trappers were gradually replaced by wheat farmers and ranchers. The Dakota Territory was organized in 1861 and later divided into northern and southern regions. The coming of the railroads in the 1870s and 1880s brought new set-

Bales of hay lie in a farm field in North Dakota.

Rugged hills and few plants are typical of the Badlands of Theodore Roosevelt National Park in southwestern North Dakota.

tlers. In 1889 North Dakota became the 39th state.

During the 1930s North Dakota's farming community was devastated by terrible weather. A great drought parched the land, and high winds blew much of the fertile soil away.

The state's economy recovered after World War II (1939–45). In the 1950s North Dakota began producing oil. In 1954 work was completed on the massive Garrison Dam on the Missouri River. The dam was built to produce electricity. It also created a large lake, Lake Sakakawea. During the 1960s the United States government built many air bases and missile sites in North Dakota. Many military sites in the state were closed, however, in the 1990s. In 1997 a damaging flood took place along the Red River of the North.

Northern Ireland

Northern Ireland is the smallest of the four parts of the United Kingdom, a country of western Europe. England, Scotland, and Wales are the other three parts. Northern Ireland is often called Ulster because it includes six of the nine counties that made up the ancient kingdom of Ulster. Its capital is Belfast.

Geography

Northern Ireland is in the northeastern corner of the island of Ireland. The country of Ireland takes up the rest of the island. The North Channel separates Northern Ireland from Scotland to the east. England and Wales lie across the Irish Sea, to the east and southeast.

Northern Ireland has rolling hills surrounded by low mountains. Near the middle of Northern Ireland is Lough Neagh, the largest lake in the United Kingdom. The northern coast is made up of thousands of rock columns. Northern Ireland has a cool, rainy climate with strong winds.

People

Northern Ireland has two main groups of people. About half of the people are descended from Scottish and English settlers who arrived in the 1600s. Most of these people are Protestant. About two fifths of the people are Irish. They are descended from the ancient Celts. These people are mainly Roman Catholic. Almost everyone speaks English.

Economy

Services such as health, education, government, and banking are very valuable to Northern Ireland's economy. Manufacturing and farming are important, too. Factories make automobiles, aircraft, textiles, clothing, and foods. Farmers raise pigs, cattle, sheep, and poultry. The major crops include barley, wheat, oats, and potatoes.

History

In about 300 BC the Celts invaded Ireland from Europe. They set up king-

The Giant's Causeway is a large rock formation on the northern seacoast of Northern Ireland.

doms, including Ulster in the north. England took control of Ireland in the 1100s. In the 1500s the English broke away from the Roman Catholic church and became Protestants. They tried to force the Irish to become Protestants as well. The Irish, who were mostly Roman Catholic, rebelled but were defeated. In the 1600s the English king sent Protestants from Scotland and England to settle in Ulster. The Protestants and the Roman Catholics fought one another.

In 1801 Ireland was officially joined to England, Scotland, and Wales to form the United Kingdom. The Irish people still did not accept British rule. In the early 1900s the Irish began to fight for independence. But the Protestants in the north wanted to stay in the United Kingdom. In 1920 the British government split the island into two parts. Northern Ireland was created out of the six mostly Protestant counties of the north. The other three northern counties joined the rest of Ireland, which became a separate country in 1921.

In the late 1960s fighting broke out between Catholics and Protestants in Northern Ireland. The British sent troops there to stop the violence. In response, a Catholic group called the Irish Republican Army (IRA) began to use terrorism against the British. The IRA wanted to force out the British and reunite Northern Ireland with Ireland. Thousands of people were killed or injured in the violence.

The IRA and the British government signed a peace agreement in 1998. In

1999 the British government gave Northern Ireland some power to govern itself. But some Protestants and Catholics found it hard to work together. When problems arose, the British government sometimes took their power away.

Northern Territory

The Northern Territory is a territory of Australia. A territory is an area that belongs to a country but does not have the same rights as a state. The Northern Territory is huge, but only about 1 percent of Australia's people live there. Darwin is the capital and largest city.

Geography

On the north the Northern Territory borders the Timor Sea (part of the Indian Ocean) and the Arafura Sea (part of the Pacific Ocean). Three Australian states surround the territory—

Did You Know?

Northern Ireland is still sometimes called Ulster, after the ancient Celtic kingdom of that name.

Australia's Northern Territory features a huge stone formation called Uluru/Ayers Rock.

Queensland on the east, South Australia on the south, and Western Australia on the west. The Northern Territory covers an area of 520,902 square miles (1,349,129 square kilometers).

The territory's major rivers include the Roper, the Daly, the Victoria, the Katherine, the Adelaide, the Mary, the South and East Alligator, and the McArthur. Mount Zeil, at 4,957 feet (1,511 meters), is the highest point in the territory. Uluru/Ayers Rock is a huge, red stone formation that rises in the south. It is one of Australia's best-known symbols.

The northern part of the territory has a hot climate, with dry and wet seasons. The southern part is hot and dry.

People

About 200,000 people live in the Northern Territory. About half of them live in Darwin. The territory's other main city is Alice Springs. The rest of the Northern Territory has few or no people.

Most of the people of the Northern Territory have European roots. Aborigines (the original people of Australia) make up about one quarter of the population. The Aborigines live mostly in rural areas. Their culture and heritage have been well preserved.

Economy

Mining is the most important economic activity in the Northern Territory. The land contains bauxite (which is used to make aluminum), gold, manganese, zinc, lead, uranium, silver, oil, and natural gas. Tourism is another important industry. In addition, the territory has many huge cattle and sheep ranches, which are called stations.

History

Aborigines have lived in the Northern Territory for at least 40,000 years. Dutch traders visited the coast in the 1600s. Indonesian fishers came later.

An Aboriginal artist creates a painting in the town of Alice Springs, in the Northern Territory, Australia.

Did You Know?

Thousands of Chinese workers came to the Northern Territory during the gold boom of the 1870s. For a while the territory was mostly Chinese.

The British set up forts in the region beginning in 1824. In 1839 the British named a natural harbor on the coast Port Darwin, after the famous scientist Charles Darwin. The British founded the area's first lasting settlement at the harbor in 1869. They named it Palmerston.

In the 1870s the discovery of gold near Palmerston brought many settlers to the town. Telegraph and railroad lines soon connected it to the rest of Australia. Ranchers, farmers, and sheep herders settled there. At first the colony of South Australia controlled the Northern Territory. By 1911 the new Australian government had taken over the territory, and Palmerston was renamed Darwin.

The Northern Territory gained control over its own government in 1978. In 1998 the people voted not to become a state of Australia.

North Sea

The North Sea is a part of the Atlantic Ocean. It lies between Great Britain and the northwestern European mainland. It covers an area of about 220,000 square miles (570,000 square kilometers). People have long used it for shipping and fishing.

The countries that border the North Sea are Norway, Denmark, Germany, The Netherlands, Belgium, France, and the United Kingdom. Many European rivers, such as the Rhine, the Seine, and the Thames, flow into the North Sea. Along the northern shores of the North Sea, the coastline is rugged. Norway has many rocky islands and steep inlets called fjords. Along the southern shores of the North Sea, the coastline is less rugged. The coast of The Netherlands is low and marshy. The British coast has low cliffs and sandy beaches.

The North Sea is one of the most dangerous seas in the world. It has wild storms and foggy winters. Because the sea is mostly shallow, the currents are strong. They often pull in different directions.

Even though the North Sea can be dangerous, it is important to trade. There are many ports on the North Sea where ships arrive and leave with goods. Fishing in the North Sea is a key industry. Another important North Sea business is drilling for petroleum (oil) and natu-

People have built platforms in the North Sea in order to drill for oil beneath the seafloor. Natural gas, which may escape during the drilling, appears as flames shooting from the platform.

ral gas. These resources were discovered under the sea floor in the 1950s.

The North Sea helped Europe grow. After the Middle Ages (about AD 500 to 1500), Europeans traveled and traded mainly by ship. They landed in North Sea ports to trade goods and share ideas and inventions.

Northwest Passage

For centuries explorers tried to find a route from the Atlantic Ocean to the Pacific Ocean through the waters surrounding Canada's Arctic islands. They

called that route the Northwest Passage. They knew that finding the passage would increase trade for many nations. In 1906 the Norwegian explorer Roald Amundsen became the first person to complete the voyage by sea.

The Northwest Passage is located about 500 miles (800 kilometers) north of the Arctic Circle and less than 1,200 miles (1,900 kilometers) from the North Pole. The passage is made up of a series of channels through Canada's Arctic islands. It extends about 900 miles (1,450 kilometers) from east to west, from north of Baffin Island to the Beaufort Sea, north of Alaska.

Navigating the Northwest Passage can be dangerous, especially because of thousands of huge icebergs. Many

There is more than one route through the Northwest Passage. The Norwegian explorer Roald Amundsen went south of Victoria Island, but later explorers stayed north of it.

famous explorers, including John Cabot, Jacques Cartier, Sir Francis Drake, and Captain James Cook, tried unsuccessfully to find the passage. In 1845 Sir John Franklin and 128 men disappeared during their voyage. While searching for Franklin, Robert McClure sailed his ship

into the passage's western entrance. The ship then became frozen in the ice for two winters. McClure and his men finally gave up on the ship and traveled by land to meet another ship to the east. Thus they completed the first crossing of the Northwest Passage in 1854, though in more than one ship and partly on foot.

Roald Amundsen (left) and his crew members pose for a photograph aboard the ship on which they made the first successful trip through the Northwest Passage.

The Northwest Passage was not conquered entirely by sea until Amundsen's voyage. Amundsen and his crew sailed from east to west in a fishing boat. The trip lasted from 1903 to 1906.

A Canadian named Henry A. Larsen made the first west–east sea voyage in 1940–42. In 1944 Larsen sailed through the passage in one season.

Northwest Territories

A land of forests and tundra, the Northwest Territories covers a vast part of northern Canada. The capital is Yellowknife.

Geography

Only part of the Northwest Territories is on the North American mainland. The rest is made up of islands in the Arctic Ocean in the north. Nunavut is the eastern neighbor of the mainland part of the Territories. To the south are Saskatchewan, Alberta, and British Columbia. The Yukon Territory lies to the west.

The Mackenzie Mountains form a rocky wall along the western edge of the Territories. The plains east of the mountains are heavily forested. The Mackenzie River, the longest river in Canada, flows through the plains. It connects the Territories' two large lakes, Great Slave Lake and Great Bear Lake, to the Arctic Ocean. In the north and east the land is barren, icy tundra.

People

Native peoples make up about half of the population of the Northwest Territories. Most are American Indians who speak Athapaskan languages. They call themselves Dene. The other native group is the Eskimo (Inuit). There are also several thousand Métis—people of mixed American Indian and European heritage. Most of the rest of the people are of European descent.

For such a large area, the Territories has a very small population. Vast parts of the Territories have no people at all. Nearly all the people live in small settlements near the Mackenzie River. Yellowknife, on the northern shore of Great Slave Lake, is the only real city. Most of the Eskimo live along the Arctic coastlines of the mainland and the northern islands.

Economy

Diamond mining is the Territories' leading industry. Mines also provide some gold, silver, zinc, and lead. The production of oil and natural gas is another valuable industry.

In the winter cars and trucks in parts of the Northwest Territories travel on ice roads, or roads made of ice and snow. Ice roads run across frozen lakes and land to connect the city of Yellowknife to the town of Dettah and to several distant diamond mines.

**When
Northwest
Territories
Became a
Territory**
1870

Many residents of the Northwest Territories work in government, and tourist services are growing. Still, many of the people make a living through fishing, hunting, and trapping. Muskrats, beavers, martens, mink, lynx, and foxes provide valuable furs. Many people also make money by selling arts and crafts.

History

Dene and Eskimo peoples arrived in what is now the Northwest Territories thousands of years ago. The English sailor Martin Frobisher explored the coast in 1576 while looking for a sea route to Asia. In 1789 the Scottish explorer and fur trader Alexander MacKenzie traveled to the Arctic Ocean along the river that is now named for him.

The first settlements in the area served mostly fur traders. For 200 years,

beginning in the late 1600s, a British fur-trading corporation called the Hudson's Bay Company controlled much of the land. The region was called Rupert's Land. The rest of the land, the North-Western Territory, was under British rule. In 1870 all of the land was given to the new country of Canada. The combined area was called the Northwest Territories. In 1880 Great Britain's Arctic islands were added to the Territories.

Fur traders, missionaries, and police controlled the life of the Northwest Territories until the 1920s. Then oil was discovered near Fort Norman on the Mackenzie River. The discovery led Canada to create a government for the territory. In 1999 the size of the Territories was reduced by more than half when the territory of Nunavut was created as a homeland for the Eskimo.

Norway

The Kingdom of Norway is farther north than most other countries in Europe. In early times the Vikings controlled Norway. Modern Norway is a prosperous, independent country. The capital is Oslo.

Geography

Norway is part of the northern European region known as Scandinavia. It shares borders with Sweden, Finland, and Russia. The Arctic Ocean lies to the north, and the Atlantic Ocean is to the west. The North Sea lies to the south. Norway controls the Svalbard Islands to the north as well as many small islands off the west coast.

About two thirds of Norway is mountainous. Norway's highest peak, Galdhøpiggen, rises 8,100 feet (2,469 meters) above sea level. The south is mainly flat. Long, narrow arms of the sea—called fjords—stretch inland on the western coast. The country also contains more than 1,500 glaciers, or huge blocks of slowly moving ice.

The western coast has cool summers and mild winters. The east has warmer summers and colder winters. North of the Arctic Circle the sun does not set for most of the summer. However, in part of the winter the sun never rises.

Plants and Animals

Forests cover about a quarter of the country. The main trees include pine,

spruce, birch, and ash. Leafy mosses and heathers grow on the floor of many forests.

Small mammals such as hares, foxes, and badgers are common. Elk, reindeer, lemmings, and wolves live in the forests and mountains. Numerous trout, salmon, and other fish swim in Norway's waters.

People

Most Norwegians are Nordic, a European people with German roots. There are small groups of Asians and other Europeans. Several thousand Sami, or Lapps, live mainly in the north. The Sami are known for herding reindeer. They were once nomads, or wanderers, but they now live in permanent homes. Norwegian is the main language of the country. The Evangelical Lutheran branch of Christianity is the national religion. Most people live in cities, mainly in the southeast.

Lights surrounding the harbor at Bergen twinkle in the twilight. Bergen is a busy port and one of Norway's largest cities.

Economy

Norway is one of the world's largest suppliers of oil. The country also has rich deposits of natural gas and minerals. Norway's industries make food products, ships, machinery, metals, paper products, and other goods. Fishing and logging are important to the economy.

Most workers work in services, including communications, banking, and health care. Farming is only a small part of the economy. Farmers produce mainly grains, dairy products, and meat.

History

The Sami arrived in what is now Norway at least 10,000 years ago. Vikings from Norway raided and traded along Europe's coasts during the AD 800s–1000s. King Olaf II Haraldsson united all of Norway in the 1000s.

In the late 1300s Norway, Sweden, and Denmark came under the rule of one king. Norway was the weakest country in the union. Sweden gained indepen-

dence in 1523, but Denmark continued to control Norway. In 1814 Denmark lost control of Norway to Sweden. In 1905 Norway declared its independence.

Nazi Germany invaded Norway in 1940, during World War II. The Nazis set up a pro-German government in Norway. The Germans left in 1945, at the end of the war.

In 1949 Norway joined the North Atlantic Treaty Organization (NATO), a group of nations that promised to protect each other. However, Norway did not join the European Union.

Nose

The nose is an important organ, or body part, for breathing and smelling. In humans, the nose is located in the middle of the face, above the mouth. The two openings in the nose are called nostrils. Many other animals also have a nose. Some have only nasal openings.

The Human Nose

When a person breathes, air enters the nostrils, travels through the throat, and goes down into the lungs. A wall of tough, bendable tissue called cartilage separates the nostrils into two tubes, or nasal passages. A liquid called mucus lines the nasal passages. It helps to moisten the air. It also traps dirt and

bacteria carried in the air. Hairs in the nasal passages help to clean the air, too.

When air enters the nasal passages, it brings different scents with it. Tiny nerve endings in the lining of the nasal passages pick up these scents. They carry information about the scents to the brain.

Blockages or irritation in the nasal passages can make breathing and smelling difficult. Colds, allergies, infections, and pollutants in the air are some of the things that can cause these problems. Injuries to the nose also can cause breathing problems.

How Other Animals Smell

Many mammals, including dogs, have a very strong sense of smell. They use their nose to smell food, mates, and territories. However, some mammals do not have a nose or a good sense of smell. A whale, for example, has a blowhole, or nostril, on the top of its head for breathing. Some types of whale can smell through the blowhole, but others cannot.

A pig's nose is called a snout.

An elephant's trunk is a kind of nose. It helps the elephant breathe and smell things. But it is also used like a hand to pick up things.

Birds, reptiles, amphibians, and fish have nasal openings that allow them to smell. In fish and some amphibians, water passes through these openings instead of air. Some reptiles, including snakes, have an extra smelling organ on the roof of the mouth. A snake sticks out its tongue to collect scents. Then it rubs its tongue against the roof of its mouth to smell them.

Nouakchott

Population
(2005 estimate)
743,500

Nouakchott is the capital of Mauritania, a country in northwestern Africa. The city lies near the coast of the Atlantic

Ocean. Most of Nouakchott was built in the 1960s, which makes it quite new for a city. It grew quickly into Mauritania's largest city.

Nouakchott features mosques and a bustling market. It is a center of government and some business and industry. Copper and other products are shipped out from a port just outside the city. Oil was discovered near Nouakchott in the early 21st century.

During much of the 1800s and 1900s France ruled Mauritania. During that period Mauritania had no capital of its own. In the 1950s Mauritania began preparing to become independent from France. Nouakchott was chosen to be the new capital in 1957. At the time only about 400 people lived there.

In 1960 Mauritania became an independent country with Nouakchott as its capital. The city then grew greatly.

Nova Scotia

Along with New Brunswick and Prince Edward Island, Nova Scotia is one of Canada's Maritime Provinces. No part of Nova Scotia is more than 35 miles (56 kilometers) from the sea, which is key to life in the province. The capital is Halifax.

Geography

The province includes the peninsula of Nova Scotia, Cape Breton Island, and a few smaller islands. A narrow strait separates the peninsula from Cape Breton Island. The peninsula is connected to New Brunswick by a strip of land that is only 17 miles (27 kilometers) wide. Otherwise, Nova Scotia is surrounded by the sea. The Atlantic Ocean is to the east, the Gulf of Saint Lawrence is to the north, and the Bay of Fundy is to the southwest.

Nova Scotia lies within the Appalachian Mountains. Its landscape is mostly low mountain ranges separated by lowlands. The valley of the Annapolis River is called the garden of Nova Scotia because

the soil is good for farming. The lowlands along the Bay of Fundy are marshy because of the bay's very high tides. The Atlantic coastline is rocky, with many bays and coves.

People

More than half of Nova Scotia's people have Scottish, English, or Irish ancestors. French Canadians are the next largest group. They are descended from the original settlers of the territory. Most of the rest of the people have roots in other European countries, though there are small American Indian, Asian, and black minorities.

Most Nova Scotians live near the coast. About 40 percent of them live in Halifax, the largest city in the Maritime Provinces. Located on the southeast coast, Halifax has one of the world's largest natural harbors. Cape Breton, on Cape Breton Island, is the second largest city in Nova Scotia.

Economy

Like the rest of Canada, Nova Scotia now has a service-based economy. Most Nova Scotians work in service industries such as sales, banking, tourism, transportation, and shipping. The port of Halifax is one of Canada's busiest.

However, Nova Scotia's economy still relies heavily on natural resources. The fishing industry produces valuable catches of swordfish, tuna, scallops, lobsters, cod, and herring. Not much of the

land is good for farming, but Nova Scotia is still known for its fruits and vegetables. Farmers also raise chickens and dairy cows. Manufacturing plants process fish and farm products and make wood and paper products. Minerals produced in Nova Scotia include coal, salt, and gypsum, which is used in construction.

History

Micmac Indians lived in what is now Nova Scotia when the explorer John Cabot arrived in 1497. He claimed the land for England. In 1605 the French explorers Samuel de Champlain and Pierre de Monts arrived. They started Port Royal, the first colony in what is now Canada, on the Bay of Fundy. They called the land Acadia. In 1621, however, English and Scottish colonists renamed the land Nova Scotia, which means “New Scotland” in Latin.

1867

A group of young children wearing traditional Scottish clothing perform at a festival in Antigonish, Nova Scotia.

Cape Breton Highlands National Park is a popular recreational area with scenic hills and forests. It lies in the northern part of Cape Breton Island, in Nova Scotia, Canada.

The French and the British fought over the land for many years. In 1713 a treaty gave the peninsula to the British. In 1755 the British forced most of the French settlers to leave. Great Britain took over Cape Breton Island in 1763 and later made it part of Nova Scotia. Britain also ruled Prince Edward Island and New Brunswick as parts of Nova Scotia. They split off in 1769 and 1784, respectively. During and after the American Revolution (1775–83), many American colonists loyal to Britain moved to Nova Scotia.

In 1867 Nova Scotia became a part of the new country of Canada. During World War I (1914–18) and World War II (1939–45) Halifax played a key role in shipping troops and supplies to Europe. In later years Nova Scotia prospered with the rise of tourism.

Nubia

Nubia was an ancient region of north-eastern Africa. Its northern neighbor was ancient Egypt. Egypt ruled Nubia for thousands of years. Beginning in the 700s BC, however, the Nubian kingdom of Kush (or Cush) ruled Egypt for a short time. Nubia is now in the countries of Egypt and Sudan.

Ancient Nubia bordered the Red Sea on the east and the Libyan Desert on the west. It stretched south to what is now Khartoum, Sudan. The region had little rainfall, but farmers grew crops with water from the Nile River. The land was rich in gold and precious stones. The people of Nubia were black Africans.

Just after 3000 BC Egypt took over Nubia. Sometime after about 2181 BC newcomers entered Nubia from Libya in the west. They settled along the Nile as cattle herders. These immigrants devel-

oped their own civilization with unique crafts and architecture.

Egypt eventually took back control of Nubia. In the 1400s BC the pharaoh (Egyptian king) Thutmose I divided Nubia into two parts. The north became Wawat. The south became Kush.

In about 1000 BC Kush started growing stronger. By about 715 BC the people of Kush, called Kushites, had conquered all of Egypt. Soon, however, the Assyrians from Asia drove the Kushites from Egypt. The Kushites went back to Nubia, where they ruled for almost 1,000 years. In about AD 350 the kingdom of Aksum took over Kush.

By the late AD 500s, there were three Christian kingdoms in Nubia: Nobatia, Makuria, and Alodia (also known as Alwa). Muslim Arabs conquered Egypt in the AD 600s. But they did not conquer the Nubian kingdoms for hundreds of years. Alodia did not fall until about 1500.

Nuclear Energy

The energy that holds together the nucleus of an atom is called nuclear, or atomic, energy. Atoms are the basic building blocks of matter. The nucleus is the central part of an atom.

When nuclear energy is released, it changes into other forms of energy. These forms of energy are called radia-

Did You Know?

Much of ancient Nubia now lies under Lake Nasser, which was created when the Aswan High Dam was built across the Nile River in the 1960s.

Nuclear power plants often have huge cooling towers. The towers are used to cool water that becomes heated during the process of creating electricity.

tion. Heat and light are examples of radiation.

How Nuclear Energy Is Released

Nuclear energy can be released through processes called nuclear fusion and nuclear fission. Nuclear fission happens when the nucleus of an atom splits into two or more parts. Nuclear fusion happens when two nuclei join to form a single nucleus. The nuclei of certain kinds of atoms can give off nuclear energy without fission or fusion taking place. These atoms are called radioactive.

Nuclear fusion happens naturally in stars such as the sun. There atoms are constantly combining and creating nuclear energy. That energy is the source of the heat and light that Earth gets from the sun.

In the 1930s scientists discovered that they could make nuclear fission happen in certain kinds of atoms. They made their discovery while working with atoms of the substance called uranium. They split the nucleus of a uranium atom in two by bombarding it with particles called neutrons. Nuclear fission releases a lot of energy. For example, the fission of 1 pound (0.5 kilogram) of uranium produces as much energy as burning 3,000 tons of coal.

Nuclear Weapons

During World War II (1939–45) countries worked to build a weapon that used nuclear energy. The result was the nuclear, or atomic, bomb. The United States dropped the first nuclear bomb on the city of Hiroshima, Japan, on August 6, 1945. The explosion destroyed most of the city and killed more than 70,000 people instantly. Sci-

entists later discovered how to use nuclear fusion to make an even more powerful bomb, the hydrogen bomb.

Nuclear Power Plants

Nuclear energy is used for peaceful purposes, too. In many countries nuclear fission is used in nuclear power plants. The heat it produces runs machines to create electricity.

Nuclear fission in nuclear power plants produces radioactive waste. This waste gives off radiation that can be harmful. Nuclear power plants are designed to be safe. But accidents have happened. In 1986 a very serious accident happened at the Chernobyl nuclear power plant in what is now the country of Ukraine. Radioactive gases leaked out of the plant and into the air. They ruined crops and livestock and caused harm to many people.

Numbers and Number Systems

A number is a basic unit of mathematics. Numbers are used for counting, measuring, and comparing amounts. A number system is a set of symbols, or numerals, that are used to represent numbers. The most common number system uses 10 symbols called digits—0, 1, 2, 3, 4, 5, 6, 7, 8, and 9—and combinations of these digits.

Kinds of Numbers

Numbers can be classified in many ways. The simplest class is the natural, or

A pencil and paper are more useful than fingers as tools for counting.

counting, numbers (1, 2, 3, ...). With the addition of 0, these are known as the whole numbers.

The natural numbers are also called positive numbers because they are greater than 0. For each of the positive numbers, there is also a negative number (−1, −2, −3, ...). Negative numbers are less than 0. The natural numbers, their negative equivalents, and 0 make up the set of numbers called integers. The integers can be pictured as points on a line that continues forever in both directions:

Fractions are numbers that represent parts of a whole. Fractions are written as digits separated by a line, as in $\frac{3}{4}$. The digit below the line is called the denominator. The digit above the line is called

the numerator. In reading a fraction, the numerator is stated first. For example, $\frac{3}{4}$ is read as “three fourths.” Fractions can be shown on a number line, too:

Fractions can also be written in a form called decimals. Decimals are written using the digits (0–9) along with a dot called a decimal point. A fraction can be changed to a decimal by dividing the numerator by the denominator.

Ancient Number Systems

The first system of numbers was probably the tally system. In this system a separate mark was made for every item being counted. This system was useful only with small numbers.

The ancient Egyptians developed a complex system for writing large numbers in symbols called hieroglyphics. There was a single hieroglyphic symbol for the

Electronic calculators help people do many types of math problems.

number 1,000. But to write the number 999, it was necessary to write the symbol for 100 nine times, then the symbol for 10 nine times, and finally the symbol for 1 nine times.

The ancient Romans used letters to represent numbers—I for 1, V for 5, X for 10, L for 50, C for 100, D for 500, and M for 1,000. This system is known as Roman numerals. In Roman numerals, 256 is written as CCLVI.

Base-ten and Other Systems

The most common number system used today is called the base-ten, or decimal, system. It has 10 digits (0–9) that can be combined to write any number. The base-ten system was invented by Hindus in ancient India. Later, Arabs improved the system. For this reason the digits 0–9 are called Hindu-Arabic numerals.

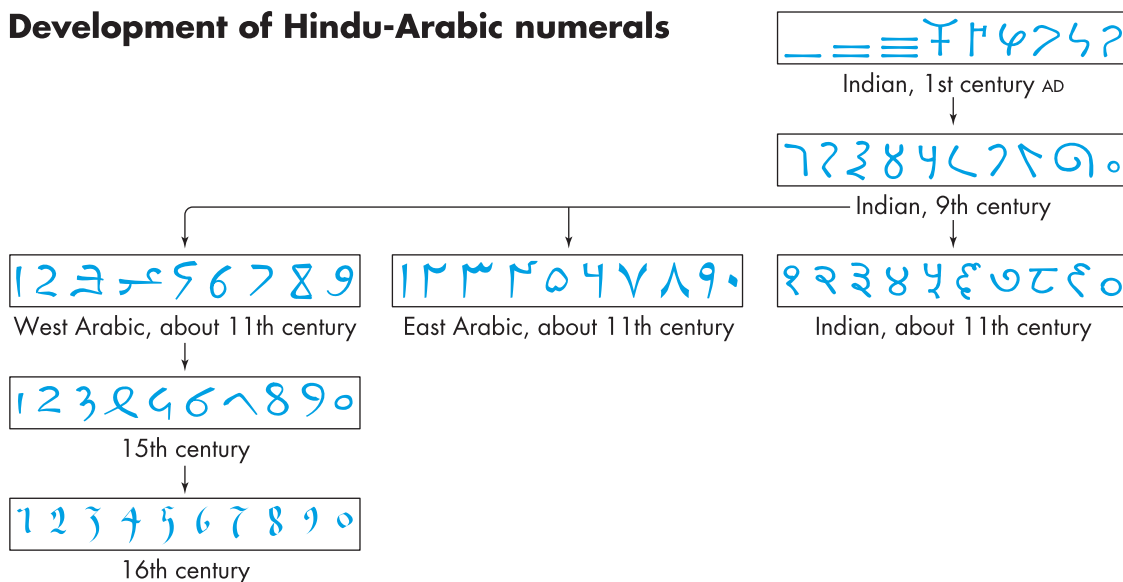

In the base-ten system, the value of each digit is based on its position, or “place,” in a number. There is a “ones place,” a “tens place,” a “hundreds place,” and so forth. In the number 456, for example, the 4 is in the hundreds place, the 5 is in the tens place, and the 6 is in the ones place. Written in another way, the number 456 actually represents $(4 \times 100) + (5 \times 10) + (6 \times 1)$.

For some purposes other number systems are more useful than base-ten. For example, computers use the base-two, or binary, number system. Instead of 10 digits, this system uses only two—0 and 1. In a computer these numbers stand for “off” and “on,” the only two possible states of the computer’s electric switches.

Development of Hindu-Arabic numerals

Hindu-Arabic numerals are now used in most of the countries of the world. It took more than 1,500 years for the numerals to develop their modern shape. People who write in the Arabic alphabet still use an older form of Hindu-Arabic numerals called East Arabic numerals.

Nunavut

Nunavut is Canada's newest territory. It was created in 1999 from the eastern part of the Northwest Territories. The area has been the home of the Eskimo people for a thousand years. The Eskimo in the territory call themselves Inuit. Nunavut means "Our Land" in their language. The capital of Nunavut is Iqaluit.

Geography

Nunavut takes up about one fifth of Canada's area. Nunavut borders on the Arctic Ocean, Hudson Bay, and Baffin Bay. It touches the Northwest Territories and the province of Manitoba. The territory includes most of Canada's Arctic islands.

Nunavut's climate is cold. Snow falls even in the summer. The far northern parts of Nunavut have 24 hours of daylight during the longest days of summer. During the shortest days of winter the sun never appears in those parts. Most of Nunavut's land is tundra, the rocky plain of the Arctic regions.

People

Nunavut has large areas of land where few people live. About 80 percent of the population is Eskimo. The rest of the people have European ancestors. Nunavut has one of the youngest populations in Canada.

Nunavut has fewer than 30 communities. Because there are few roads and no railroads, cities get supplies by airplane or boat. Iqaluit (named Frobisher Bay until 1987) is the largest city. Located on Baffin Island on the eastern edge of Nunavut, it is a communication and transportation center. Rankin Inlet, on the west shore of Hudson Bay, began on the site of a nickel mine. The community remained after the mine closed in the 1960s.

Economy

The largest employer in Nunavut is the government. As Nunavut has begun to build more roads and schools, the construction industry has also grown. Several fish and meat processing plants operate in Nunavut. Lead, zinc, silver, and gold are mined in the territory. Nunavut earns some money from tour-

ism. Still, unemployment remains a serious problem.

Many of the Eskimo still live off the land. They fish, hunt seals, and trap animals. A number of Eskimo make and sell traditional crafts, including soapstone carvings, prints, and tapestries.

History

People have lived in what is now Nunavut for at least 4,000 years. The first people were the Dorset culture, or Tuniit people. In about AD 1000 the Eskimo, who had moved eastward from what is now Alaska, replaced the Dorset culture.

In the late 1500s Europeans began exploring the area. From 1576 to 1578 the English explorer Martin Frobisher made three trips to what is now Nunavut. Europeans later set up a whaling industry there. Great Britain and its Hudson's Bay Company claimed parts

Mosses, herbs, and other low-growing plants cover the tundra of Nunavut.

A Nunavut villager fishes through a hole in the ice.

of the land in the 1800s. In 1870 the land became part of Canada's Northwest Territories.

In the early 1900s the whaling industry collapsed. Fur trading, oil, and mining became important industries. During and after World War II (1939–45) the United States and Canada built airfields and radar stations across the Arctic.

In the 1960s the Eskimo began to ask the Canadian government for control of the land on which they lived. In 1993 Canada voted to create a new territory out of the eastern part of the Northwest Territories. The government granted about 135,000 square miles (350,000 square kilometers) of that land to the Eskimo people. It also promised more than 1 billion dollars to the Eskimo. Nunavut officially became a territory of Canada in 1999.

Did You Know?

Trials were held in Tokyo for the war criminals of Japan. Japan and Germany had fought on the same side in World War II.

Nuremberg Trials

In 1945 and 1946 former leaders of Nazi Germany were put on trial for crimes committed during World War II. The trials were run by the countries that had defeated Germany in the war. They took place in Nuremberg, Germany.

The court that held the trials was called the International Military Tribunal. Judges from the United States, Great Britain, France, and the Soviet Union took part. The defendants (the people put on trial) had been leaders of the German government and the Nazi Party during the war. Adolf Hitler, the top leader of Nazi Germany, could not be tried because he was already dead.

The defendants were accused of crimes against peace, war crimes, and crimes against humanity. The crimes against peace included planning and starting the war. The war crimes were violations of the laws of war. They included enslaving and killing prisoners captured during the war. The worst of the crimes against

Nazi leader Hermann Göring stands in the prisoner's box during his trial for war crimes in Nuremberg, Germany.

humanity was killing millions of Jews and other people in the Holocaust.

Some of the defendants claimed that only the German government, not individual people, could be found guilty. Other defendants claimed that they were not responsible because they were only following orders. The judges rejected both excuses.

All but three of the 22 defendants were found guilty. Ten were put to death. The others received long prison terms.

Nursery Rhyme

Nursery rhymes are short verses and songs for children. Many nursery rhymes tell a quick story in just a few lines. Their clever use of language makes them easy to remember.

Nursery rhymes are entertaining for children to hear. They often have silly subjects. They also use amusing patterns of sound and rhythm. Most of them rhyme, or repeat the sounds at the ends of certain lines—as, for example, in “Hey, diddle, diddle / The cat and the fiddle” or “Along came a spider / And sat down beside her.” Children can learn speech patterns from such poems. This can help them to become better readers and speakers.

Most nursery rhymes date from the 1500s through the 1700s. Many of them were originally created as popular

songs for adults. For many years nursery rhymes were only spoken aloud, not written down. The earliest known book of nursery rhymes was published in 1744.

A make-believe old woman named Mother Goose first appeared in a British book of nursery rhymes from the 1760s. It has become traditional to say that Mother Goose writes nursery rhymes, but she is just a character. No one knows who wrote most nursery rhymes.

Nursing

Nurses make up the largest group of health care workers in the world. They work with doctors and other medical providers to care for people who are sick or injured.

What Nurses Do

Most nurses work along with doctors in hospitals, clinics, or offices. They often work with nurse's aides or assistants, too. Nurses find out about a patient's health by asking questions. They also check such signs as blood pressure and temperature. Nurses give medicine, change bandages, help patients move around, and provide other treatment. They give advice on how to get well and how to stay healthy. They comfort frightened patients and worried family members.

A nurse listens to a patient's heart with a stethoscope.

Many nurses specialize in a certain area. Some nurses assist doctors during surgery. Some care mainly for children or the elderly. Others care for patients with mental illnesses. Still other nurses help patients in private homes.

Some nurses work more independently, with less instruction from doctors. Nurse practitioners examine patients and manage their care. Nurse midwives deliver babies. These nurses generally need more education and training than other nurses.

History

Throughout history family members and religious people have cared for the sick. But the profession of nursing did not exist until fairly recently.

One pioneer in the field of nursing was Florence Nightingale. During the Crimean War (1854–56) she nursed

British soldiers and worked to improve conditions in hospitals. In the United States Clara Barton played a similar role. She and other women cared for sick and wounded men fighting in the American Civil War (1861–65).

The profession of nursing developed along with the rise of hospitals around the world. As the demand for hospital nurses grew in the early 1900s, more nursing schools opened. During this time nursing was one of the few professions acceptable for women, and most nurses were women. That changed gradually. Today women can be doctors or nurses. Similarly, both men and women now work as nurses.

Nut

A nut is a dry, hard fruit that contains one seed. The hard layer that surrounds the seed is known as the shell. People remove

The hazelnut seed can be seen when the shell is split open. The seed is the part that people eat.

the shell, often by cracking it open, before eating the seed. Nuts grow on trees in many parts of the world.

True nuts include acorns, beechnuts, chestnuts, and hazelnuts. Acorns grow on oak trees. A scaly cap that develops from a flower holds each acorn. Beechnuts grow on beech trees, and chestnuts grow on chestnut trees. These nuts develop inside prickly cases. Hazelnuts, also called filberts, grow on filbert trees. Hazelnuts grow inside leafy husks.

Many of the foods that people think of as nuts are not true nuts. Peanuts are actually legumes, or fruits in the form of pods. People eat the seeds inside the pods. Almonds, macadamia nuts, pistachios, pecans, and walnuts are the pits of fruits called drupes. Each pit is a shell that holds a seed. Brazil nuts are seeds that grow in woody pods. Pine nuts are seeds that grow in pinecones.

People and animals eat many kinds of nuts. Nuts are a rich source of protein and fat. People often roast nuts before eating them. They also use them in baked goods and other dishes. In addition, people use the oils contained in some nuts to make paints, soaps, and other products.

Oak

The branches of a white oak spread wide.

Oaks are trees and shrubs of the beech family. There are about 450 species, or types, of oak. They are common in places with mild weather.

Oak trees can grow to 150 feet (45 meters) high. They have thick trunks and large branches that spread wide. The leaves can have rounded, rough, or smooth edges. The fruit of an oak tree is the acorn—a round nut in a woody cup. New oaks can grow easily from acorns.

The English oak is the largest of the oak trees. Some oaks in England are more than 800 years old. The English oak has sturdy limbs and a stout body. The zig-zag growth of the limbs in older trees gives them a twisted look.

The white oak is common in the United States. The leaves are light green above and whitish beneath. In autumn the leaves turn deep violet. They cling to the tree throughout the winter. They fall just before new leaves appear.

Oaks have many uses. The wood of many types of oak is valued in carpentry and building. Cork comes from the bark of the cork oak. Some oaks are grown to decorate gardens. Some small animals eat acorns.

Oats

Oats are a grain that is grown throughout the world. Grains are grasses that produce seeds that can be eaten. Russia and Canada are leading oat-producing countries. The scientific name of the oat plant is *Avena sativa*.

Oat plants grow to about 2 to 5 feet (0.6 to 1.5 meters) tall. A plant usually produces more than one stem. The oats are seeds, or kernels, that grow on little

People and animals eat the nutritious seeds called oats.

branches at the end of each stem. One plant can produce dozens of kernels.

Oats are used mostly to feed farm animals. Farmers make straw from the parts of the plants that the animals do not eat. Oat straw is used as animal bedding.

People eat oats in the form of rolled oats and oat flour. Rolled oats are made from oat grains that have been steamed and flattened between rollers. They are cooked in water to make oatmeal. They are also used in breads, cookies, and other products. Oat flour is often mixed with wheat flour and used in breakfast cereals and baked goods. Oat bran, the outer covering of the oat kernel, is full of nutrients.

Obama, Barack

Barack Obama was the first African American to be elected president of the United States. In 2008 he defeated John McCain to become the country's 44th president.

Early Life

Barack Hussein Obama II was born on August 4, 1961, in Honolulu, Hawaii. His parents had met while they were both students at the University of Hawaii. His mother, who was white, came from Kansas; his father, Barack Obama, Sr., was from Kenya. When young Barack was 2 years old, his parents divorced. His father eventually returned to Kenya. His mother later

Barack Obama was the 44th president of the United States.

married a man from Indonesia, and Barack lived in Indonesia between the ages of 6 and 10. He then returned to Hawaii and lived with his mother's parents.

Education and Early Career

Obama graduated from Columbia University in New York in 1983. He then moved to Chicago and worked for a group helping low-income people on the city's South Side. After three years there, he entered Harvard Law School. He graduated with honors in 1991. Obama returned to Chicago to practice law. He worked on issues of civil rights. He also taught law at the University of Chicago.

Political Career

During this period Obama became active in the Democratic Party. In 1996 he was elected to the Illinois Senate. In 2004 he was elected to the U.S. Senate from Illinois. Obama quickly became a major figure in his party.

In 2007 he decided to run for president of the United States. He ran against several people, including Hillary Clinton, in the primary elections. In primary elections voters elect delegates to go to a convention in the summer. The delegates are supporters of a candidate. They vote at a national convention to choose the person who will be the candidate for the party in the general election in November. Both Obama and Clinton won many delegates, but Obama won the most delegates. At the convention in August the delegates chose Obama to be the candidate for the Democrats. Obama chose Senator Joseph Biden to be his running mate.

Obama sought to bring people of many backgrounds together to improve the lives of everyone in the country. One of the major issues during the campaign was the ongoing war in Iraq. The United States and other countries had invaded that country in 2003. Obama had spoken out against the war before it started.

Obama was also concerned about making health care available to everyone in the United States.

In the fall of 2008 the U.S. economy began to fall apart. Many people faced serious troubles. They were unhappy with the government of President George Bush because of that. They were also unhappy about the ongoing war in Iraq. Both issues became important in the campaign for president. Obama offered the voters a change. His opponent, John McCain, was associated with Bush because they were both Republicans. On November 4 the voters chose Obama over McCain.

Obama wrote several books about his life and his views on major issues of the day. His books include *Dreams from My Father* (1995) and *The Audacity of Hope* (2006).

Ocean

An ocean is a huge body of salt water. Oceans cover nearly 71 percent of Earth's surface. They contain almost 98 percent of all the water on Earth.

There are four main oceans on Earth: the Pacific, the Atlantic, the Indian, and the Arctic. These oceans have no real borders, and water flows freely between them. Smaller parts of these oceans are called seas, gulfs, and bays.

Ocean Water

Ocean water is salty. The saltiness comes from a chemical substance called sodium chloride, which is dissolved in the water. (The salt that people eat is sodium chloride in the form of crystals.)

Winds and other forces cause ocean water to move around Earth in patterns called currents. Ocean currents may be

warm or cold. Warm currents tend to bring warm weather and rain to nearby land. Cold currents tend to cause a dry climate. The Gulf Stream is a warm current that runs north along the eastern coast of the United States.

Winds also cause ocean water to move in waves. Steady, powerful winds cause big waves. Gentle breezes create ripples. Large swells in ocean water usually come from stormy weather. Earthquakes or other forces cause the huge, destructive waves called tsunamis.

Tides are another way that ocean water moves. Tides are the rise and fall of ocean levels. This happens throughout the day. On a beach, for example, the ocean covers more sand at high tide than at low tide. The pull of a force called gravity between Earth and the Moon and the sun causes tides.

The four major oceans cover most of Earth's surface.

Ocean Floor

The ocean floor has many levels. The shallowest part of the oceans, called the continental shelf, lies along the edges of the continents. The edges of the continental shelf slope down toward the deep parts of the oceans, called the basins. At the bottom of the basins are large, flat plains.

In some places, deep cracks called trenches cut into the ocean floor. In other places, underwater mountain chains, called oceanic ridges, rise up from the floor. Earthquakes sometimes occur along the trenches and ridges. Parts of the ridges contain active volcanoes.

Ocean Life

Living things inhabit all levels of Earth's oceans. Ocean plants grow fairly close to the water's surface because they need sunlight to stay alive. Sunlight penetrates the water to only about 650 feet (200 meters). The most numerous ocean plants are called phytoplankton. These tiny, one-celled plants drift with the ocean currents. Various kinds of sea grass and other plants also grow in the world's oceans. Seaweeds, which are plantlike forms of algae, are plentiful as well.

Like ocean plants, most ocean animals live in shallower water. This is because there are more plants and animals to eat near the water's surface. But animals also can be found in deep water, including within the oceans' deepest, darkest trenches.

The largest ocean animal is the blue whale. No larger animal has ever lived

Tube worms grow near a vent, or opening in the seafloor.

on Earth. The tiniest animals are a form of plankton called zooplankton. Hundreds of thousands of other types of animal also live in the ocean. These include clams, crabs, squid, dolphins, and many different kinds of fish.

Importance of the Oceans

The world's oceans are important to life on Earth. Oceans are a great source of food for people around the world. They also provide minerals, oil, and natural gas. Phytoplankton and algae create much of the world's oxygen. Oceans also help to keep climates stable by storing heat from the sun.

Today many dangers threaten the health of the oceans. People pollute oceans by dumping poisonous waste and garbage into them. Ocean pollution reduces oxygen in the water and harms ocean life. Overfishing and oil spills harm ocean life as well.

Some oceanographers use small submarines to study the plants and animals in oceans.

People called oceanographers study the oceans to try to keep them healthy. Some examine the quality of the water and the way the water moves. Others look at the structures of the seafloors and basins. Others are interested in the plants and animals that live in oceans.

Oceania

Thousands of islands scattered across the Pacific Ocean are grouped together under the name of Oceania. The region is generally divided into three major areas: Melanesia, Micronesia, and Polynesia. Sometimes a fourth area, called Australasia, is also considered to be a part of Oceania. This area includes Australia, New Zealand, and nearby islands.

Land and Climate

Although they lie in a vast expanse of ocean, the islands of Oceania take up a relatively tiny amount of land. Not

counting New Zealand, New Guinea, and Australia, their combined land area is only about 42,000 square miles (109,000 square kilometers).

Melanesia

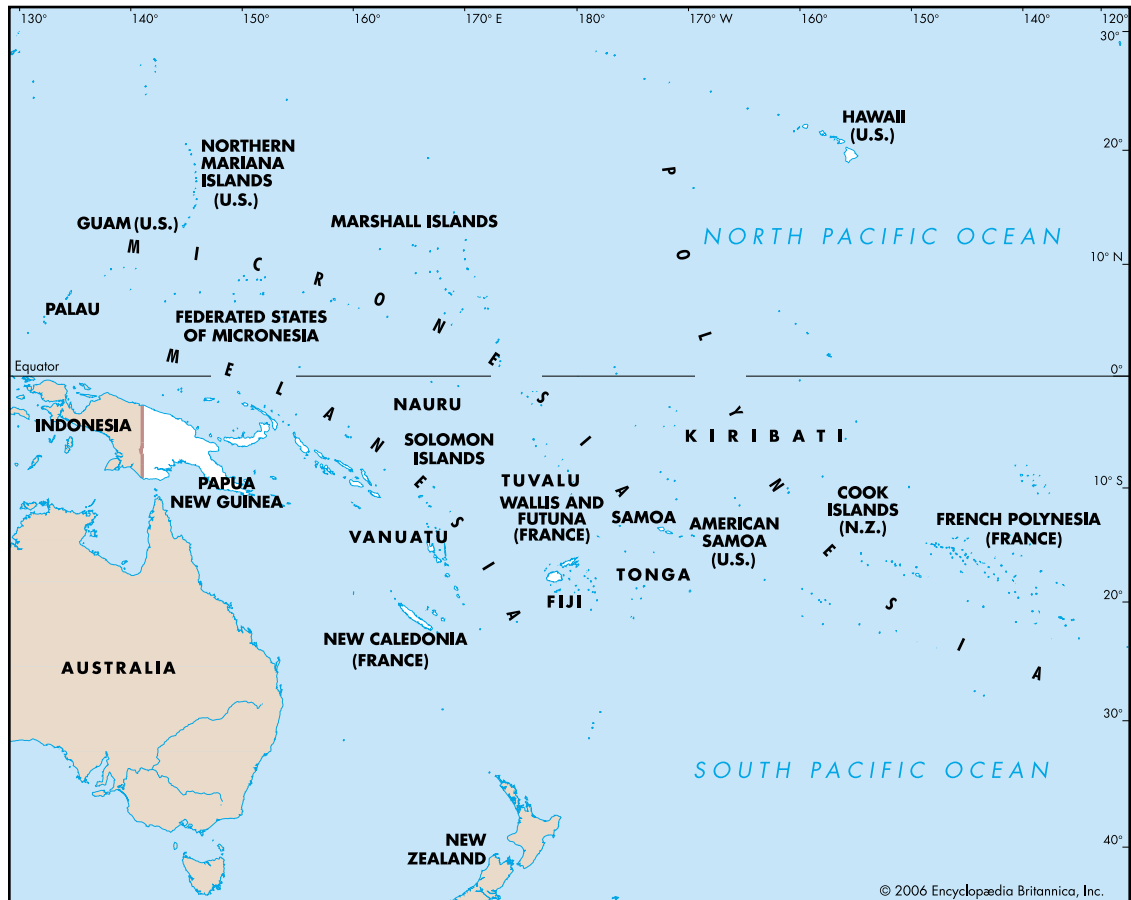

The islands of Melanesia lie north and east of Australia. Melanesia includes the countries of Papua New Guinea, the Solomon Islands, Vanuatu, and Fiji. It also includes the French territory of New Caledonia. The name Melanesia means “black islands.” Europeans gave the islands this name because many of the people who live there have dark skin.

Micronesia

East of the Philippines and mostly north of the equator are the islands of Micronesia. Micronesia means “small islands.” The region stretches from the country of Palau in the west to the country of Kiribati in the east. Other Micronesian countries are the Federated States of Micronesia, the Marshall Islands, and Nauru. The area also includes Guam, which is a U.S. territory and a part of the Mariana Islands.

Many islands in Oceania have warm weather and sandy beaches. These features attract tourists from around the world.

Polynesia

The islands of Polynesia lie generally east of Micronesia and Melanesia. Polynesia means “many islands.” Polynesia includes the countries of Samoa, Tonga, and Tuvalu. Other Polynesian islands include Hawaii (a U.S. state); American Samoa (a U.S. territory); the Cook Islands (associated with New Zealand); Easter Island (ruled by Chile); and French Polynesia and Wallis and Futuna (territories of France).

Climate

As a tropical region, Oceania has mostly warm weather with very little temperature change from season to season. Many parts of the western Pacific receive more than 80 inches (200 centimeters)

of rain each year. When humidity is high, strong circular storms called typhoons can develop over water. (The same kind of storm is known as a hurricane in the Atlantic Ocean.)

Plants and Animals

The native plants of most islands in Oceania grew originally in Asia. They spread eastward by way of Indonesia and New Guinea. Islands close to the mainland tend to have more kinds of plants than islands far out to sea. Shrubs, vines, and coconut palms are found near the coasts, and mangroves grow in salt marshes. Banana trees, breadfruit trees, and papaya plants grow farther inland. Rain forests are a feature of many high islands.

Ducks and seabirds, such as frigate birds, albatrosses, and boobies, live throughout Oceania. Most islands have some snakes and lizards. Reefs and lagoons shelter many kinds of fish as well as lobsters, shrimps, snails, eels, octopuses, and turtles. Bigger fish, such as swordfish and marlins, lurk in deeper waters, as do whales, porpoises, and sharks.

People

In all the areas of Oceania (not including Australia), there were only about 12 million people at the start of the 21st century. The country with the most people is Papua New Guinea. New Zealand, Hawaii, and Tonga also have large populations. Micronesia is the region with the fewest people.

The people of Oceania may be divided into Melanesians, Micronesians, and Polynesians, based on their area of origin. However, within these groups are many smaller groups of people that speak hundreds of different languages. Many people follow traditional beliefs, but Christianity is also an important religion.

Most people in Oceania live in villages, where they farm or fish for a living. Outside Australia and New Zealand, the only really big city in Oceania is Honolulu, Hawaii.

Economy

All three regions of Oceania produce coconut products like copra (dried coconut meat) and coconut oil. They sell these products to the rest of the world in large quantities. Fish and other sea creatures are also important to the economy. Farmers grow sugarcane in Fiji and Hawaii. On the Solomon Islands and Vanuatu, people harvest timber. Gold and oil are found in Papua New Guinea, while New Caledonia has nickel mines. Tourism is an important source of money in many areas.

History

Melanesia was the first region of Oceania to be settled. Speakers of Papuan languages may have occupied New Guinea, which was then joined to Australia, as early as 50,000 years ago. Papuan peoples became farmers as early as 9,000 years ago. They grew sugarcane and root crops.

Did You Know?

One of the wettest places on Earth's surface is Mount Waialeale on Kauai Island, Hawaii, which gets about 460 inches (1,168 centimeters) of rain per year.

Dancers perform in a cultural show in Papua New Guinea, which is part of the region called Oceania. They wear costumes and face paint that are traditional to their ethnic group. Papua New Guinea has hundreds of different ethnic groups.

Easter Island, in Polynesia, is known for the large stone statues that were carved there hundreds of years ago.

Seagoing people, known as the Lapita, moved into the areas north of New Guinea about 4,000 years ago. The Lapita were probably from Southeast Asia. Over hundreds of years they settled Polynesia and Micronesia. The Polynesian Maori people reached New Zealand in about AD 800. By this time, settlement of the Pacific islands was just about complete.

In 1521 the Portuguese explorer Ferdinand Magellan became the first European to sail through Oceania. Spanish, Dutch, and English voyagers followed. The English explorer James Cook traveled throughout the region in the 1700s.

In the 1800s France, Great Britain, Germany, and the United States claimed parts of Oceania. These areas, known as colonies, stayed under foreign control until the 1900s. Many island groups gained independence after 1962. However, foreign countries still control some parts of Oceania.

Ocelot

The ocelot is a spotted cat of the Americas. It is found in tropical forests and grasslands from the U.S. state of Texas to Argentina. The scientific name of the ocelot is *Leopardus pardalis*.

The ocelot is a slender animal. An adult is about 28 to 35 inches (71 to 89 centimeters) long, not including the tail. It weighs about 25 to 35 pounds (11 to 16 kilograms). Females are usually smaller than males.

The ocelot has short, smooth fur. It is yellowish with long, black-edged spots. There are small black spots on the head, two black stripes on each cheek, and

The ocelot is a wild cat that lives in parts of North and South America.

black stripes along the neck. The underside of the body is white with black spots.

The ocelot hunts mainly at night. It eats rodents, birds, reptiles, and fish. It stays mostly on the ground. But it also is a good climber, and it can swim.

About 70 days after mating, a female ocelot gives birth to two or three young. The babies are darker than the adults but have a similar coat pattern. The mother cares for her kittens in a den.

People capture ocelots for their fur and to sell as pets. As a result the ocelot has declined in number. Ocelot hunting is banned in the United States and other countries.

Octopus

An octopus is a sea animal with eight arms. There are more than 150 species, or types, of octopus. They belong to the group of animals called mollusks, which also includes squid, clams, and oysters. Octopuses live in seas throughout the world.

An octopus has a soft, baglike body and large eyes. Its long, slender arms reach out in all directions. Each arm has two rows of cuplike suckers with great holding power.

Octopuses vary greatly in size. The smallest are only about 2 inches (5 centi-

An octopus swims near the surface of the water.

meters) long. The largest may be 18 feet (5.5 meters) long and have a 30-foot (9-meter) arm span.

An octopus can change color quickly depending on its surroundings or its mood. It can be gray, brown, pink, blue, green, or even an angry red if it is suddenly frightened.

An octopus usually crawls along the ocean bottom on its arms searching for food. It eats mainly crabs and lobsters. Skillful hunters, octopuses also attack large prey such as sharks. If an octopus is in danger, it shoots a jet of water out of its body. This moves the octopus backward very quickly. An octopus also may release an inky fluid to darken the water and confuse an enemy.

A female octopus lays her eggs under rocks or in holes. She guards the eggs for four to eight weeks. Upon hatching, the young drift for several weeks before going to the ocean bottom.

Odin

Odin was one of the chief gods of the early people of Scandinavia in northern Europe. In their mythology (called

In Norse mythology, Odin was one of the chief gods. He protected warriors and poets.

Norse mythology), they imagined Odin as an old man with a gray beard and only one eye. He gave up the other eye in exchange for wisdom. Other names for Odin include Wotan and Woden. Wednesday (“Woden’s day”) is named for him.

Odin was the god of warriors and poets. He was also a magician. His magical spear always hit its target. In addition, Odin was important in Norse myths about creation. He and his two brothers were said to have made the first human beings, Ask and Embla. The gods created the humans from tree trunks found on the seashore.

Odin’s wife was Frigg, the goddess of marriage. Thor, the god of thunder, was Odin’s son. Odin’s daughters included the Valkyries. The Valkyries met fallen heroes on the battlefield. They brought the dead heroes to stay at a grand banquet hall called Valhalla. Valhalla was like a heaven for warriors.

According to legend, Odin had two ravens, named Thought and Memory. Each day he would send the birds out into the world. When they returned, they would tell Odin all they had seen. For that reason Odin was called the raven god. Odin also had a magical horse, called Sleipnir. It had eight legs and could gallop through the sky and across the sea. Two wolves, named Geri and Freki, followed Odin as well.

Ohio

The U.S. state of Ohio was named after its local river. The name of both the Ohio River and the state comes from the Iroquois Indian word meaning “great river.” Ohio’s location makes it an important transportation crossroads between the Eastern states and the Midwest. Throughout the state’s history, cargo and passengers have been carried by way of Lake Erie and the Ohio River.

Ohio is nicknamed the Buckeye State after a tree found throughout Ohio. Columbus is the capital of the state.

Geography

Ohio is in the north-central part of the United States. It is bordered on the east by Pennsylvania, on the north by Michigan and Lake Erie, and on the west by

Indiana. The Ohio River in the south separates Ohio from West Virginia and Kentucky.

Ohio has three natural regions. The eastern half of the state is part of the Appalachian plateau. Western Ohio is a gently rolling plains region known for its soil that is good for growing crops. The lake plains stretch along the southern shore of Lake Erie. Ohio has warm summers and cool winters.

People

Many of Ohio’s earliest white settlers came from the Eastern states. Today about 85 percent of the state’s population is white. African Americans represent about 12 percent of the population and are Ohio’s largest minority group. Asians and Hispanics together make up less than 4 percent of the population.

Economy

For many years manufacturing has been the most important part of Ohio’s economy. Many workers are involved in making motor vehicles, metal products, and other goods. Ohio has a long history in manufacturing rubber automobile tires.

Like many other states, however, Ohio became more dependent on service-oriented industries in the late 20th century. Health care, business services, and finance were among the industries that expanded during this period. Farming plays a small but important role in the

state's economy. The chief agricultural crops are soybeans and corn.

History

People have lived in the Ohio area for thousands of years. Southern Ohio was the home of two famous prehistoric Native American groups—the Adena and Hopewell cultures. Both groups vanished before AD 500, but they left behind many large earth mounds. Other Native American groups took their place.

Historians believe that the French explorer Sieur de La Salle reached the area in 1669. The French claimed the Ohio territory two years later. In 1763 the land passed from France to Great Britain. The area became part of the United States after the American Revolution (1775–83). It was included in the region known as the Northwest Territory in 1787.

The arrival of white settlers led to conflict with the Native Americans in the region. The fighting ended with the defeat of the Indians in the battle of Fallen Timbers in 1794. With the fighting over, settlements sprang up throughout the region. Ohio became the nation's 17th state in 1803.

Improved transportation helped the state grow. In the 1830s the Ohio and Erie Canal, the Cumberland Road, and the first horse-drawn railroad were completed. By 1850 Ohio was the third most populous state in the nation. Ohio stayed in the Union during the American Civil War (1861–65).

About half of Ohio's land is used for farming.

A waterway called the Saint Lawrence Seaway opened up the Great Lakes to oceangoing ships. Cleveland, Toledo, and other cities on Lake Erie became seaports after the seaway was completed in 1959.

Cleveland and other industrial cities struggled economically near the end of the 1900s. One bright spot for Cleveland was the opening of the Rock and Roll Hall of Fame and Museum in 1995.

Ohio River

The Ohio River begins at Pittsburgh, Pennsylvania, where the Allegheny and Monongahela rivers come together. It flows northwest out of Pennsylvania and then turns southwest to join the Mississippi River in Illinois. It is 981 miles (1,579 kilometers) long.

The Ohio River forms the state borders between Ohio and West Virginia; Ohio and Kentucky; Indiana and Kentucky; and Illinois and Kentucky. The longest river that feeds into the Ohio is the Tennessee River, which begins in the Appalachian Mountains. The Tennessee River flows into the Ohio at Paducah, Kentucky.

The Ohio serves such large cities as Pittsburgh; Cincinnati, Ohio; and Louisville, Kentucky. These cities and others use the river to transport coal, oil, steel, and many manufactured goods.

The French explorer known as the Sieur de La Salle is said to have been the first European to see the Ohio River. He reached it in 1669. By 1763 the British controlled the river. The United States

Ojibwa

The Ojibwa are Native Americans of the northern United States and southern Canada. Their land once spread all the way from the northern Great Lakes to what is now Montana. The Ojibwa in the United States are often called the Chippewa. In certain parts of Canada the Ojibwa are called the Mississauga or the Saulteaux. Many Ojibwa prefer to be called Anishinabe, which means “first people.”

The Ojibwa traditionally grew corn, beans, pumpkins, and squash. They also hunted and fished and gathered wild plant foods. They lived in dome-shaped houses made from wood and birch bark.

A photograph from the 1800s shows Ojibwa with their weapons.

Long ago the Ojibwa were part of a larger group that also included the Ottawa and the Potawatomi. French explorers arrived on Ojibwa lands in 1622. The Ojibwa traded with the French and helped them in war.

In the 1880s the Ojibwa had to give up much of their land and move to small reservations. In the late 20th century there were more than 100,000 Ojibwa in the United States. Many lived on reservations in Michigan, Wisconsin, Minnesota, North Dakota, and Montana. Thousands more Ojibwa lived in Canada. They had land in the provinces of Ontario, Manitoba, and Saskatchewan.

Okefenokee Swamp

The Okefenokee Swamp is a large wetland in the southeastern United States.

It is an important wildlife refuge. This means that animals and plants that live there are protected.

The Okefenokee Swamp is in southeastern Georgia and northeastern Florida. The swamp is part of an area that was at the bottom of an ocean a long time ago. It is now filled with lakes and floating islands of peat. Peat is a type of soil made when dead plants build up in layers. The peat islands have trees and plants. The trees of the swamp include giant tupelos and bald cypresses. Some of the trees in the swamp are 900 years old. The swamp also has grassy areas.

The swamp is home to many animals, including birds, alligators, deer, foxes, otters, and bears. Many of the animals that live in the swamp are endangered. This means that they are in danger of dying out forever.

Native Americans once lived in the swamp. Later people cut down many of the swamp's trees to build houses and other structures. Today, the government protects the swamp.

Oklahoma

The U.S. state of Oklahoma took its name from the Choctaw Indian words meaning “red people.” For much of the 1800s Oklahoma was Indian Territory—land set aside by the U.S. government for Native Americans. In 1889, however, the land was opened to white settlement. The nickname Sooner State came from settlers claiming land in the territory sooner than the official opening date. The state capital is Oklahoma City.

Geography

Oklahoma is in the south-central part of the United States. In the south the Red River separates Oklahoma from Texas. Texas also borders Oklahoma south of the Panhandle, a long, narrow stretch of land in the northwestern part of the state. East of Oklahoma are Arkansas and Missouri. Kansas and Colorado are to the north, and New Mexico is to the west.

Oklahoma is primarily a plains state. The central part of the state alternates between hill and plain. In the south is a mountainous region. To the northeast is the Ozark Plateau, an area of scenic but rough land. Oklahoma’s weather is normally pleasant. In the spring, however, the state can be hit by tornadoes.

People

About three fourths of all Oklahomans are whites of European heritage. African Americans and Native Americans make up about 8 percent each of Oklahoma’s

population. Oklahoma ranks third in the country—following Alaska and New Mexico—for the percentage of Native Americans in its population. About 5 percent of the people are Hispanic.

Economy

For much of Oklahoma’s history, petroleum (oil) and gas production have been a major part of the economy. In agriculture, the raising of cattle and calves is the biggest source of income. Manufacturing industries make processed foods, industrial machinery, and metal products. Oklahoma is a national leader in the aerospace industry. Service industries employ about two thirds of the workforce in jobs ranging from teachers to computer programmers to government workers.

History

Indian tribes such as the Caddo, Wichita, and Pawnee were living in the Oklahoma area when Europeans first arrived. The Spanish explorer Francisco Coronado claimed the area for his coun-

try in 1541. Spain controlled the region until 1800, when it became French territory. In 1803 the United States acquired the region from France as part of the Louisiana Purchase.

In 1834 the U.S. Congress made the Oklahoma area Indian Territory and required all whites to leave. During the 1830s the U.S. government forced five tribes from the Southeast—the Choctaw, Creek, Chickasaw, Seminole, and Cherokee peoples—to move to Indian Territory. The Cherokee's difficult trip from their homeland to Indian Territory became known as the Trail of Tears. By 1880 more than 60 tribes had moved to Indian Territory.

Eventually people began to ask Congress to open the Indian Territory to white settlers. Congress purchased land in the

central part of what is now Oklahoma. This area, named Oklahoma Territory, was opened to new settlement on April 22, 1889. Settlers rushed into the area to claim the free land.

Oklahoma was admitted to the Union as the 46th state in 1907. During the 1930s a severe drought hit Oklahoma and other neighboring states. The drought-stricken areas became known as the Dust Bowl because the land became so dry that the soil was blown away. The drought ended by the early 1940s. Oklahoma's economy improved during World War II (1939–45) and the post-war period.

On April 19, 1995, Oklahoma City was the site of one of the worst terrorist attacks in U.S. history. A powerful homemade bomb heavily damaged the Alfred P. Murrah Federal Building. Hundreds of people in the building were either killed or injured.

Oklahoma City

Population
(2000 census),
city, 506,132;
(2007 estimate)
547,274

Oklahoma City is the capital of the U.S. state of Oklahoma. The city lies on the North Canadian River.

Many industries related to oil and airplanes are located in Oklahoma City. Oil is both drilled and processed in the city. Oklahoma City is home to a U.S. Air Force base and a large government air center. Factories in Oklahoma City make airplanes, electronics, machinery, and steel.

Many people in Oklahoma City work for the government. Education, health care, and other service industries also bring money to the city. Oklahoma City

has long been a center for the sale and transport of cattle.

Oklahoma City began in 1889. In that year about 10,000 settlers claimed available land around a railway station. The city became the capital of Oklahoma in 1910. It grew rapidly after oil was discovered there in 1928.

In 1995 two men who were angry with the U.S. government bombed the Alfred P. Murrah Federal Building in Oklahoma City. The terrorist bombing killed 168 people and injured more than 500 others.

Olive

Since ancient times people have grown olive trees for their fruit and the oil it contains. For the ancient Greeks an olive branch loaded with fruit was a symbol of peace.

People on the Greek island of Crete grew olive trees as far back as 3500 BC. Later other countries along the Mediterranean Sea also began growing olives. Today olive trees are found in many parts of the world.

Olive trees have long been admired for their beauty. Their leaves are dark green on top and silvery on the underside. The olive tree has a twisted trunk. Most olive trees are 10 to 40 feet (3 to 12 meters) tall or more.

Did You Know?

Ancient people cooked with olive oil, burned it in lamps, and used it in ceremonies.

The Oklahoma City National Memorial honors those killed in a terrorist bombing in 1995. The memorial includes 168 chairs to represent the 168 people who died.

Olives cannot be eaten fresh from the tree because they are too bitter. Many olives are processed so they can be eaten. Others are pressed to make oil.

Olive trees bloom in late spring. Some of their small, white flowers grow into the olive fruits. Inside the fruit is a stone. It holds one or two seeds.

Olives are often picked when they are still unripe and green colored. Fresh olives are very bitter. They must be processed, or treated with salt or other chemicals, before they can be eaten. Most olives are grown to make olive oil. Olives and olive oil are used in many dishes from the Mediterranean area.

Olmec

The Olmec Indians developed the first major civilization in what is now Mexico. It lasted from about 1200 to 400 BC.

The Olmec lived in hot, humid lands along the coast of the Gulf of Mexico. This land is now in southern Mexico. The Olmec built cities where they came together to trade and perform ceremonies. Farmers lived outside the cities. Corn was their main crop.

The Olmec had many achievements. They developed a number system, a calendar, and a system of picture writing. They made pottery and small jade sculptures. They traded these items with other Indians.

The Olmec are known for having carved huge heads from basalt, a type of volcanic rock. These sculptures were up to 10 feet (3 meters) tall and weighed up to 20 tons.

Historians do not know for sure what happened to the Olmec. Other Indians might have invaded and wiped out the Olmec. Or the Olmec might have suffered from crop failures or disease. Later Indians of Mexico and Central America kept some Olmec customs. These Indians included the Maya, the Toltec, and the Aztec.

Olympic Games

The Olympic Games are the world's leading sports event. Athletes from more than 200 countries compete in them. The Olympics include the Summer Games and the Winter Games. Each is held in a different country once every

four years. Until the early 1990s the Summer and Winter Games were held in the same year. Today they are separated by two years.

Organization and Flag

The International Olympic Committee (IOC) governs the Games. The IOC decides on the sports to include in the Olympics. It also chooses the cities that will host the Games. In addition to the IOC, each country has its own national Olympic committee.

The flag of the Olympic Games has five linked rings on a white background. The rings represent the five parts of the world joined together by the Games: the Americas, Europe, Asia, Africa, and Australia. The rings are blue, yellow, black, green, and red. The colors of the rings and the white background came from national flags. At least one of the colors appears in every country's flag.

Events

The Summer Games and the Winter Games include different sports that fit the different seasons. There are individual and team events for men and for women. Some events are held indoors, others outdoors.

The Summer Games have a wider variety of events than the Winter Games. The most popular events at the Summer Games include gymnastics, swimming, and track and field. Other events include baseball, basketball, boxing, cycling, diving, judo, sailing, soccer, softball, volleyball, water polo, weight lifting, and wrestling.

Did You Know?

World Wars I and II interrupted the Olympic Games. There were no Games in 1916, 1940, or 1944.

Ice skating and skiing are crowd favorites at the Winter Olympics. Skating events include graceful figure-skating competitions as well as speed-skating races. Ice hockey is a popular team event. The biathlon combines skiing and shooting. The Winter Games also include high-speed races on sleds called bobsleds and luges.

The list of Olympic events can change. Sometimes popular new sports are added to the Games. In the late 20th century, for example, mountain biking, beach volleyball, and windsurfing became events at the Summer Games. Snowboarding was added to the Winter Games.

A victory ceremony is held during the Games after the end of each event. Medals are awarded for first, second, and third place. In order from first to third, the medals are gold, silver, and bronze. The flags of the winners' countries are raised while the national anthem of the gold medal winner is played.

A big ceremony marks the end of the 2006 Winter Olympics in Turin, Italy.

Footraces of various distances are important parts of the Summer Olympics.

History

The first Olympic Games for which there are written records took place in Greece in 776 BC. The ancient Games continued until a Roman emperor stopped them in AD 393.

For the next 1,500 years there were no Olympics. In the late 1800s a Frenchman named Pierre de Coubertin worked to revive them. The first modern Olympic Games were held in 1896 in Athens, Greece. At those Games a Greek shepherd named Spyridon Louis became a national hero when he won a new race called the marathon. The first Winter Games were held in 1924.

For about 80 years only amateur athletes were allowed to take part in the Games. Amateur athletes are not paid. But since the 1970s professional athletes have been allowed to compete in many Olympic events.

Olympus, Mount

The highest mountain peak in Greece is Mount Olympus. It reaches a height of 9,570 feet (2,917 meters) above sea level. Mount Olympus is on the border of the Greek regions of Macedonia and Thessaly.

The ancient Greeks believed that their gods lived on Mount Olympus. From that height the gods were thought to watch over and take part in the lives of humans.

Omaha

The Omaha are Native Americans who live in Nebraska. The city of Omaha is named after the tribe.

The Omaha lived in earth lodges. They made these homes by covering a dome-shaped wooden frame with mud. The Omaha grew corn, beans, squash, and other vegetables. They also fished and hunted. They left their villages twice a year to hunt bison (buffalo). While hunting they lived in tents called tepees, which they covered with bison hides.

The Omaha were once part of a larger group that lived in what is now the eastern United States. The group also included the Osage, the Kaw, the Quapaw, and the Ponca. The group eventually moved west and split up. In the mid-1600s the Omaha settled along the Missouri River in what is now Nebraska.

The Omaha generally lived in peace with white settlers who came to their territory. However, the settlers brought smallpox and other diseases that killed many Omaha.

In 1854 the Omaha sold most of their land to the U.S. government. They settled on a reservation in Nebraska. At the end of the 20th century there were more than 4,000 Omaha.

An Omaha man shows the traditional Omaha style of clothing.

Oman

The country of Oman is an Arab sultanate, or monarchy, in the Middle East. The capital is Muscat.

Geography

Oman is on the Arabian Peninsula. It borders Yemen, Saudi Arabia, and the United Arab Emirates. The Arabian Sea lies to the east, and the Gulf of Oman lies to the north. A small part of Oman sits north of the United Arab Emirates.

Oman is hot and dry. A rocky desert covers most of the country. The northeast and southwest are the only humid areas. Mountains rise near the coasts. There are no rivers or lakes.

Plants and Animals

Few plants besides acacia trees grow in the dry regions. Tropical plants grow in the humid southwest. Oman's rare animals include Arabian oryx (a type of antelope) and Arabian leopards.

Houses are close to the water in a town in Oman.

People

Most of the people of Oman are Arabs. Arabic is the main language. Islam is the national religion.

Economy

Oman's economy depends on the sale of oil and natural gas to other countries. Oman also produces metals, cement, chemicals, and food products. The country's few crops include dates, bananas, and watermelons. Livestock includes cattle, goats, sheep, and camels. Fishing is another source of food.

History

Arabs first moved to Oman in the 800s BC. Sultans, or kings, began to rule the coastal areas in AD 1154. Omanis later used the sea to trade with countries as far away as China. The Al Bu Sa'id family took power in the mid-1700s. In the early 21st century a sultan from the family still ruled Oman.

Oneida

The Oneida were the smallest of the five original Native American tribes of the Iroquois Confederacy. The confederacy was an alliance of tribes that lived in upper New York State and spoke similar languages. The Oneida traditionally lived east of what is now the city of Syracuse.

The Oneida lived in longhouses. Longhouses were large homes made of a wooden frame covered with bark. A longhouse could house as many as 30 people. The Oneida got most of their food by farming. They grew corn, beans, and squash. They also hunted deer and other animals.

The Oneida knew only other Native Americans until the early 1600s. At that time French explorers and traders came to their lands. The Europeans brought smallpox and other diseases that killed many Oneida.

During the American Revolution (1775–83), the Oneida served as guides and scouts for the American forces. After the war the Oneida signed a treaty with the American government. The treaty gave the Oneida rights to their homeland in New York. However, settlers ignored the treaty and took the land.

In the 1820s many Oneida moved to what is now Wisconsin. Others moved to Ontario, Canada. In the early 21st century there were more than 18,000 Oneida. About two thirds of them lived

Onion

The onion is a plant bulb made up of crisp, fleshy layers. Valued for its flavor, it may be cooked or eaten raw. The onion is an herb that belongs to the lily family. It is related to garlic, leeks, and chives. Its scientific name is *Allium cepa*.

Onions are grown in mild climates around the world. The plants have long, hollow leaves that look like stalks. The bulb forms at the bottom of the stalks, just under the soil. Onion bulbs vary in size, shape, color, and flavor. They range from less than 1 inch (2.5 centimeters) to more than 4.5 inches (11 centimeters) across. They are typically round or a little flattened. They may be white, yellow, or red.

Onions contain an oil that is rich in the mineral sulfur. This oil is released into

Onondaga

The Onondaga are a Native American people of New York State. They live near Onondaga Lake in central New York. The Onondaga were one of the five original tribes of the Iroquois Confederacy. The confederacy was an alliance of tribes who lived in the same area and spoke similar languages.

Like the other Iroquois, the Onondaga traditionally lived in longhouses. Longhouses were homes built from wood and bark. A longhouse was large enough to house several families. A village had about 20 to 50 longhouses. The Onondaga grew corn, beans, squash, sunflowers, and tobacco. They also hunted deer and other animals.

In the 1600s French traders arrived in Onondaga territory. During the French and Indian War (1754–63) the Onondaga helped the French fight against the British. During the American Revolution (1775–83) American troops attacked Onondaga villages. Then the tribe helped the British fight the Americans.

After the British lost the American Revolution, some Onondaga moved to Canada. Those who stayed behind had to give up most of their land. The Onondaga were left with only a small reservation near what is now the city of Syracuse, New York.

At the end of the 20th century there were about 3,000 Onondaga. About 2,000 lived in the United States, and about 1,000 lived in Canada.

An illustration shows the French attacking an Onondaga village in the early 1600s. The Onondaga built walls around some of their villages for protection.

Ontario

Ontario is the most populated province in Canada. A Native American word describing Lake Ontario likely gave the province its name. Ottawa, the capital of Canada, is in Ontario. The province's own capital is Toronto.

Geography

Ontario lies between the provinces of Quebec to the east and Manitoba to the west. Ontario is Canada's second largest province after Quebec.

The waters of Hudson Bay and James Bay lap Ontario's northern edge. The Great Lakes and the Saint Lawrence River form its southern boundary. Within Ontario, about 250,000 lakes and countless rivers and streams contain about one third of Earth's freshwater. The famous Niagara Falls lie on the border between Ontario and the United States.

Ontario is fairly flat. Swamps, meadows, and forests dot the northern parts of Ontario. Rich soils cover the southern areas of the province.

People

Many of Ontario's people have ancestors who came from Great Britain. Later immigrants came from other parts of Europe. A small population of black people have ancestors from the United States or the West Indies. There are also people with Asian or American Indian ancestry.

About 80 percent of Ontario's people live in or around its cities. Most of them live in southeastern Ontario, where Toronto, Ottawa, Hamilton, and Windsor are located. Toronto is the largest city in Ontario and the largest city in Canada. It is the center of Canada's business and cultural activities.

Economy

Ontario has a strong economy. Most people in Ontario work in financial, technical, and cultural services. Other important industries are car manufacturing, food processing, wood and paper products, and electronic products. The province's mines produce copper, zinc, gold, nickel, silver, platinum, and palla-

Skaters glide across the ice at an outdoor skating rink in Toronto. Toronto is the capital and largest city of Ontario, Canada.

dium. Ontario also has a large lumber industry in the north.

Most of the best farmland in Canada lies in Ontario, especially in the south. Farmers grow soybeans, corn, wheat, barley, and vegetables. They also raise poultry, hogs, and cattle. Apples are the leading fruit crop.

History

People have lived in what is now Ontario for at least 10,000 years. Among the early people were Indian hunters and fishers, including some Algonquian peoples, the Cree, and the Ojibwa in the north. Farming peoples in the south included the Wyandot (Huron), the Tionontati, the Attiwardon, and some Iroquois.

Europeans first explored the area in the early 1600s. Étienne Brûlé and Samuel de Champlain of France explored what are now the Ottawa River and Lake Ontario. Henry Hudson of England

explored what is now Hudson Bay in the north. In the late 1600s France built a fur trade in the region.

For more than a century France and Great Britain fought for control of territories in North America. In 1763 France lost its territories, including what is now Ontario, to Great Britain.

During and after the American Revolution many people moved north to what is now Ontario. Those people supported Great Britain, not the new United States. They also disagreed with the French-speaking settlers to the east.

In 1791 Great Britain divided its North American territory into Lower Canada and Upper Canada. Lower Canada, made up of mostly French speakers, later became Quebec. Upper Canada, made up of mostly English speakers, later became Ontario.

In 1867 Great Britain united its North American land to form the new country of Canada. The new Canadian government made Ontario a province. People flooded into Ontario from all parts of the world. During the 1950s alone, more than 100,000 people a year settled in Ontario.

Ontario, Lake

Lake Ontario is the smallest of the five Great Lakes of North America. It is also the farthest east. Lake Ontario forms part of the boundary between the United States and Canada. It is bordered on the north by the Canadian province of Ontario. The U.S. state of New York is to the south.

Lake Ontario covers 7,550 square miles (19,554 square kilometers). Its main source is the Niagara River. The Niagara River is the natural link between Lake Ontario and Lake Erie to the southwest.

The man-made Welland Canal also connects Lakes Ontario and Erie. It allows ships to avoid Niagara Falls. In the east Lake Ontario empties into the Saint Lawrence River.

The land north of Lake Ontario is good for farming. There are many industries in and around the cities of Toronto and Hamilton in Ontario and Rochester in New York. Shipping traffic is heavy because Lake Ontario is part of the Saint Lawrence Seaway. This system allows ships to travel between Great Lakes ports and the Atlantic Ocean.

Opera

Opera is a type of classical music. It is also a mix of several art forms. Like actors in the theater, opera singers act out a story on a stage. An orchestra plays the music. Opera often features ballet or other types of dance, too.

Most or all of the words in an opera are sung. When one person sings it is called a solo. A solo may be a complicated song, called an aria. Or a solo may be a simpler kind of sung speech. Small groups of singers or a large group called the chorus may sing other songs.

Did You Know?

Musical comedy, like opera, combines music with theater. Musical comedies of the 20th century include *The Sound of Music* and *Cats*.

People relax on a beach on the shore of Lake Ontario.

Opera singers perform in *The Barber of Seville*, an opera written by Gioacchino Rossini in the early 1800s.

Opera was invented in Italy in the late 1500s. The first opera was Jacopo Peri's *Dafne*. It was performed in 1597–98. This new musical style became popular throughout Europe.

Many famous operas were written in the 1700s and 1800s. Wolfgang Amadeus Mozart was an important opera composer, or writer, during the 1700s. One of his opera masterpieces is *The Marriage of Figaro*, which he wrote in 1786. Giuseppe Verdi was a great Italian opera composer of the 1800s. In the late 1800s German composer Richard Wagner wrote a series of four operas based on German legends. This famous series is called *The Ring of the Nibelung*.

In the 1900s opera grew and changed, as did the classical music of the time. Italian composer Giacomo Puccini created some of the most popular operas of the early 1900s. In the late 20th and early 21st centuries people continued to perform and enjoy many of the old opera

masterpieces. Composers also created new operas.

Opossum

Opossums are marsupials, or animals that carry their young in a pouch. They are sometimes called possums. Most opossums live in forests of Central and South America. The Virginia, or common, opossum is the only marsupial found in North America.

An opossum has a pointy snout, a pink nose, and beady black eyes. Some opossums are only about 6 inches (15 centimeters) long. Others are about the size of a house cat. A hairless tail makes up about half of the animal's length. Opossums have coarse fur that can be grayish white or nearly black.

Opossums often make their homes in hollow trees or under stumps and roots.

An opossum pretends to be dead to protect itself from predators.

They come out at night to eat whatever they can find, including insects, rodents, berries, rotting fruit, and even dog food.

A female opossum can give birth to as many as 25 babies. The babies spend four to five weeks in their mother's pouch. Then they spend eight or nine weeks clinging to the mother's back.

Opossums have a unique way of escaping enemies. Most predators like to eat live food and will lose interest in animals that are already dead. So an opossum sometimes pretends to be dead when an enemy is near. It freezes like a statue and then falls over. When the predator loses interest and leaves, the opossum gets up and walks away. This trick has become known as "playing possum."

Optics

Optics is the study of light. Optics describes how light is created and how it travels. An important part of optics is the study of what happens when light hits different surfaces. When light hits a surface, it may be reflected, refracted, or absorbed.

Reflection occurs when light hits a surface and bounces back. Reflected light makes images appear in mirrors and in other smooth, shiny surfaces.

Refraction happens when light changes direction, or bends, when it moves from one material to another. For example,

Refraction causes straws to appear bent at the surface of water.

light traveling through the air refracts when it hits water. This can make a straw in a glass of water look bent at the surface of the water.

Some surfaces neither reflect nor refract light. They absorb, or take in, light. This causes the surface to heat up. For example, a sidewalk heats up on a hot, sunny day because it is absorbing light.

Mirrors and lenses are important tools in optics because they reflect and refract light. Eyeglasses, magnifying glasses, telescopes, and binoculars all have lenses or mirrors. They change the way people see things by controlling how light enters the eye.

Orange

Oranges are citrus fruits with fragrant, leathery skin and juicy flesh. The most common types are the sweet (or com-

The leathery skin of navel oranges protects the juicy flesh inside.

mon) orange, the sour (or Seville) orange, and the mandarin orange. The sweet orange is the most widely grown citrus fruit in the world.

Orange trees originally grew in the tropical regions of southeastern Asia. Today people grow them in most warm areas of the world.

Most sweet orange trees are about 20 feet (6 meters) tall. They have glossy, green leaves and small white flowers.

The size, shape, and color of orange fruits vary somewhat depending on the type. The fruits are generally round and about 2 to 4 inches (5 to 10 centimeters) across. The peel is commonly orange or greenish yellow. It is dotted with oily glands that give the fruit a strong fragrance.

Oranges are rich in vitamin C. People peel and eat oranges raw. They also use them in sauces, marmalades, and other

foods. Orange juice is sold fresh or frozen. People use orange oil as a flavoring or as a fragrance.

Orangutan

The orangutan is the largest animal that spends most of its time in trees. It is a reddish ape related to gorillas, chimpanzees, and bonobos. All these animals are called great apes because of their large size and great intelligence. Orangutans and other great apes belong to the larger group of mammals called the primates. The primates also include other apes, monkeys, and humans.

Orangutans are the only great apes of Asia. They are found only in certain jungles on the islands of Borneo and Sumatra in Indonesia. In the past they also lived in mainland Southeast Asia.

A male orangutan looks down from the branches of a tree.

They are no longer as widespread because people have hunted them and destroyed their habitats. Orangutans are endangered, or at risk of dying out completely in the wild.

Orangutans have a short, thick body with shaggy red or orange hair. They have long, powerful arms and short legs. Adult male orangutans are about twice the size of the females. The adult males are almost 4.5 feet (1.4 meters) tall. They may weigh as much as 285 pounds (130 kilograms).

Orangutans eat a great variety of foods, including fruit, leaves, bark, and insects. Unlike almost all other apes and monkeys, adult orangutans tend to live alone. They use their hands and feet to

climb and walk along tree branches. The adult males sometimes have to walk on the ground to travel long distances. This is because smaller tree branches cannot support their weight.

Orchestra

An orchestra is an assembly of musicians that performs musical works written for a group. In Western countries an orchestra usually includes stringed instruments, such as violins, cellos, and violas; woodwind instruments, such as flutes, oboes, and bassoons; brass instruments, such as trumpets, trombones, and tubas; and percussion instruments, such as

A chart shows where the players sit in a large modern orchestra: strings in front, woodwinds behind them, brass behind the woodwinds, and percussion in back.

drums, gongs, and the xylophone. But an orchestra can include whatever instruments are needed to perform a musical work.

In the early days of classical music different types of instruments were generally not played together. In about the 1600s European composers began experimenting with mixing the different sounds each type of instrument produces.

The modern orchestra developed in the 1700s in Germany, where the four basic instrument sections were established. Some individual instruments, such as the harpsichord and the lute, were phased out. Others, such as the clarinet and the piano, were sometimes added. Orchestras grew much larger during the 1800s, with some works calling for well over 100 musicians. In the early 1900s a smaller orchestra, called a chamber orchestra, was developed. A chamber orchestra has about two to eight members and usually focuses on stringed instruments and piano.

Orchid

Orchids are plants prized for their beautiful and unique flowers. Orchids make up one of the world's largest plant families, with between 15,000 and 35,000 species, or types. Many people grow orchids as a hobby.

Orchids grow in most parts of the world except for the areas near the North and

South poles. Most orchids prefer warm, tropical areas. Orchids can grow in soil, completely underground, or on other plants or rocks. The species that grow on other plants or rocks get moisture and nutrients from rainwater, rotting plant matter, or the air.

Orchid plants can measure from less than an inch (2.5 centimeters) to more than 15 feet (4.6 meters) tall. There can be a single flower or clusters. The flowers can be as small as 0.1 inch (2.5 millimeters) or as large as 15 inches (38 centimeters) across. They can be almost any color, and some have spots or streaks. Many orchids have a strong fragrance, or smell, but some have no fragrance at all.

The flavoring known as vanilla comes from the seedpods of some orchid plants. It is used in baked goods and beverages, and it is an ingredient in perfumes as well.

The violin player who sits in front is called the concertmaster. This person helps the conductor lead the orchestra.

Oregon

A hiker stops to enjoy Elowah Falls in Oregon's Mount Hood National Forest.

The state of Oregon is at the heart of the Pacific Northwest region of the United States. Oregon's countryside is filled with beautiful scenery. It has seaside beaches, mountain ranges, canyons, and waterfalls. Oregon is nicknamed the Beaver State. During the region's early history, the beaver's valuable fur was the area's most important trade good. Salem is the state capital.

Geography

Oregon is bordered by Washington to the north and the Pacific Ocean to the west. California and Nevada are to the south. Idaho is to the east. The Columbia River serves as most of Oregon's northern boundary. The Snake River marks part of the eastern boundary.

The Cascade Mountains are located in west-central Oregon. The mountains divide the state into two geographical

sections, west and east. To the west of the Cascades are rain forests, mountains, and lush valleys. Mount Hood is located in the Cascades. It is the state's highest peak at 11,239 feet (3,428 meters). East of the Cascades the land is drier. This section includes plateaus, deserts, and mountains. The Blue and Wallowa mountains are in the northeast.

People

The population of Oregon increased by more than one fifth between 1990 and 2000. This rate of growth was much higher than in most other states in the nation. Whites of European descent represent more than four fifths of the population. Hispanics are the largest minority group. They make up about 8 percent of the state's population.

Most of Oregon's people live west of the Cascade Mountains in the Willamette River valley. The state's three largest

cities—Portland, Eugene, and Salem—are located in this area.

Economy

Oregon's economy has traditionally been dependent on natural resources such as forest products. Harvesting trees for lumber and plywood remains an important industry. In the late 1900s, however, high-technology and service industries became increasingly important. The production of computer and electronic equipment became a major manufacturing industry. The state also produces clothing and other textiles. Tourism is an important service industry in Oregon. It provides jobs in hotels and restaurants.

Greenhouse and nursery plants, cattle, and milk and cheese are leading agricultural products. Oregon's fisheries catch seafood products such as salmon, tuna, and crab.

History

Many Native American tribes lived in the Oregon region before the arrival of white settlers. Among them were the Chinook, the Nez Percé, and the Klamath peoples.

In 1579 the English explorer Francis Drake claimed the region for his country. The land remained unexplored for two centuries, however. In 1792 Boston merchants made the first United States claim to the Pacific Northwest. The explorers Lewis and Clark reached the mouth of the Columbia River in 1805.

Portland is the largest city in the U.S. state of Oregon. It is located in the scenic northwestern corner of the state.

The first white settlers were fur trappers and traders who arrived in the early 1800s. In the mid-1800s, settlers from every state traveled to the area along the famous Oregon Trail. At the time both the United States and Great Britain claimed the land that is now Oregon and Washington. The two countries finally settled their boundary dispute in 1846, and the United States soon created the Oregon Territory. In 1853 Washington Territory separated from Oregon, and in 1859 Oregon became the 33rd state.

By the early 1880s railroad lines reached Oregon. The railroads linked Oregon with the rest of the United States. During the 1900s Oregon's cities grew rapidly. Many people were drawn by the environment to move there from other states. The state passed several laws in the late 1900s to protect the environment.

Oregon Trail

In the middle years of the 1800s many thousands of U.S. pioneers traveled west on the Oregon Trail. The trail ran from Independence, Missouri, to what is now northern Oregon, near the Columbia River. It was about 2,000 miles (3,200 kilometers) long. The Oregon Trail was one of two main routes to the Far West. The other was the Santa Fe Trail, which led to New Mexico.

Unlike a modern highway, the Oregon Trail was not a single clear path. In places it was 10 miles (16 kilometers) wide. There were also many shortcuts and side paths. Some people who used the trail were bound for Utah or California, not Oregon.

Pioneers traveled the Oregon Trail in covered wagons pulled by horses, mules,

or oxen. The trip to Oregon took about four to six months. The pioneers brought some food with them and also hunted along the trail. They got water from rivers.

The Oregon Trail followed paths that had already been discovered. Between 1804 and 1806 the explorers Meriwether Lewis and William Clark traveled from Missouri to Oregon and back. Fur traders and missionaries later found other paths that became part of the trail. Wagon trains carrying hundreds of pioneers first used the trail in the early 1840s. In the 1860s railroads began replacing much of the travel by wagon train. However, people still used the trail until 1880.

Organization of American States

Twenty-one countries in North America, Central America, and South America formed the Organization of American States (OAS) in 1948. The countries had several goals. One goal was to bring order and justice to all the member countries. Another goal was to protect the member countries. A third goal was to maintain each country's independence.

Today the OAS has 35 member countries. The countries work together in several different bodies, or groups. The General Assembly is the most important body of the OAS. It meets once a year to make decisions about the OAS's plans and actions. Each country has one vote in the General Assembly.

The OAS works to support democracy. Members promote democratic governments throughout the Western Hemisphere. For example, the OAS has watched over elections in member countries to make sure that they are fair.

The OAS also supports human rights. Many of its programs and services help people to be treated well.

In the early 21st century the OAS focused on fighting terrorism. It also encouraged trade among member countries.

Organization of the Petroleum Exporting Countries

The members of the Organization of the Petroleum Exporting Countries (OPEC) are countries that produce more petroleum (oil) than they need. OPEC tells these countries how much oil to export, or ship to other countries. It also tells them how much money to charge for the oil. OPEC's head office is in Vienna, Austria.

Oil is used to make gasoline and other fuels. Many countries produce no oil. Others, including the United States, produce less oil than they use.

In 1960 the oil-rich countries of Iran, Iraq, Kuwait, Saudi Arabia, and Venezuela created OPEC. They wanted to gain greater control over oil prices. Qatar,

A news conference gives OPEC representatives a chance to explain their actions.

Did You Know?

The OAS protects the rights of women and children. It also works to improve people's health and education.

Indonesia, Libya, the United Arab Emirates, Algeria, Nigeria, and Angola joined OPEC later.

OPEC's Growing Power

In 1973 the Arab members of OPEC became angry because the United States and some European countries were supporting Israel in the Arab-Israeli wars. As punishment, OPEC began raising the price of oil. For a time OPEC also stopped shipping oil to the United States.

As oil prices rose, OPEC countries became wealthy. The countries that depended on OPEC's oil had economic problems caused by the high prices. Gradually these countries looked for other sources of oil and for other forms of energy so they would not need to buy as much oil. As a result, OPEC's power was reduced. However, OPEC countries still controlled about two thirds of the world's oil supplies.

Orpheus and Eurydice

In ancient Greek and Roman mythology Orpheus was a hero and outstanding musician. Eurydice was his wife. Several books, movies, and musical pieces have been written about their tragic love story.

According to legend, Orpheus' mother was a Muse. The Muses were goddesses who inspired musicians and artists.

The story of Orpheus and Eurydice was a tragic love story. Orpheus failed to bring Eurydice back from the land of the dead.

Orpheus sang and played a stringed instrument called a lyre. No one could resist Orpheus' music. Even the animals and trees moved around him in dance.

Osceola

Osceola was born in Georgia in about 1804. His mother belonged to the Native American group called the Creek. His father may have been a white trader.

When Osceola was a boy, the U.S. government forced many Creek out of Alabama and Georgia. Osceola's family moved to northern Florida. They joined the Seminole.

Osceola first attracted attention by speaking out against the Treaty of Payne's Landing. This was an agreement that called for the Seminole to be moved to Indian Territory (now Oklahoma).

Osceola went to prison for fighting against the move. He was released after pretending to change his mind. He then organized a fighting force. The warriors killed the U.S. official who had jailed Osceola. They also killed the Seminole chief who had signed the treaty. These attacks sparked the Second Seminole War in 1835.

Osceola's warriors killed as many as 2,000 U.S. soldiers. Osceola himself was slightly wounded.

In 1837 Osceola agreed to meet with U.S. officials. They seized him during peace talks. The public was outraged. Osceola was put in a South Carolina prison. He died there on January 30, 1838. The Seminole continued fighting until 1842. Then most of them moved to Oklahoma.

Oslo

Population
(2008
estimate), city,
560,484; urban
area, 856,915

Oslo is the capital of Norway, a country in northern Europe. It is Norway's largest city and busiest seaport. Most of the country's major museums, theaters, and other cultural centers are in Oslo.

Most people in Oslo work for the government or businesses that provide services. Oslo is Norway's center of trade, banking, industry, and shipping. Ship-

building and engineering also are leading industries in the city. Many companies in Oslo are involved in high technology, communications, medicine, research, and energy.

People settled in the Oslo area in about 1000. King Harald III Sigurdsson of Norway founded a town there in about 1050. In 1624 a fire completely destroyed Oslo.

King Christian IV, who ruled Denmark and Norway, then built a new town across the river. The new town was named Christiania. It became the capital of Norway in 1814. During the 1800s Christiania grew rapidly and became Norway's largest city. In 1925 the city was renamed Oslo.

Ostrich

The ostrich is the largest living bird. Its scientific name is *Struthio camelus*.

Unlike most other birds, the ostrich cannot fly. But it can run very fast. An ostrich can run at a speed of 45 miles (72 kilometers) per hour.

In the wild ostriches are found in the countryside in parts of Africa. Some people also raise ostriches for the birds' meat, eggs, and hides.

Ostriches are tall birds. The males may reach a height of 8 feet (2.4 meters) or more. The females are somewhat smaller.

Male ostriches have black and white feathers.

Male ostriches are mostly black, with white feathers on the wings and tail. The females are mostly brown. An ostrich's head and neck are lightly covered with short feathers. The legs are strong and do not have any feathers. Each leg ends in two toes.

Ostriches use their short, wide bills to graze on grasses and other plants. They sometimes eat insects, too.

The eggs of ostriches are the largest eggs in the world. They average about 6 inches (15 centimeters) in length and 5 inches (13 centimeters) across.

Ottoman Empire

The Ottoman Empire began in what is now Turkey in about 1300. Eventually, it grew to cover much of the Middle East, southeastern Europe, and North Africa. During the 1400s and 1500s the Ottoman Empire was one of the world's great powers. In the 1900s the remains of the empire became the Republic of Turkey.

Growth of the Empire

The empire was named after its founder, Osman I. Osman was born in 1258 in Anatolia, or Asia Minor (modern Turkey). His people were the Turks, who were Muslims (followers of Islam). Osman led the Turks against the Byzantines, who were Christians. He and the leaders who followed him took over many Byzantine territories.

In 1453 the Ottomans captured Constantinople, the capital of the Byzantine Empire. They renamed the city Istanbul and made it their own capital.

In 1517 the Ottomans took control of Mecca and Medina, the holiest cities of Islam. After that, the Ottoman ruler, or sultan, was seen as the leader of Islam. Süleyman I, the sultan from 1520 to 1566, expanded the empire further. During his reign, the Ottoman Empire stretched from Hungary to the Persian

The Ottoman Empire once controlled lands in Europe, Africa, and Asia.

Gulf. Its lands also included Egypt and the coast of North Africa.

End of the Empire

The Ottoman Empire began to lose power in the late 1500s. Economic problems led to unrest among people ruled by the empire. In 1683 the Ottomans failed in an attempt to capture the city of Vienna in Austria. This battle led to a century of wars with European leaders. The Ottomans lost a great deal of territory as a result.

In World War I (1914–18) the empire fought with Germany on the losing side. This defeat caused the empire to fall apart completely. In 1923 a group of young Turks formed the new country of Turkey.

Oviraptor

When scientists discovered *Oviraptor* it appeared to be lying on top of the eggs of another dinosaur. They named the dinosaur *Oviraptor*, which means “egg thief.”

When and Where *Oviraptor* Lived

Oviraptor lived 99 to 65 million years ago. Remains of *Oviraptor* have been

found mainly in Asia, but some also have been found in North America.

Physical Features

Oviraptor grew to a length of about 6 feet (1.8 meters) and stood about 3 feet (0.9 meter) tall. It weighed about 70 pounds (32 kilograms). The dinosaur had a razor-sharp beak instead of teeth. Its head was short and deep and looked like the head of a parrot. It stood and walked on its two slender back legs. Its front legs were shorter than the back legs. *Oviraptor* had a long tail, which may have helped it to balance.

Behavior

Scientists found the first *Oviraptor* skeleton in the nest of what they believed was a horned dinosaur. They assumed that it fed on eggs stolen from the nest. Later discoveries made scientists believe that *Oviraptor* was trying to hatch its own eggs.

Oviraptor was much larger than a modern chicken.

Owens, Jesse

Jesse Owens runs in the 1936 Olympic Games.

African American track-and-field athlete Jesse Owens won four gold medals at the 1936 Olympic Games. His achievements were important for himself and for many other people at the time. The Games were held in Berlin, Germany. Nazi leader Adolf Hitler was in power there. The Nazis believed white athletes were best. But Owens proved that they were wrong.

James Cleveland Owens was born in Oakville, Alabama, on September 12, 1913. His family later moved to Cleveland, Ohio, in search of better opportunities. In school James, or J.C., became known as Jesse.

Jesse became a track star at a young age. In 1928 he set track records in the high jump and the running broad jump (long jump). In 1933, while he was in high

school, he broke three other records. He then went to Ohio State University.

In the Olympics Owens won gold medals for the running broad jump, the 100- and 200-meter races, and the 4 × 100-meter team relay. He also set new Olympic and world records.

Owens graduated from college in 1937 and worked for the Illinois Athletic Commission. He later got involved in guidance activities for young boys. He also made goodwill visits to countries in Asia for the U.S. government. Owens died from cancer in Phoenix, Arizona, on March 31, 1980.

Owl

Owls are birds of prey, meaning that they hunt and eat animals. Unlike most other birds of prey, owls are nocturnal, or active

Like all owls, the common barn owl has large eyes, a hooked beak, and sharp claws.

at night. Common types of owl include barn owls and the short-eared owl.

Owls live around the world in almost every kind of habitat. Their length varies from about 5 to 28 inches (13 to 71 centimeters). Most owls have brown, gray, or white feathers with streaks or spots.

All owls look about the same. Each owl has a large head, a flat face, a hooked beak, and large eyes. It also has a short tail, long wings, and sharp claws. Owls have excellent eyesight and hearing. An owl cannot move its eyes much. But it can turn its head far around to look directly backward.

Most owls eat small animals such as mice, voles, and rabbits. Some owls eat insects, birds, or other animals.

Owls make a variety of sounds. An owl may snap its bill, clap its wings in flight, or sing. Its song may be anything from deep hoots to chirps or whistles.

Bird • Bird of Prey

Did You Know?

Most owls swallow their prey whole. They later spit up the bones, fur, and feathers that they cannot digest.

Images from satellites high above Earth show the hole in the ozone layer over Antarctica.

differs from common oxygen in its chemical makeup. Each molecule of common oxygen has two atoms. Each ozone molecule has three atoms.

Ozone is a natural part of Earth's upper atmosphere. This part of the atmosphere, about 15 miles (24 kilometers) above the surface, is called the ozone layer. It protects people by absorbing harmful rays from the sun. If they reach Earth, these rays can cause skin cancer, eye diseases, and other health problems. Some chemicals used in industry can destroy this protective ozone. Scientists have found a "hole" in the ozone layer over Antarctica.

Though ozone is helpful high above Earth, it is a form of air pollution near Earth's surface. Even very small amounts can irritate people's eyes and cause coughing. Automobile exhaust combined with sunlight can increase the amount of ozone in the air.

Pacific Ocean

The Pacific is the largest of Earth's oceans. It covers more of Earth's surface than all the dry land put together. The explorer Ferdinand Magellan named the ocean *El Mar pacífico*, which means "the peaceful sea."

Physical Features

The Pacific Ocean extends to North America and South America to the east. Asia and Australia lie to the west. From north to south, the Pacific extends from the Arctic Ocean to the broad coast of

Many islands in the Pacific Ocean were formed from the stony skeletons of countless coral animals.

Antarctica. It covers about 63,800,000 square miles (165,250,000 square kilometers) in area.

The deepest point in the Pacific—or anywhere on Earth—is the Mariana Trench, near the Mariana Islands. At 36,201 feet (11,034 meters), it is much deeper than Earth's highest mountain, Mount Everest, is high.

Under most of the Pacific Ocean lies the enormous Pacific Plate. A plate is a rigid section of Earth's crust that moves slowly in relation to other plates. Several of these other plates surround the Pacific Plate. Many volcanoes and earthquakes occur where these plates meet. The chain of volcanoes around the edges of the Pacific is called the ring of fire.

Many large islands lie in the western Pacific. These include the island groups of Japan, the Philippines, Indonesia, and New Zealand. Smaller islands are scattered over a large area of the central and western Pacific, called Oceania. Volcanoes formed some of these islands, like Hawaii. Other islands are made of coral.

Currents and Climate

Winds drive the water near the ocean's surface into patterns called currents. In the North Pacific, the main current moves in a clockwise direction. The main current in the South Pacific runs counterclockwise. This means that in the extreme north and south, most winds and currents run eastward, while near the equator they run westward. Ocean winds and currents affect climate on land. For example, the Kuroshio, or

Japan Current, carries warm weather north to Japan and then east to the Pacific coast of Alaska and Canada.

Heat and water vapor (gas) sometimes combine to create large, circular storms with destructive winds and drenching rainfall. This type of storm is known as a typhoon. Typhoons are similar to hurricanes, which form in the Atlantic Ocean. Typhoons are most common in warm areas of the western Pacific.

Economy

Container ships carry goods across the Pacific Ocean between Asia and North American ports, such as Seattle, Washington.

The Pacific Ocean has abundant mineral resources. People take salt, bromine, and magnesium from the water. They take sand, gravel, and phosphate rock from the seabed. The ocean also has a rich variety of fish and other marine life. In addition, many ships on the Pacific carry goods between countries.

Exploration

People from Southeast Asia settled the islands of the Pacific over a long period starting about 3,000 to 4,000 years ago. The first known Europeans to see the Pacific Ocean were Spanish explorers led by Vasco Núñez de Balboa. Balboa saw the ocean from what is now Panama in 1513. The navigator Ferdinand Magellan entered the Pacific Ocean from the south in 1520. Dutch, French, and British explorers followed the Spanish. Captain James Cook of Great Britain explored the islands of the South Pacific in the 1700s. After he died in 1779, there were few islands that remained to be discovered by the outside world.

Environmental Issues

People have polluted some parts of the Pacific, especially near the shores of big cities and ports. Large amounts of factory waste, sewage, fertilizers, and pesticides have found their way into the ocean. Oil spills from ships have caused major problems in coastal areas. In addition, overfishing in the Pacific has greatly reduced the numbers of some types of fish and other sea animals.

Paige, Satchel

Satchel Paige was an outstanding U.S. baseball player. He was a pitcher known for the speed and control of his fastball.

Did You Know?

A Pacific Ocean current called El Niño can cause storms in California, droughts in Australia, and other unusual weather.

Satchel Paige

Leroy Robert Paige was born in Mobile, Alabama, probably on July 7, 1906. As a child he earned money by carrying satchels, or bags, for people at the railroad station. This might be how he got the nickname Satchel. Paige became a good pitcher of fastballs while he was in school.

Paige spent most of his professional baseball career in the Negro leagues. He and other African Americans could not play in the major leagues at the time. Paige entered the Negro leagues in 1926. He played for a number of teams, including the Birmingham Black Barons, the Pittsburgh Crawfords, and the Kansas City Monarchs.

Paige was finally allowed into the major leagues in 1948. At about 42 years old, he was the oldest rookie ever in the major leagues. Paige helped the Cleveland Indians win the World Series that year. Paige later pitched for the Saint Louis Browns.

Paige retired after the 1953 season. He had played for almost 30 years. He might have won as many as 2,000 games. Paige was elected to the Baseball Hall of Fame in 1971. He died on June 8, 1982.

Paine, Thomas

Thomas Paine was an important writer and thinker during the American Revolution. His powerful words moved many American colonists to join the fight against British rule.

Paine was born in Thetford, England, on January 29, 1737. At age 13 he left school to work for his father. As he grew up Paine moved from job to job.

Common Sense by Thomas Paine used plain language to convince American colonists to demand independence from Great Britain.

Paine never did well in England. When he was in his 30s he met Benjamin Franklin in London. Franklin encouraged Paine to move to America.

In 1774 Paine moved to the American colonies. With Franklin's help Paine began publishing his opinions in articles and pamphlets.

One of Paine's most famous pamphlets was *Common Sense*, published in 1776. *Common Sense* urged the colonies to declare independence from Great Britain. Paine's simple but strong message moved many people to action.

After the American Revolution Paine wrote against the rich. He recommended ways to help the poor. He refused to take money for his writing and fell into poverty.

In his later years Paine wrote against organized religion. This angered people in Britain and the United States. He became an outcast and suffered poor health. Paine died on June 8, 1809, in New York City.

Painting

The art of creating pictures using colors, tones, shapes, lines, and textures is called painting. Museums and galleries show the paintings of professional artists. But painting is also a popular form of entertainment and creative expression.

A young painter uses paint, a brush, and her imagination to fill up a blank sheet.

People of all ages create pictures using a variety of materials. Experienced painters usually use a brush to apply oil paints or acrylic paints to a canvas cloth surface. Young painters usually use watercolors on sheets of paper. Very young children may use finger paints to create paintings.

Subjects

Painters can use their art to express devotion to a religion, to tell a story, to express feelings and ideas, or simply to present a pleasing image. Religious paintings often portray a god or a scene from a sacred text. Other common subjects have been famous legends and events in history, as well as scenes from daily life. Artists also paint portraits, or pictures of people. Sometimes artists make portraits of themselves, which are called self-portraits. All of these types of paintings portray the human figure in some way.

Some kinds of painting do not focus on people. In landscape painting the focus is on scenes from nature. Artists also paint motionless objects such as fruits

and vegetables. These works are called still-life paintings. Some artists communicate their ideas through images that do not represent any specific object. These works are called abstract paintings.

Elements of Design

The design of a painting is the arrangement of its lines, shapes, colors, tones, and textures into a pattern. The combination of colors and shapes can communicate a particular mood or produce a sensation of space, volume, movement, and light. Paintings are two-dimensional because they are created on a flat surface that has length and width but not depth. Some paintings look flat. Others, though, can look three-dimensional because of the way the painter uses lines, shading, and geometric shapes.

History

Humans have been making paintings for thousands of years. Paintings dating back 15,000 years have been found on the walls of caves in France and Spain. Cave paintings generally show animals that early humans hunted. Samples of

About 14,000 years ago prehistoric artists filled the ceiling of a cave in Spain with images of bison.

A small painting of chess players decorates a manuscript that was created in Persia (now Iran) in about 1560.

painted pottery from at least 5,000 years ago have been found in China and Iran. The ancient Egyptians decorated their tombs and temples with elaborate paintings. People in ancient Greece painted decorative objects such as vases in addition to the walls of temples.

Middle Ages

In many places, including ancient Egypt, Greece, Rome, and China, artists created miniature (very small) paintings to illustrate written texts. These texts are known as illuminated manuscripts. Miniature painting was long an important art form in India and parts of the Middle East. In Europe many illustrated handwritten Bibles and other special books were made during the Middle Ages (AD 500 to 1500).

Artists in eastern Europe also started painting religious pictures on wooden

Chinese painters have often used ink instead of paint.

panels. Toward the end of the Middle Ages European painters began creating easel paintings, or smaller works created on a portable frame called an easel. Easel paintings can be moved and hung on walls.

Meanwhile the Chinese and Japanese began a long tradition of creating water-color and ink paintings on long scrolls of paper or silk. Many of the Chinese scrolls were landscapes, while the Japanese scrolls often told a story by mixing text with pictures.

Renaissance

Great developments in European art occurred during a period called the Renaissance (mid-1300s to 1500s). Renaissance artists began to paint more realistic pictures than those of the Middle Ages. To do this, they carefully

observed the world around them. They also developed many painting techniques to create the illusion of a three-dimensional world on a flat painting.

In Florence and Rome (now in Italy) artists such as Raphael, Leonardo da Vinci, and Michelangelo introduced bold ideas. Leonardo in particular experimented with ways to create more natural shades of color and light. Later the Italian painters Titian, Tintoretto, and Paolo Veronese made Venice a major center of art. The Italian Renaissance influenced many artists in other parts of Europe, including Albrecht Dürer in Germany, Pieter Brueghel in what is now Belgium, and El Greco, who created his great works in Spain.

In the 1500s the Italian Renaissance artist Titian painted a portrait of a young woman arranging her hair.

Did You Know?

The color in paint comes from substances called pigments. Pigments are ground into a powder and mixed with oils or other substances.

Baroque, Rococo, and Neoclassicism

In the 1600s a style of art known as baroque became popular in Europe. Baroque paintings use rich colors and dramatic effects of light and shade to express strong emotions. The best-known baroque painters were the Italian artist Caravaggio and the Flemish artist Peter Paul Rubens. Other great painters of the 1600s were the Spanish artist Diego Velázquez and the Dutch artists Rembrandt and Jan Vermeer.

In the 1700s French painters such as Jean-Antoine Watteau created a style known as rococo. Their paintings featured soft landscapes and decorative scenes of elegantly dressed people. Reacting against the rococo style, artists such as Jacques-Louis David created a style called neoclassicism (meaning “new classicism”) in the late 1700s. They painted scenes from the classical world (ancient Greece and Rome) with clean lines and no extra details.

Romanticism and Realism

Some artists of the 1800s wanted to express their imagination and emotions in very personal paintings. They were part of a movement called romanticism. Many of these painters also had a strong appreciation for nature. For example, the English painters John Constable and J.M.W. Turner used light and color with great freedom in their landscapes.

Other artists of the 1800s painted in a style called realism. Instead of focusing on historical themes or grand ideas, they were interested in realistically showing

everyday life and its problems. For example, the French realist painter Gustave Courbet believed that paintings should inspire social change.

Impressionism and Beyond

In the late 1800s a group of French artists tried to capture the fleeting effects of light on colors in nature. Some tried to reproduce the effect of reflected light by putting thick touches of bright, contrasting color side by side. This style of painting came to be known as impressionism. Some of the greatest impressionists were Édouard Manet, Pierre-Auguste Renoir, Camille Pissarro, Claude Monet, and Edgar Degas.

Artists known as postimpressionists carried the movement further, with their own approaches to colors, shapes, and subject matter. Georges Seurat of France developed a style in which he painted entirely by using dots of color. This style was called pointillism. The Dutch artist

The French impressionist artist Camille Pissarro tried to show how sunlight falls on objects in an orchard.

Vincent van Gogh expressed powerful emotions by using rich colors and strong brushstrokes. A French painter, Paul Gauguin, used startling color to capture nontraditional scenes, especially of the South Pacific island of Tahiti.

Modern Painting

The impressionists and postimpressionists paved the way for modern forms of painting. Many modern painters have created abstract art, which does not represent anything from the outside world. Instead of showing recognizable people, places, or objects, these paintings focus on shapes, lines, colors, and textures. The Russian-born artist Wassily Kandinsky created some of the first abstract paintings in the early 1900s.

Pablo Picasso, a major painter of the 1900s, helped create a partly abstract style of painting called cubism. In cubism forms were broken apart into simple, flat shapes. Often more than one side of a person or object was shown at the same time. For example, the side of a person's nose might show, along with the front of both eyes.

In the 1920s artists such as Salvador Dalí and Joan Miró of Spain combined images from fantasy and reality in a style called surrealism. Surrealist painters sometimes showed ordinary objects in unexpected settings—for instance, a train emerging above a fireplace.

Several important painters of the time had highly individual styles. The French artist Henri Matisse experimented with bold color and repeated patterns. The

In the 20th century Mexican artist José Clemente Orozco made colorful paintings on Mexican subjects.

Russian-born French artist Marc Chagall filled his paintings with dreamlike images in rich colors.

In the United States there had been a strong tradition of realism. Some U.S. painters of the 1900s, including Edward Hopper, Grant Wood, and Andrew Wyeth, continued in that tradition. Others, such as Georgia O'Keeffe, were influenced by newer styles. O'Keeffe is known for her partially abstract paintings of animal bones, flowers, and rocks.

In the 1940s several artists in New York City created a style of painting called abstract expressionism. Painters such as Jackson Pollock, Willem de Kooning, and Mark Rothko used new techniques to create abstract pictures that expressed their feelings or free creativity. For instance, Pollock would lay a large canvas on the floor and drip and spill paint onto it.

Two people view an abstract painting by the 20th-century Spanish artist Joan Miró.

In the 1950s a movement known as pop art began. Artists such as Roy Lichtenstein and Andy Warhol used objects from popular (or pop) culture such as soup cans, street signs, advertisements, and comic strips in their work.

Artists continued to explore new ways of painting into the 21st century. They experimented with new materials and sometimes caused controversy by portraying religious and historical subjects in startling ways.

Paiute

The Paiute are Native Americans of the western United States. The tribe is divided into two groups, the Southern Paiute and the Northern Paiute. The Southern Paiute traditionally lived in what are now Utah, Arizona, Nevada, and California. The Northern Paiute

lived in what are now Oregon, Idaho, Nevada, and California.

Most of the Paiute traditionally got their food by hunting, fishing, and gathering wild plants. They moved as the seasons changed. They stopped in places where food and water were available. While on the move the Paiute lived in wickiups. Wickiups were simple huts covered with brush.

White traders arrived on Paiute lands in the early 1800s. They offered the Paiute guns and other goods in exchange for furs. In the 1830s and 1840s many settlers traveled through Paiute territory on the way to California and Oregon. Late in the 1800s the U.S. government forced the Paiute to give up their land and move to reservations.

At the end of the 20th century there were about 10,000 Paiute. They lived mostly on or near reservation lands in Arizona, California, Nevada, Oregon, and Utah.

Pakistan

Pakistan is a Muslim country in southern Asia. It shares its early history with its neighbor India. Pakistan separated from India in 1947. Pakistan's capital is Islamabad.

Geography

Pakistan shares borders with Iran, Afghanistan, China, and India. The Arabian Sea, a part of the Indian Ocean, lies to the south. The region called Kashmir is to the northeast. Pakistan and India have long fought for control of Kashmir.

In northern Pakistan the Himalayas and the Karakoram Range include some of the highest mountains in the world. Among them is K2, the world's second tallest peak at 28,251 feet (8,611 meters). (Only Mount Everest is taller.) Western Pakistan is a very dry region of deserts, salt lakes, and a narrow plain along the coast. The Indus River flows through fertile plains in the east.

Pakistan has hot summers and cool or cold winters. It is generally very dry. Winds called monsoons bring some rain in the summer.

Plants and Animals

Some forests grow on Pakistan's mountain slopes. Grasses, dry bushes, and small trees grow in the rest of the country.

Brown bears, black Himalayan bears, wild sheep, and rare snow leopards live

in the northern mountains. The area near the mouth of the Indus River has crocodiles, pythons, and wild boars. Jackals, foxes, wildcats, and many rodents and reptiles live throughout the country.

People

The people of Pakistan are a mixture of different groups that have come to the region over thousands of years. The five major groups are the Punjabis, the Pashtuns, the Sindhis, the Balochis, and the *muhajirs*. Punjabis make up about half of the population. Their language, called Punjabi, is the most commonly spoken one.

Almost everyone in Pakistan practices Islam. When Pakistan separated from the Hindu state of India, millions of Muslims left India to settle in Pakistan. Those people and their descendants are the *muhajirs*. They speak Urdu. Urdu is

A Pakistani girl works in a cotton field.

also the language of government and education.

The majority of the people live in rural areas, but the cities have grown rapidly. Most people live in the east.

Economy

Many Pakistanis work in services, including transportation, communications, and government work. Many others work in agriculture. The main crops are wheat, rice, sugarcane, and cotton. Farmers also raise goats, sheep, cattle, and water buffalo.

Agriculture provides raw materials for some of Pakistan's most important industries. Pakistan sells cotton cloth and clothing to other countries. Workers make carpets out of wool and leather goods from hides and skins. Other industries in Pakistan make fertilizers, processed foods, and cement. The

country also mines some coal, oil, and natural gas.

History

Pakistan shares much of its early history with India. More than 4,000 years ago people in what is now Pakistan built great cities in the valley of the Indus River. The Indus Valley civilization lasted until 1700 BC. Greeks, Turks, and other peoples later invaded the region.

The Mughal Empire took power in the early AD 1500s. The Mughal rulers practiced Islam. Some of the finest mosques (Muslim houses of worship), shrines, tombs, and gardens in Pakistan were created under the Mughal Empire.

In the 1850s the government of Great Britain took over India. The Pakistan region was a part of British India until the mid-1900s.

Separation from India

In 1947 Britain divided British India into two new countries: Pakistan and India. The parts of British India that

about 2500 BC

The British government takes over India.

1858

The Muslim Mughal Empire begins.

1526

Pakistan fights India over the territory of Kashmir.

1965

Pakistan gains independence.

1947

General Pervez Musharraf takes power in Pakistan.

1999

East Pakistan wins independence as Bangladesh.

1972

had more Muslims became Pakistan. The parts with more Hindus became India. Pakistan included two regions, West and East Pakistan. They were separated by more than 1,000 miles (1,600 kilometers) of Indian territory.

After the British left, many Muslims left India for Pakistan, and many Hindus left Pakistan for India. Many Muslims and Hindus killed each other during this period.

War

Both Pakistan and India wanted the region called Kashmir. The conflict over Kashmir led to war between the countries in 1965. Pakistan and India agreed to end the war later that year, but they continued to battle over the territory from time to time.

Meanwhile, the people of East Pakistan demanded independence from West Pakistan. A civil war between the two

Pakistans began in 1971. With the help of the Indian army, East Pakistan became the independent country of Bangladesh in 1972. Pakistan's territory now included only West Pakistan.

Recent Times

The government of Pakistan changed often after independence. The military seized control of the country several times. In 1999 an army general named Pervez Musharraf took power. In 2001 Musharraf supported the United States in its war on terrorists in nearby Afghanistan. Many Pakistanis protested Musharraf's decision to help the United States. Musharraf also faced terrorist attacks within Pakistan. In 2008 he was forced to give up control of the country. A new president was elected in September of that year.

Palau

The Republic of Palau is a chain of small islands in the western Pacific Ocean. After gaining independence in 1994, Palau established a temporary capital on Koror Island. In 2006 Palau established a new capital at Melekeok on Babelthup Island.

Geography

Palau is part of the island group known as Micronesia, which is in the Pacific region called Oceania. Palau includes about 340 small islands. Babelthup is the largest island. Koror Island is much smaller, but most of the country's people live there. Raised ridges of coral called coral reefs surround the islands. Palau has a hot climate with heavy rain.

Plants and Animals

Grasslands and rain forests cover Babelthup Island. Coconut palm trees grow throughout Palau. More than 350 kinds of coral and 1,400 types of fish live in Palau's waters. The islands' colorful birds include Palau doves and Palau fantails.

Palau is made up of more than 300 small islands.

People

Most of the islanders are Palauans. Filipinos and other Asians form the next largest group. Palauan and English are the main languages. Christianity is the main religion.

Economy

Tourism and fishing are important parts of Palau's economy. Many people work for the government. Others make clothing or crafts. Small farms produce root vegetables and eggs.

History

Palau's first settlers came from Indonesia, the Philippines, New Guinea, and other Pacific islands more than 2,000 years ago. Spanish explorers arrived in 1543. In 1899 Spain sold the islands to Germany. Japan seized Palau at the start of World War I (1914–18).

The United States took Palau from Japan during World War II (1939–45). Palau became an independent country in 1994.

Paleontology

A paleontologist marks dinosaur tracks on the surface of a desert.

Paleontology is the study of plants and animals that lived millions of years ago. Scientists called paleontologists study the remains of these ancient organisms, or living things. The remains, called fossils, were preserved in rocks.

Paleontologists look for fossils all over the world. They use special tools to carefully remove fossils from the surrounding rock. They note exactly where the fossils were found. This helps them figure out how old the fossils are.

Paleontologists can learn a lot about ancient living things by studying fossils. They can find out where an organism lived and what it looked like. They can identify what an organism ate and which animals killed it for food. They can also see how ancient animals and plants are related to animals that live today.

Paleontology shows how plants, animals, and other living things evolved, or

changed over time. Fossils help scientists to build models of dinosaurs, early humans, and other early animals. Paleontology can also tell scientists about how Earth itself has changed—for example, how climates were different in the past. Scientists use this information to understand events that are happening now and what might happen in the future.

Paleontology is similar to the science called archaeology. Like paleontologists, archaeologists study life in the past. But archaeologists focus on the remains of things that early humans made, such as tools and buildings.

Archaeology • Dinosaur • Evolution
• Fossil • Prehistoric Life

Did You Know?

The word paleontology comes from the Greek words for “old” (*paleo-*), “being” (*-ont-*) and “study” (*-ology*)—meaning the study of old beings.

Palestine

Palestine is a region in the Middle East. It lies between the Jordan River and the Mediterranean Sea. Many different peoples have lived in Palestine over thousands of years. In 1948 most of Palestine became the country of Israel.

The Holy Land

Palestine is sometimes called the Holy Land. It is a sacred place for three major religions: Judaism, Christianity, and Islam. Palestine is important to Jews because the ancient kingdom of Israel was located there. It is important to Christians because Jesus lived and worked there. Palestine also has several sites that are holy to Muslims.

The boundaries of Palestine have changed through the years. When King David ruled Palestine in ancient times, its boundary was east of the Jordan River. In modern times most people think of Palestine as a smaller area. In 1947 the United Nations approved a plan to split Palestine into Jewish and Arab states, with Jerusalem in an international district. Israel was created in 1948.

Early History

Long ago Palestine was called Canaan. Tribes of people called Canaanites controlled the area for more than 1,000 years. In about 1500 BC Hebrew, or Jewish, tribes began to arrive. In about 1000 BC King David united these tribes in the kingdom of Israel. The capital of the kingdom was Jerusalem. In about 922 BC the kingdom split into two weaker

kingdoms. Both fell under the rule of more powerful neighbors.

During the time that Jesus lived, Palestine was part of the Roman Empire. By the AD 300s Christians ruled the eastern part of the empire, which included Palestine. Muslim Arabs invaded in the 600s. Muslims controlled Palestine for most of the time until the 1900s.

Modern Palestine

In 1917, during World War I, British forces took control of Palestine. Great Britain governed Palestine from the end of the war until 1948. During this period many Jews moved to Palestine from around the world. In 1948 Israel was created as a Jewish homeland.

The surrounding Arab countries did not like having a Jewish country in Palestine. They fought several wars with Israel. During the wars Israel took land from the Arabs. That land included two parts of Palestine called the West Bank and the Gaza Strip.

The Arabs who lived in Palestine before Israel was created are called Palestinians. After Israel was created, many Palestinians had to leave their homeland. Some started a movement to take back Palestine. In 1964 they formed the Palestine Liberation Organization (PLO). Palestinians sometimes attacked Israelis, who fought back. In the 1990s Israeli and Palestinian leaders began looking for a peaceful solution for sharing Palestine. However, fighting continued.

Palestine Liberation Organization

The Palestine Liberation Organization (PLO) is a political group that represents

Yasir Arafat (left) of the Palestine Liberation Organization signs a peace agreement in 1998. With him are (left to right) King Hussein of Jordan, President Bill Clinton of the United States, and Prime Minister Benjamin Netanyahu of Israel.

the Palestinian people. The Palestinians are Arabs who live in the region called Palestine, at the eastern end of the Mediterranean Sea. They lost much of their land when the country of Israel was created in 1948. Since then the Palestinians have worked for the creation of an independent Palestinian state.

The PLO was formed in 1964. It brought various Palestinian groups together in one organization. In 1969 Yasir Arafat took control of the PLO. Beginning in the late 1960s the PLO launched many attacks against Israel. Its goal was to wipe out Israel as a country.

In the 1980s some people within the PLO moved away from the goal of destroying Israel. They believed that a Palestinian state could exist alongside Israel. In 1988 the PLO's leaders declared an independent Palestinian state. They also stated that Israel had a right to exist. Some Palestinian groups disagreed. They continued to call for Israel's destruction.

In 1993 the PLO and Israel took part in secret talks in Oslo, Norway. The talks led to a series of peace agreements. For the first time, Israel and the PLO each admitted that the other had a right to exist. Israel also agreed to gradually give up some of the Palestinian areas it controlled. A group called the Palestinian Authority was created to govern these areas. In 2005 Israel gave up the Gaza Strip and parts of the West Bank.

Palm

Palms are plants of the tropics and other warm regions. There are about 2,800 different species, or kinds, of palm. They grow as trees, shrubs, or vines.

Palms are a common sight on tropical beaches.

A palm has a single trunk with a tuft of large leaves at the top. The trunk can be very tall, up to 200 feet (60 meters) high. Or it can be so short that the plant is almost trunkless.

Palm leaves can be shaped like fans or feathers. They are also called fronds. Some types of palm leaves are very long with prickly tips.

Palms produce dry or fleshy fruits that vary in size, shape, and structure. The date and the betel nut are soft, fleshy fruits. The fruit of the coconut palm is hard on the outside and has moist “meat” and liquid inside.

People of the tropics depend on palms for food, oils, shelter, clothing, timber, fuel, building materials, and more. Coconuts are one of the most valuable tropical crops. They provide oil for cooking. The fiber of the coconut husk, or outer covering, can be woven into ropes and mats. Coconut shells are used to make cups and bottles. The liquid in the center is called coconut milk.

Panama

The Central American country of Panama links the continents of North America and South America. The Panama Canal cuts through the country. It allows ships to travel easily between the Atlantic and Pacific oceans. Panama's capital is Panama City.

Geography

Panama is on the isthmus, or narrow strip of land, that connects North and South America. Panama borders Costa Rica to the west and Colombia to the east. The Caribbean Sea (part of the Atlantic Ocean) lies to the north. The Pacific Ocean is to the south. More than 1,600 islands are also part of the country.

Tall volcanic mountains extend across Panama. The country's highest peak is the inactive volcano Barú, in the west. Hundreds of rivers flow down from the mountains. The Panama Canal cuts through a low-lying region in central Panama. The country's climate is warm and rainy.

Plants and Animals

Tropical rain forests grow in the northwest and the east. Grasslands cover the dryer side of the country, next to the Pacific.

Panama has a rich mixture of animals from both North and South America. The South American animals include sloths, anteaters, and armadillos. The North American animals include jag-

uars, tapirs, and deer. Among Panama's birds are quetzals, hummingbirds, parrots, and flycatchers.

On Panama's border with Colombia is Darién National Park. It was established to protect the area's many plants and animals. The park covers about 2,305 square miles (5,970 square kilometers).

People

More than half of Panamanians are mestizos, or people with both European and American Indian roots. Many other people have African roots. The rest of the population is white, American Indian, or Asian.

Spanish is the most common language. Most of the people are Roman Catholics. Some people practice Santería, a religion that mixes Catholic and African beliefs. More than half of the population

A hut stands in the shade of some palm trees on a beach in Panama.

lives in cities or towns, especially in and around Panama City.

Economy

Services related to the Panama Canal are very important to Panama's economy. Other services include banking, insurance, and tourism.

Panama's factories make petroleum (oil) products, beverages, clothing, and cement. Farmers grow sugarcane, bananas, rice, corn, and oranges. Cattle and pigs are the main livestock. Shrimp is the most valuable product of Panama's fishing industry.

History

Hundreds of thousands of American Indians lived in the region when Spanish explorers arrived in 1501. The Spanish killed many Indians. They also brought in slaves from Africa. Panama became a center of trade. English pirates called buccaneers destroyed many Spanish settlements in the 1500s and 1600s.

In 1821 Panama gained independence from Spain. It joined a new union called Gran Colombia, which also included Colombia, Venezuela, and

Ecuador. When the union broke up in 1830, Panama remained part of Colombia.

In 1903 the United States helped Panama win independence from Colombia. Panama's new government gave the United States the right to build a canal through a strip of land called the Canal Zone. The Panama Canal opened there in 1914. The United States continued to control the Canal Zone.

Panama went through a long period of unrest. The government was overthrown many times. People also were angry at having U.S. troops in the Canal Zone. In the 1980s the military dictator Manuel Noriega took power. He did not allow anyone to question his rule. He also made money from selling illegal drugs.

In 1989 the United States invaded Panama and removed Noriega from power. Democratic government returned to the country. The United States gave Panama full control over the Panama Canal in 1999.

Panama Canal

Large and small ships pass through one set of locks on the Panama Canal.

The Panama Canal is a waterway that connects the Atlantic and Pacific oceans. It cuts through a narrow strip of land in Panama, a country of Central America. Before the canal was built, ships traveling between the east and west coasts of North America had to go all the way around South America. The canal made the trip about 9,200 miles (14,800 kilometers) shorter.

The Panama Canal is about 40 miles (65 kilometers) long. It connects two of Panama's port cities. One is Colón, which lies on the Caribbean Sea, an arm of the Atlantic Ocean. The other is Balboa, on the Pacific. The canal runs through Gatún Lake and the much smaller Miraflores Lake.

Locks

The different parts of the canal are at different heights above sea level. Gated sections called locks raise and lower ships so they can pass from one water level to another. The canal has three sets of locks.

History

The Panama Canal was built in the early 1900s. In 1903 Panama gave the United States the right to build a canal through the country. It also gave the United States control of a strip of land called the Canal Zone. Building the canal was a huge job. At times more than 40,000 people worked on it. The canal took 10 years to build. It was opened to ships on August 15, 1914.

Even though the canal cut through Panama, the United States governed it through the 1900s. This situation caused much trouble between the United States and Panama. On December 31, 1999, the United States turned over the canal and the Canal Zone to Panama.

Panama City

Population
(2000 census),
city, 415,964;
(2005
estimate), urban
area,
1,216,000

Panama City is the capital of Panama, a country in Central America. It is Panama's largest city. It lies on a gulf of the Pacific Ocean. The Panama Canal is nearby. The canal links the Pacific and Atlantic oceans.

Panama City has mountains and the Pacific Ocean nearby.

The economy of Panama City depends largely on the canal. Many businesses in the city provide services to ships traveling on the canal and to canal workers. Panama City is also an important banking center.

An American Indian fishing village was once located on the site of Panama City. Spain took over the area in the 1500s. A Spanish soldier named Pedro Arias Dávila founded Panama City in 1519. Pirates destroyed the city in 1671, but the Spanish later rebuilt it.

In 1903 Panama became an independent country with Panama City as its capital. Soon afterward the Panama Canal was built. It was opened to world trade in 1914. Panama City then developed rapidly into a modern city.

Pancreas

The pancreas is a part of the body's digestive system. It produces juices

called enzymes, which help the body to digest food. The pancreas also produces two kinds of hormones, or substances that control certain activities in the body. All animals that have a backbone have a pancreas.

Structure

In human beings the pancreas is soft and yellowish. It is about 6 to 8 inches (15 to 20 centimeters) long and about 1 inch (2.5 centimeters) thick. It lies behind the stomach on the left side of the body.

Jobs of the Pancreas

When food enters the small intestine, the intestine releases hormones. These hormones cause the pancreas to produce digestive enzymes. The enzymes travel through tubes from the pancreas into the small intestine. There the enzymes help digest fats, starches, and proteins.

The pancreas also produces hormones. They are called insulin and glucagon. The job of these hormones is to control the amount of glucose, or sugar, in the blood. Glucose is the main source of energy for the body's cells.

Tubes carry enzymes from the pancreas to the small intestine.

Insulin moves through the bloodstream and helps cells throughout the body take the glucose they need from the blood. Glucagon does the opposite. It causes the liver to add glucose to the blood. Together these hormones keep glucose in the blood at a healthy level.

Problems with the Pancreas

Infections and cancer can affect the pancreas. One type of an illness called diabetes happens if the pancreas produces too little insulin. The lack of insulin means that the blood contains too much sugar. People with this type of diabetes must eat a diet low in sugar. They may also have to take medicines that contain insulin.

Panda

The name panda is used for two mammals that live in Asia: the giant panda and the lesser panda. Even though they share a name, the two animals look very different. The giant panda belongs to the bear family. The much smaller lesser panda is related to raccoons. Both the giant panda and the lesser panda are endangered species, meaning that they are in danger of dying out.

Giant Panda

The giant panda is found only in bamboo forests in central China. The giant panda has a bulky body and a round head. Its fur is white with black on the

The giant panda is found in bamboo forests in the mountains of central China.

shoulders, legs, and ears and around the eyes. Males grow to about 5 feet (1.5 meters) tall and weigh about 220 pounds (100 kilograms). Females are usually smaller.

Giant pandas usually live alone. They spend most of their time on the ground, but they can also climb trees. They eat mostly bamboo. Wild pandas spend up to 16 hours each day eating up to 40 pounds (18 kilograms) of bamboo. In zoos they also eat grains, fruits, and vegetables.

Lesser Panda

The lesser panda lives in high mountain forests in China, Myanmar, and Nepal. It is also called the red, or common, panda. It has thick reddish brown fur and a long, bushy tail like a raccoon's. The lesser panda only grows to about 20 to 26 inches (50 to 65 centimeters) long, not including the tail. It weighs

The lesser panda looks more like a raccoon than a bear.

about 6 to 10 pounds (3 to 4.5 kilograms). Its face is white, with a red-brown stripe running from each eye to the corners of the mouth.

Lesser pandas travel in pairs or small family groups. They eat bamboo and other plants, fruit, and sometimes small animals. They feed on the ground at night. During the day they sleep in trees.

Pandora

In ancient Greek mythology Pandora was the first woman on Earth. Her story begins with the fire god Prometheus. Prometheus stole fire from the gods and gave it to humans. This angered Zeus, the ruler of the gods. He plotted to punish humans.

Zeus ordered Hephaestus, the god of fire and craftsmen, to make Pandora out of earth. Each god then contributed some-

Pandora was the first woman on Earth according to ancient Greek mythology. When she opened a jar (known as Pandora's box) troubles flew out into the world.

thing to her. For instance, Aphrodite, the goddess of love, gave her beauty.

Zeus then sent Pandora to Earth. There she found a mysterious jar—which is sometimes called Pandora’s box. Pandora was warned not to open the jar. But she was overcome by curiosity. According to one story, as she lifted the lid, all kinds of evils flew out. She replaced the lid, but it was too late. Troubles had already covered the world. The only thing left in the jar was hope.

Papaya

Papayas are tropical fruits. They look like small cantaloupes or honeydew melons. In some places papayas are called papaws or pawpaws. The scientific name of the papaya plant is *Carica papaya*.

Papayas grow in tropical areas around the world. The papaya plant is as tall as a tree. Some papaya plants reach 26 feet (8 meters) in height. Their leaves can be as big as 2 feet (0.6 meter) across.

A papaya fruit contains many small seeds.

Papaya fruits are usually yellow or orange. Some types remain green when ripe. Papayas are about 3 to 20 inches (7.6 to 51 centimeters) long. They can weigh as much as 20 to 25 pounds (9 to 11 kilograms). The inside of a papaya is very juicy. In the center are many round, wrinkled black seeds.

Papayas have a slightly sweet taste. They are also a good source of vitamins A and C. Many people eat papayas at breakfast. Papayas are also used to make salads, jellies, pies, and juices.

Paper

Paper is a thin material that people use for writing, printing, wrapping, and many other purposes. People usually make paper out of natural fibers, or long, thin strands of plant material. Today most paper contains wood fibers, called wood pulp.

How Paper Is Made

Hundreds of years ago people made paper by hand. Today machines produce most paper. But the papermaking process remains much the same. First, the wood fibers are soaked in water. This creates a soupy mixture. Next, this mixture is spread on a screen. The fibers stick to the screen and bond together while the water drains through it. Rollers then press out more water. The fibers also may be dried with heat. Once the fibers are dry, they have become a sheet of paper.

The paper may be pressed again to flatten and smooth it. Machines also may coat the paper with chemicals to make it better for printing or other purposes.

Types and Uses

There are many different types, or grades, of paper. Everyday writing and printer paper, called bond, is thin and smooth. Some paper, especially paper used for arts and crafts, is thicker and sometimes textured. Cardboard is a rough, thick type of paper used to

Modern paper mills have equipment to make large amounts of paper very easily.

After paper has dried it can be peeled off the screen that it formed on.

make boxes and other packaging. Paper used for newspapers, called newsprint, is thin and cheap. Recycled paper is made from used paper or leftover bits of new paper.

Paper has many other practical and creative uses. People use paper to make books, cards, gift wrap, money, egg cartons, and hundreds of other items.

History

People in China made the first paper almost 2,000 years ago. This early paper was made from linen fibers, ground up mulberry bark, and other materials. From China the art of papermaking slowly spread throughout the world.

Until the early 1800s people usually made paper from rags and other cloth fibers. Then they began to use wood pulp. At about this time people also began to use machines to make paper.

Papua New Guinea

Masked warriors dance at a gathering of some of the many different peoples of Papua New Guinea.

Papua New Guinea is an island country in the Pacific Ocean. Port Moresby is the capital and largest town.

Papua New Guinea lies north of Australia. Most of the country's land is on the eastern half of the island of New Guinea. (Papua, a province of Indonesia, takes up the western half.) About 600 smaller islands make up the rest of the land. Tall mountains rise on the main island. Papua New Guinea's climate is warm and rainy.

Rain forests cover much of the land. Pine, oak, and cedar trees grow in the higher regions. The country's animals include tree kangaroos, wallabies, and egg-laying mammals called echidnas.

More than 700 different ethnic groups live in Papua New Guinea. The groups are divided into two categories: Papuan and Melanesian. Papuans make up most of the population. They live mainly on the island of New Guinea. Melanesian peoples live near the coasts and on other islands. English, Tok Pisin, and Motu are common languages. Most of the people are Christians.

Mining is an important part of the economy. The country has deposits of gold, copper, oil, and coal. However, most of the people are farmers. Crops include coffee, cocoa, coconuts, bananas, sweet potatoes, tea, and oil palm fruit.

Humans first came to the islands thousands of years ago. In 1884 Germany and Great Britain divided the islands between themselves. Australia took control in the 1900s.

In 1975 Papua New Guinea gained independence. It joined the Commonwealth, a group of countries with ties to Britain.

Paraguay

The country of Paraguay in South America is landlocked, or surrounded by land. However, Paraguay has many rivers that flow to the Atlantic Ocean. The name Paraguay came from an American Indian word meaning “river that gives birth to the sea.” Paraguay’s capital is Asunción.

Geography

Paraguay borders Bolivia, Brazil, and Argentina. The Paraguay, Apa, Paraná, and Pilcomayo rivers run along most of the country’s borders.

The Paraguay River also runs through the center of Paraguay. West of the river is a dry, flat region called the Chaco Boreal. Few people live there. East of the river are wooded hills and grassy plains. The country’s highest peak is Mount San Rafael in the southeast. Paraguay’s summers are hot and rainy. Winters are warm and fairly dry.

Plants and Animals

The trees in eastern Paraguay are mostly evergreens. The leaves of one type of tree are used to make yerba maté, a popular tea in South America. Cacti, thorny shrubs, and quebracho trees grow in the west. The bark of the quebracho tree contains a substance called tannin, which is used in making leather.

Animals found in Paraguay include monkeys, armadillos, anteaters, otters, boars, tapirs, and jaguars. Brightly colored parrots, toucans, and other birds live in the forests. Snakes and iguanas are also common.

People

Most of Paraguay’s people are mestizos, or people with a mixture of Spanish and American Indian roots. Spanish and Guaraní are the main languages. About 90 percent of the population is Roman Catholic. More than half of the people live in cities or towns. Almost all of Paraguay’s people live in the east.

Economy

Paraguay’s economy is based on agriculture. The country sells soybeans, meat, and cotton to other countries. Many farmers, however, grow only enough food for their own families. Cassava, sugarcane, corn, oranges, sweet potatoes, and bananas are important crops. Cattle are the main livestock.

Dancers in Paraguay wear colorful clothing.

Paraguay's industries make soybean oil, sugar, cloth, leather goods, and wood products. Dams on Paraguay's rivers produce electricity.

History

Guaraní Indians lived between the Paraguay and Paraná rivers long before Europeans arrived in the 1520s. Spanish

settlers mixed peacefully with the Guaraní. Beginning in 1776 Spain ruled Paraguay as part of a territory called Río de la Plata. In 1811 Paraguay declared its independence.

In the 1860s Paraguay fought a war against Argentina, Brazil, and Uruguay. When the fighting ended in 1870, Paraguay had lost more than one third of its population. During 1932–35 Paraguay fought the Chaco War with Bolivia. Both countries wanted the same land in the Chaco region. Paraguay won most of the Chaco territory.

In 1954 General Alfredo Stroessner seized power in Paraguay. The military finally forced Stroessner to step down in 1989. In the 1990s Paraguay returned to democracy. However, the country still faced many problems.

Suriname

Parasite

A parasite is an organism, or living thing, that lives on or inside another organism. It depends on the other organism for food and other things that it needs to live. The parasite's victim is called its host. The host is usually much larger than the parasite.

Different kinds of parasites have different effects on their hosts. Some parasites cause disease. Others cause pain. Others are almost never noticed by their hosts. However, the basic relationship is always the same—good for the parasite, harmful for the host.

Kinds of Parasites

Parasites occur among all the major groups of living things. Viruses, bacteria, protozoans, fungi, plants, and animals all may live as parasites.

All viruses and many bacteria are parasites. They live inside cells of the host's body. Diseases caused by viruses include measles, chicken pox, and AIDS. Parasitic bacteria cause diseases ranging from acne to the plague.

The mistletoe plant is a parasite because it digs its roots into a tree branch and takes food from the tree. But mistletoe also makes some food for itself.

Protozoans are one-celled organisms that may live either on their own or as parasites in animals. About one third of the thousands of types of protozoans are parasitic. The protozoans of the scientific group *Plasmodium* cause the disease malaria.

Parasitic fungi attack both plants and animals. Rusts, mildews, and smuts are parasitic fungi that cause diseases in plants. In humans, parasitic fungi cause the skin conditions called ringworm and athlete's foot.

Some types of plants live as parasites on other plants. For example, mistletoe grows on trees and uses them for support. It also gets some nutrients from the trees.

Parasitic animals live either on or inside the host. Certain worms make up one

large group of animal parasites. Many live in their host's digestive system and feed on the food that passes through. Fleas and lice are parasitic insects that live on the bodies of mammals or birds.

How Parasites Are Spread

Parasites can be spread from one host to another through the air, contaminated water or food, or feces. Some parasites rely on a third organism to spread them to their host. *Plasmodium* protozoans, for example, are spread through the bites of certain mosquitoes. Other parasites pass through more than one host. The roundworms that cause the disease called trichinosis are an example. Pigs are their first host, and the humans that eat the meat of the pigs are their second host.

Paris

Population

(2005 estimate), city, 2,153,600; urban area, 9,854,000

Paris is the capital of the country of France. It has long been one of western Europe's major centers of culture and business. Some of the world's greatest artists, writers, scholars, fashion designers, and chefs have lived in Paris.

The Eiffel Tower rises above Paris.

The city is also famous for its beauty. The Seine River flows through the city center.

Places of Interest

Paris has many famous landmarks. The soaring curves of the Eiffel Tower can be seen from far away. It has become a symbol of the city. The Arc de Triomphe is a large arch honoring the military. The cathedral of Notre Dame is a church

built from the 1100s to the 1300s. It is known for its windows of colored glass and its tall stone arches.

The most important of Paris' many museums is the Louvre. It has a huge collection of art, including Leonardo da Vinci's painting of the *Mona Lisa*.

Economy

Many large companies have headquarters in Paris. It is a major banking center. Tourism, government, insurance, and other service industries are also important to the economy. Factories in the city make clothing, jewelry, and cosmetics.

History

Paris began on an island in the Seine River. A people called the Parisii founded a town there more than 2,000 years ago. The Romans captured the

Visitors can see the sights of Paris from boats on the Seine River.

town in 52 BC. The town later spread onto the riverbanks.

In AD 987 Paris became the capital of France. The city and its economy grew. In the 1300s, however, a disease called the plague killed many of its people.

Paris began to grow again in the late 1500s. The major events of the French Revolution took place in the city in the late 1700s. Paris was then the site of great violence. In the 1800s construction projects made Paris more modern and beautiful.

German troops took control of Paris in the 1940s, during World War II. After the war the city rebuilt its economy. In the late 20th century large building projects added new landmarks to the French city.

Parkinson's Disease

People with Parkinson's disease slowly lose control of their muscles. The disease causes tremors, or shaking. It usually affects people who are in their 60s or 70s. It is named for a British doctor named James Parkinson. He first described the disease in 1817.

The early symptoms, or signs, of Parkinson's disease include weakness and tiredness. A person's hands may shake. As

The boxer Muhammad Ali and the actor Michael J. Fox suffer from Parkinson's disease. Both men have supported efforts to find a cure.

time passes, the arms and legs become stiff. The person's handwriting gets smaller. It becomes hard to speak. Walking becomes a shuffling movement.

No one is sure what causes Parkinson's disease. Some scientists think that it is caused by harmful chemicals. Others think that the disease runs in families.

Scientists do know how Parkinson's disease affects the brain and the body. For some reason nerve cells in the brain begin to die. These cells normally make a chemical called dopamine. Dopamine helps control movement. When the amount of dopamine is low, a person loses control over the body's movements.

There is no cure for Parkinson's disease. There is also no way to prevent it. However, doctors can treat the symptoms. Certain medications help create dopamine. Others slow down its loss. These

medications can temporarily ease the effects of the disease. Physical therapy may also help. In some cases doctors can perform surgery.

Parks, Rosa

In 1955 Rosa Parks refused to give up her seat on a Montgomery, Alabama, city bus to a white person. Her action sparked the U.S. civil rights movement.

Early Life

Rosa Parks was born Rosa Louise McCauley on February 4, 1913, in Tuskegee, Alabama. As an African American in Alabama, she had to live with segregation, which means separation of the races.

Rosa Parks sits on a bus in Montgomery, Alabama, in 1956.

Rosa married Raymond Parks in 1932. After her marriage she joined the National Association for the Advancement of Colored People (NAACP). The NAACP worked to make life better and fairer for African Americans. Parks became a leader of the NAACP branch in Montgomery.

The Bus Ride

On December 1, 1955, Parks was riding a then segregated Montgomery city bus. She was sitting in a section where whites had first pick of seats. A white man wanted her seat, but Parks refused to move. She was arrested, jailed, and fined.

The city's African Americans then decided to boycott, or not ride city buses until the segregation law was changed. The boycott was led by Martin Luther King, Jr., who was then just beginning his career as a civil rights leader.

The Montgomery boycott went on until 1956, when the U.S. Supreme Court decided that the U.S. Constitution did not allow segregation of buses. This gave hope to people who wanted all kinds of racial segregation to end. Within the next 10 years much progress was made.

Later Life

Parks was fired from her job and threatened by white people. She and her family moved to Detroit, Michigan, in 1957. She then worked in the office of U.S. Representative John Conyers, Jr. She was honored with two of the country's highest civilian awards: the Presi-

dential Medal of Freedom (1996) and the Congressional Gold Medal of Honor (1999). Rosa Parks died in Detroit on October 24, 2005.

Parliament

Parliament is the legislature, or lawmaking group, in the government of the United Kingdom (Great Britain). The government leader, called the prime minister, is always a member of Parliament. This makes Britain different from the United States, which keeps Congress and the president in separate branches of government.

Other countries that Britain once ruled have parliaments also. Australia, New Zealand, Canada, and India are among the former British colonies that have parliaments.

Britain's Houses of Parliament

Britain's Parliament consists of two houses: the House of Lords and the House of Commons. There are about 700 members in the House of Lords, but not all of them participate. There are 646 members in the House of Commons.

For many years most members of the House of Lords were nobles, or people born into the upper classes. These people inherited their seats in the house.

The prime minister of Canada (standing) answers questions from members of the House of Commons. The House of Commons is one part of the Canadian Parliament.

Since 1999 the house has been made up mainly of people chosen by the government for outstanding achievement. Senior judges and senior clergy (church leaders) of the Church of England are also members. The member in charge of the House of Lords is called the lord chancellor.

Members of the House of Commons are elected by the people. The ruling party schedules elections, but there must be an election at least once every five years. The member who leads the ruling party serves as prime minister. The heads of government departments, called the Cabinet, are also members of Parliament. A member called the speaker controls the debates, or arguments, in the house.

How the British Parliament Works

The main function of the House of Commons is to make laws. First a

An illustration shows Queen Elizabeth I at the head of England's Parliament. Elizabeth ruled over England, which is now part of the United Kingdom, from 1558 to 1603.

member—usually a Cabinet member—proposes a law. The members debate the proposed law, or bill. If the members agree, the bill goes to a committee. The committee sometimes makes changes. The committee then sends the bill back to the House of Commons. If the house approves the bill, it sends it to the House of Lords. The Lords may approve the bill or make changes and send it back to the Commons.

Once both houses have approved a bill, it becomes law after the monarch (king or queen) agrees to it. Modern monarchs agree to all bills Parliament passes.

Bills also can start in the House of Lords, but this rarely happens. In addition, it is possible for a bill to become law without being passed by the Lords.

For example, if the House of Lords does not approve a bill, it can become law if the House of Commons passes it again one year later.

History

The beginnings of the British Parliament have been traced back to the witenagemot. This was a council of advisers to Britain's Anglo-Saxon kings. Modern Parliament developed from meetings of nobles and important people in the 1200s. Over time the power of Parliament grew. In 1689 Parliament passed a law that became known as the Bill of Rights. This act gave Parliament power over the monarch.

Parrot Family

Most of the birds of the parrot family are known for their colorful feathers, noisy calls, and curved beaks. They are among the world's most popular pet birds. They are smart and very social, and they tend to live a long time. Some types, such as the African gray parrot, are excellent at imitating human speech.

This scientific family includes many birds besides parrots. Among them are macaws, lovebirds, lorries, lorikeets, keas, and parakeets, including the budgerigar, or budgie. Cockatoos and cockatiels belong to a closely related family. People often call the birds of both these families parrots.

Where Birds of the Parrot Family Live

Parrots and their relatives are found mainly in the southern half of the world. Most of these birds live in warm or hot rain forests.

Physical Features

The birds of the parrot family vary greatly in size—from 3 to 40 inches (8 to 100 centimeters) in length. Several types of parrot are mostly bright green. Red, yellow, and blue feathers are also common. However, cockatoos are mainly white, black, pink, or gray. They often have tufts of feathers, called crests, on their heads.

Parrots and their relatives have sturdy bodies and short necks. Two of the toes on each foot point forward, and the other two point backward. Their feet are useful for both climbing and grasping. These birds also use their thick, hooked bills to help them climb trees. Their strong bills can crack open hard nutshells, too. They eat mainly seeds, nuts, and fruits.

Endangered Birds

Many types of these birds are in danger of dying out completely. People have cut down the trees in many forests where parrots live in order to use the land for farms, houses, or businesses. In addition, people catch many of these endangered birds to sell as pets—even though this is against the law.

Passover

In Judaism, Passover (or Pesach) celebrates the freedom of the Jews from slavery in ancient Egypt. Thousands of years ago the early Jews, called Israelites, moved to Egypt, where they became slaves of the Egyptians. It is believed that Moses was chosen to go to the pharaoh, or king of Egypt, to demand that he free the Israelites from slavery. The pharaoh said no, so God sent down 10 plagues (or punishments) to force the king to change his mind. The word Passover comes from the 10th plague, in which the firstborn sons of the Egyptians were killed. The Israelites were spared from the plague because Moses had told them to mark their door posts so that the angel of death would pass over them. The son of Egypt's pharaoh died from the plague. In his grief the pharaoh ordered Moses and the Jews to leave Egypt.

Did You Know?

Passover is celebrated for seven or eight days beginning on Nisan 15 of the Hebrew calendar.

Brightly colored lorikeets perch on the branch of a tree.

Families and friends often gather for a meal called a seder to celebrate Passover.

The festival of Passover is one of great joy. It takes place for about one week in March or April. A special family meal called a seder is held the first and sometimes the second night of Passover. Before the meal the story of Passover is told through the songs and prayer of the Haggadah, which is the book used during the seder. The most important food of the holiday is matzo, which is a bread made with only flour and water. It is unleavened, which means that it is flat. This reminds the Jews of the bread the Israelites took with them when they fled Egypt for freedom. They did not have time to let it rise because they were in a hurry to leave.

Pasteur, Louis

Louis Pasteur was a French scientist who made important discoveries about the role of microbes (germs) in disease and in food spoiling. These discoveries have saved many lives. They have also made

food safer to eat and protected the health of farm animals. Pasteur was a courageous scientist who constantly asked questions, searched for answers, and challenged incorrect ideas.

Pasteur was born on December 27, 1822, in Dole, France. He received a Doctor of Science degree in 1847. He then taught chemistry at French universities.

While working at the University of Lille, Pasteur discovered that fermentation involved microbes. Fermentation is a chemical change used to make bread, wine, cheese, and other foods. Pasteur showed that heat killed the microbes that cause fermentation. This discovery led to his invention of a process for destroying harmful microbes in food. This process became known as pasteurization. It slows down the spoiling of food. Pasteurization is still used today, especially to make milk safe to drink.

Louis Pasteur performs a scientific experiment in a laboratory.

Pasteur discovered that many diseases are caused by microbes. He developed a method of preventing disease called vaccination. Vaccination involves putting weakened germs into an animal's or person's body. The weakened germs do not make the animal or person sick. Instead, the body "learns" how to fight off the disease caused by that germ.

In 1881 Pasteur successfully vaccinated sheep against a disease called anthrax. He also developed a vaccination against rabies. Pasteur died on September 28, 1895, in Saint-Cloud, France.

Pawnee

The Pawnee are Native Americans of Oklahoma. They traditionally lived on the plains of what is now the U.S. state of Nebraska.

The Pawnee lived in large, dome-shaped homes called lodges. They made their lodges using earth, or dirt. Each lodge was large enough for related families. The Pawnee grew corn, beans, squash, and pumpkins. They also hunted bison (buffalo). The Pawnee lived in tepees covered with bison skins while on the hunt.

Spanish explorers arrived in Pawnee lands in the 1500s. In the 1600s and 1700s the Pawnee got horses from the Spanish. They used the horses to hunt

A photograph from the late 1800s shows Pawnee men wearing traditional clothing.

bison. However, unlike other tribes of the Great Plains, they continued to farm for much of their food.

The Pawnee generally had a peaceful relationship with white settlers. Many Pawnee worked for the U.S. Army. But diseases brought by the settlers, such as smallpox, killed many Pawnee.

In the middle of the 1800s the Pawnee turned over their Nebraska land to the U.S. government. In 1876 the government moved the Pawnee to a reservation in Indian Territory (now Oklahoma).

At the end of the 20th century there were about 2,500 Pawnee. Most lived on or near the Oklahoma reservation.

Payton, Walter

Walter Payton was a running back for the Chicago Bears.

Walter Payton was one of the best professional football players in the United States. As a running back for the Chicago Bears, Payton set many records. His impressive abilities quickly made him a superstar.

Walter Jerry Payton was born on July 25, 1954, in Columbia, Mississippi. He was the youngest of three children. He began playing football as a junior in high school.

Payton went on to attend Jackson State University in Jackson, Mississippi. There he earned the nickname Sweetness for his charming personality and his graceful athletic style. While at Jackson State, Payton set a National Collegiate Athletic Association record for most points scored. Payton graduated in 1975 with a degree in special education.

In 1975 Payton joined the Chicago Bears of the National Football League.

He played with the Bears for his entire career. While playing for the Bears, Payton set one record after another. Most of the records were for rushing, or gaining yards toward the goal while carrying the ball. Payton also made 125 touchdowns during his career.

Payton retired at the end of the 1987 football season. He was elected to the Pro Football Hall of Fame in 1993. After his retirement, Payton worked with several charities, helped to open a restaurant, and set up his own business, the Payton Power Equipment Company. Payton died of a rare liver disease on November 1, 1999, in Barrington, Illinois.

Pea

Peas are small, round vegetables. They are high in protein and full of vitamins. Peas are among the oldest plants grown

Peas are considered members of the legume family because they have seeds that grow inside pods.

in the world. They belong to the family of plants called legumes. Beans, peanuts, and clover are other examples of legumes.

Many types of pea plant are grown throughout the world. They are hardy and leafy. Most like well-drained soil, cool temperatures, and warm sun. The climbing stem of a pea plant may reach up to 6 feet (1.8 meters) in length. The plant produces reddish purple, pink, or white flowers. Peas are annuals, meaning that they need to be replanted each year.

Peas grow in what is called a pod. A pod grows to about 4 inches (10 centimeters) long. Inside are 5 to 10 seeds, or peas. The seeds can be smooth or wrinkled, and they can be green, yellow, or white in color. The pea pods split in half when they are ripe, or ready to be eaten.

Most pods are valued only for the peas inside. But some varieties, including snap and snow peas, have pods that are eaten. Peas are sold fresh, dried, canned, and frozen.

Peace Corps

The organization called the Peace Corps promotes good feelings between the United States and countries around the world. The U.S. government runs the Peace Corps. People who work in the Peace Corps go wherever they are

A Peace Corps volunteer teaches a class in Paraguay.

needed in the world. They build schools, teach important skills, and do many other types of work. Members of the Peace Corps include U.S. volunteers and people from the countries that host the volunteers.

Background

The Peace Corps was created in 1961 under President John F. Kennedy. Kennedy's brother-in-law Sargent Shriver oversaw the program.

The number of volunteers has varied over time. In 1966 there were more than 15,000 Peace Corps workers. By the early 21st century there were fewer than 8,000 volunteers.

Volunteers have to be at least 18 years old. They sign on for a two-year term of service. They get three months of training and money for food and shelter. Volunteers are also rewarded in other ways. They learn new languages and customs. They often make lifelong friends.

Goals

The Peace Corps has three main goals. The first goal is to help people in other countries meet their needs. The second goal is to help the host countries better understand people from the United States. The third goal is to help the United States better understand people in other countries. All these goals are meant to help bring about world peace.

The Peace Corps Today

The Peace Corps has served in about 140 countries. More than 170,000 people have worked as volunteers. Today most Peace Corps volunteers have college degrees. Most are single women under the age of 30.

The services provided by the Peace Corps change according to countries' needs. In the past many volunteers worked as teachers and farmers. Today many developing countries also need help with computer skills. Other fields include health, trade, and community development.

Peace Movements

War has been a constant part of history. People throughout the world hope for peace, but it is hard to achieve. Since the 1800s groups of people have started organized movements to try to make the dream of peace a reality.

Those who oppose war for any reason are called pacifists. Before peace movements started, some religious groups already opposed all wars. Buddhists think all violence is wrong. Many Christians, including Anabaptists, Mennonites, and Quakers, are also pacifists.

The first nonreligious peace movement started in the United States in 1815. By the late 1800s people around the world were forming groups that supported peace. The horrors of World War I (1914–18) led people and even governments to form peace groups. Forty-two countries set up the League of Nations in 1920 to maintain world peace. After World War II (1939–45) the United Nations replaced the League.

When enemies attack and citizens die, peace movements often lose strength. For example, many people in the United States did not want to join World War II

Did You Know?

Siddhartha Gautama, known as the Buddha, taught that it is wrong to harm any living creature.

War protesters in the Philippines carry a big peace sign in 2003. The peace sign was first used in the United Kingdom but is now recognized around the world.

when it first began. However, after the Japanese bombed Pearl Harbor in 1941, most Americans wanted to fight.

Even during unpopular wars, peace movements may be criticized. For instance, in the 1960s young people around the world formed a peace movement to stop the Vietnam War. Many U.S. citizens, however, felt that the protesters were being disloyal to their country. In 2003 many Americans also disagreed with the peace movement to stop the U.S.-led war in Iraq.

Still, in the late 20th and early 21st centuries most countries agreed that peace was an important goal. Many governments agreed to limit the buildup of nuclear weapons. They also looked for ways to fight terrorism, another threat to world peace.

Peach

Peaches are fruits that have fuzzy skins. There are thousands of varieties of peaches. They are among the most widely eaten fruits in the world.

Peach trees grow where the weather is mild. The United States is a major producer of peaches. They grow in such states as California, Washington, South Carolina, and Georgia.

Peach trees can be 21 feet (6.5 meters) tall. Most farmers only let the trees grow to about 10 to 13 feet (3 to 4 meters).

Peaches are often a light orange color, but they can also be yellow, red, or white.

This makes it easier to pick the fruit. Flowers appear in spring. They may be white, pink, red, or purplish. The peach fruits grow from these flowers.

Farmers plant peach trees in orchards. When the fruit begins to develop, farmers cut down some of the tree branches. This helps the fruit left on the tree grow larger.

Peach fruits, or peaches, are round. They are about 3 inches (7.6 centimeters) across. Peaches may be yellow, orange, red, or white. Their skin is usually fuzzy, but some peaches are smooth. These are called nectarines. In the center of a peach is a large stone called a pit. The pit contains a single, oval-shaped seed.

People eat peaches fresh. They also use peaches to make jams, pies, cobblers, and other desserts. Peaches are sometimes canned.

Peacock

Peacocks are known for their huge fan of colorful tail feathers, called a train. People have kept these beautiful blue and green birds for thousands of years. Sometimes the word peacock is used to describe only the male bird. The female is called a peahen.

Peacocks belong to the pheasant family, Phasianidae. There are three species, or types, of peacock—the blue (or Indian) peacock, the green (or Javanese) peacock, and the Congo peacock. The only peacocks that have a train of tail feathers are the males of the blue and green types.

Peacocks usually live in lowland forests. At night they sleep in trees. The blue peacock comes from southern Asia, while the green peacock comes from southeastern Asia. The Congo peacock is found in central Africa.

A male peacock shows its fine tail feathers.

In both the blue and green types, the male's body is about 35 to 50 inches (90 to 130 centimeters) long. Its train of metallic green tail feathers is about 60 inches (150 centimeters) long. Each tail feather has a shining spot at the end of the feather that looks like an eye. A crest, or tuft of feathers, tops the male's head. The peahen of both these species is green and brown. It is almost as big as the male.

Male blue and green peacocks put on a showy display when trying to attract mates. The peacock lifts its train and spreads it like a fan. It then struts about and shakes its train, making the feathers shimmer and rustle.

The Congo peacock is mainly blue and green. Its tail is short and rounded. The peahen is reddish and green.

Peanut

Peanuts are not true nuts. They are the legumes, or pods, of the peanut plant. Because peanuts ripen underground, they are sometimes called groundnuts. The peanut plant's scientific name is *Arachis hypogaea*. It belongs to the pea family, which also includes peas, beans, and clovers.

Peanuts are grown in warm areas throughout the world. They grow best in sandy soils. China, India, the United States, and Nigeria grow most of the world's peanuts.

People crack the shells of peanuts to eat the seeds inside.

The peanut plant is a low bush. Some plants grow short branches and have an upright stem. Others have a shorter stem but grow long branches, called runners, that lie close to the soil. Small yellow flowers grow on the lower part of the plant.

After a peanut flower receives pollen from another flower, it begins to wither. A stem called a peg then grows from the bottom of the flower. It anchors itself in the soil. The tip of each peg develops into a pod beneath the soil. This underground pod becomes the peanut—a shell with two to four seeds inside.

Many people eat roasted peanut seeds as a snack. People also crush peanuts to make cooking oil and peanut butter. In the early 1900s the U.S. scientist George Washington Carver developed many other uses for peanuts. Among them were new forms of cheese, coffee, flour, ink, plastic, wood stain, and soap. Farmers feed peanut plants to livestock.

Usually the tops of the plants are fed as hay after the pods are removed.

Pear

Pears are a popular fruit that can be dried, cooked, or eaten fresh. People use pears in salads, desserts, and jams. They also drink pear juice. Pears are a good source of potassium and fiber.

Pears grow in mild regions throughout the world. China, Italy, and the United States are the countries that grow the most pears. Among U.S. states, Washington, Oregon, and California usually grow the largest amount of pears.

Pear trees can grow as tall as 50 feet (15 meters) and can live for 75 years or more. They have broad, spreading

Anjou pears have green skin, often with a touch of red.

branches and rounded or oval leaves. The leaves appear on the tree about the same time that the flowers do. Pear flowers are about 1 inch (2.5 centimeters) wide with five rounded, white petals. Part of the flower later develops into the fruit.

The fruit may be yellow, green, red, or brownish in color. Some pears are narrow at the stem and rounder on the bottom. Others are round like an apple. Pears are generally sweeter and softer than apples, though some can be slightly tart. Well-known types grown in the United States include Bartlett, Bosc, and Anjou pears.

Fruit

Robert E. Peary, wearing fur clothing, stands next to his ship's steering wheel.

always depended on help from the local Eskimo (Inuit) people.

In 1892 Peary discovered the northern coast of the island of Greenland. This proved that Greenland did not extend all the way to the North Pole. In fact there is no land at the pole, only drifting ice. In Greenland Peary found meteorites, or rocks that had fallen from space.

North Pole

Peary tried several times to reach the North Pole before he succeeded. During one trip he lost several toes due to frostbite. In 1905–06 he used a powerful ice-breaking ship for the first part of his trip. This time Peary came closer to the Pole than anyone before him had come.

Peary tried again in 1908. He, Henson, and four Eskimo made the last stage of

Did You Know?

A doctor and explorer named Frederick A. Cook claimed that he reached the North Pole in 1908, a year before Peary. Few people now take Cook's claim seriously.

Peary, Robert E.

Robert E. Peary was the most famous U.S. explorer of the Arctic regions. He may have been the first person to reach the North Pole.

Robert Edwin Peary was born in Cresson, Pennsylvania, on May 6, 1856. He grew up in Maine. He studied engineering in college and then joined the U.S. Navy.

Early Exploring

Peary made his first expedition, or exploring trip, to the Arctic in 1886. Then he met Matthew Henson, who had traveled the world while working on a ship. Henson went with Peary on all his later expeditions. The explorers

the trip on dogsleds. They did not always stay together. Peary and Henson probably both reached the North Pole on April 6, 1909. Some people believe that Henson reached the Pole before Peary. As an African American, however, Henson faced racial prejudice. This may have kept him from receiving credit for the accomplishment.

Peary retired from the Navy in 1911. He died in Washington, D.C., on February 20, 1920.

Pegasus

Pegasus was a winged horse in ancient Greek mythology. According to legend, he was created when the hero Perseus cut off the head of a frightful monster. Pegasus sprang from the monster's blood.

One famous story about Pegasus involves a young man named Bellerophon. Bellerophon wanted to ride Pegasus. Athena, the goddess of wisdom, helped him catch the flying horse. When he was riding Pegasus, Bellerophon was unbeatable. He was even able to kill the Chimera, a fire-breathing creature that was part lion, part goat, and part dragon.

Pegasus and Bellerophon had many adventures together. Bellerophon became a hero. But one time he tried to ride Pegasus up to Mount Olympus, the

In ancient Greek mythology, Pegasus was a horse with wings.

home of the gods. Pegasus knew it was wrong for Bellerophon to attempt such a thing. He threw Bellerophon to the ground.

According to the story, the gods rewarded Pegasus with a home on Mount Olympus. Pegasus became the favorite of Zeus, the chief god. The Greeks believed that whenever Zeus wanted to throw his thunderbolt, Pegasus brought him the thunder and lightning. Eventually, Pegasus was turned into a constellation, or a group of stars.

Pelé

Pelé was a world-famous soccer player from Brazil. He was known for his

Pelé takes the ball down the field.

tremendous speed and balance, his jumping and ball-controlling abilities, and his spectacular goals. During his career Pelé played in 1,363 games and scored 1,281 goals.

Pelé was born on October 23, 1940, in the small village of Três Corações, Brazil. His real name is Edson Arantes do Nascimento. At some point he took the nickname Pelé, which has no particular meaning.

Pelé's father taught him how to play soccer. Pelé dropped out of school so he could spend more time on the game. By age 11, he began to receive professional coaching.

In 1956 Pelé began his professional career. He played for the Santos Football Club. Pelé led Santos to many championships and broke many records. He remained with the team until 1974.

Pelé led Brazil's national team to three World Cup championships. The first time was in 1958, when he was only 17 years old. He astonished the world by scoring six goals, including two in the championship game. With Pelé's help, Brazilian teams also won the World Cup in 1962 and 1970.

In 1975 Pelé joined the New York Cosmos. He led the team to a league championship in 1977 and then retired.

After retiring, Pelé composed music, wrote several books about his life, and appeared in a number of films. He also worked for children's causes. In the

1990s Pelé served as Brazil's minister of sports for four years.

Pelican

Pelicans are among the largest flying birds. They are famous for their huge throat pouches. A pelican uses its pouch and its very long bill to scoop up fish.

Pelicans live around lakes, rivers, and seacoasts in many parts of the world. They often fish and fly in small groups. They breed in very large groups on islands.

Scientists classify pelicans in the genus, or group, called *Pelecanus*. There are several different species, or types, of pelican. They are related to cormorants and gannets.

Most pelicans have mainly white feathers. The best-known types are the North American white pelican and the European white pelican. The brown pelican is darker. In all types the throat pouch does not have any feathers.

Some kinds of pelican can be more than 70 inches (180 centimeters) long. They may weigh more than 30 pounds (13 kilograms). Pelicans have long wing-spreads. Their wings can sometimes stretch more than 9 feet (2.7 meters) from tip to tip. This makes them good flyers. Their webbed feet help them swim. However, their short legs make them look clumsy on land.

A brown pelican perches on a net.

Pelicans eat several pounds of fish each day. Swimming pelicans often line up in a group and herd fish into shallow water. There they can easily scoop up the fish. A pelican holds fish in its throat pouch while squeezing water out of the corners of its mouth. Then it swallows its catch. The brown pelican fishes in a different way. It dives from high above the water.

Pendulum

In its simplest form, a pendulum is a weight that hangs from the end of a wire or a string. One end of the wire is attached to a fixed point. The weight, called the bob, hangs at the other end. If a person pulls the bob back and lets go, the pendulum swings freely. Once a pendulum is moving, it never twists or spins.

The bob of a pendulum swings back and forth in a path called an arc.

In the 1500s the Italian scientist Galileo discovered that the swing of a pendulum is constant. In other words, it always takes the bob the same amount of time to swing out from its starting point and come back again. The bob will eventually move a shorter distance back and forth. Nevertheless, the bob still takes the same amount of time to complete a swing. The length of the wire or string determines how long the swing takes.

This information soon became useful in clock making. In the 1600s scientists learned to use pendulums to make more accurate clocks. Even today many clocks have pendulums inside them. The pendulum swings back and forth at a regular rate. This keeps the other parts, including the hands on the face of the clock, moving at a regular rate as well.

In 1851 a French scientist named Jean Foucault used a giant pendulum to prove that Earth rotates. He hung a heavy bob on a thick wire attached to the inside of a dome. As the bob moved,

it traced a line in the air. As the day passed, the line seemed to be changing direction. Because the pendulum was not spinning, Earth had to be rotating underneath it.

Penguin

Penguins are the only birds that can swim but cannot fly. These black and white seabirds move about very easily in the water. On land they stand upright and waddle about.

Where Penguins Live

There are 18 species, or types, of penguin. They are found mainly in the southern half of the world. Many types are found in the cold regions of Antarctica or nearby islands. Penguins also live along the cool coasts of Africa, New Zealand, Australia, and South America. The Galápagos penguin lives in a warm region off the coast of Ecuador.

Emperor penguins gather on the ice in Antarctica.

Physical Features

A penguin typically has a black back and a white belly. Different types range in height from about 14 to 45 inches (36 to 114 centimeters). The largest type is the emperor penguin, which weighs about 80 pounds (36 kilograms).

Penguins are excellent swimmers and divers. They can swim faster than 25 miles (40 kilometers) per hour. Penguins use their short, paddlelike wings as flippers for swimming. Their feet are webbed, and their bodies are shaped like torpedoes. Penguins have short legs, but they can run fairly quickly. To travel over ice and snow, a penguin may slide on its belly.

A penguin is covered nearly all over with short feathers. The feathers keep water out and trap warm air against the skin. A thick layer of fat also protects this bird from the cold.

Behavior

Penguins may stay at sea for weeks at a time. They dive after small sea animals to eat. Different types eat small fishes, squid, and shrimplike animals called krill.

Penguins breed in large groups called nesting colonies. Some types travel long distances to reach their nesting colonies. They may return to the same nesting place year after year.

Penicillin

Penicillium mold is the source of penicillin.

The discovery of penicillin was one of the greatest scientific achievements of the 1900s. Penicillin belongs to a group of medical drugs called antibiotics. These medicines fight infections caused by small living things called bacteria.

Infectious diseases once caused many deaths. The discovery of penicillin therefore saved millions of lives.

In 1928 an English doctor named Alexander Fleming discovered the effects of penicillin. While doing research on bacteria, Fleming noticed that the bacteria would not grow near a certain mold. He found that the mold was a type called *Penicillium notatum*. This mold is similar to the green fuzzy mold that grows on bread. From the mold Fleming developed the antibiotic now known as penicillin.

By the late 1930s penicillin was being used to treat infections in hospitals.

During World War II in the 1940s, military doctors used penicillin to treat infected wounds. Penicillin is now widely used in the treatment of throat infections, meningitis, and other infections.

Antibiotic • Bacteria

Penn, William

William Penn founded the colony of Pennsylvania in 1681. He wanted to create a place where many religious faiths would be allowed.

Early Life

William Penn was born in London, England, on October 14, 1644. His father was a wealthy admiral in the English Navy. As a young man, Penn left the Church of England and joined the Quakers.

William Penn

The Quakers (also known as the Society of Friends) were a Christian group that had no ministers. Instead, they held meetings at which anyone could speak. Other Christians saw the Quakers as disrespectful or even dangerous. Penn went to jail four times for his beliefs.

Founder of Pennsylvania

Like others before them, the Quakers decided to look for religious freedom in North America. In 1681 King Charles II gave Penn the right to build a colony there. The colony's name, Pennsylvania, combined Penn's family name with a Latin word for woodland.

Penn wanted Pennsylvania to be a "holy experiment" in tolerance. This meant that the colony welcomed all Christians, not just Quakers. In addition, Penn prepared a constitution, or document of government, for the colony. The constitution provided for an assembly of elected representatives.

Penn arrived in his colony in 1682. Using his instructions, the colonists had already laid out the new city of Philadelphia. Penn signed treaties of friendship with the region's Native Americans, the Delaware (Lenni Lenape) people. In 1684 Penn had to return to England. He went back to the colony in 1699 but left again in 1701. Money problems and bad health kept Penn from ever returning to Pennsylvania. He died in Buckinghamshire, England, on July 30, 1718.

Pennsylvania

The U.S. state of Pennsylvania was named after William Penn. The state's name actually means "Penn's Woods." William Penn founded the original colony in the early 1680s. Pennsylvania's nickname, the Keystone State, refers to its central location among the 13 original states. The capital is Harrisburg.

Pennsylvania played an important role in the history of the United States. From 1790 to 1800 the city of Philadelphia served as the country's capital. And during the American Civil War, one of the most important battles was fought at the Pennsylvania town of Gettysburg.

Geography

Pennsylvania is in the Middle Atlantic region of the United States. Pennsylvania's eastern boundary is the Delaware River. The river separates Pennsylvania from New Jersey and New York. In the north, Pennsylvania borders New York and Lake Erie. Southeast of Pennsylvania is the state of Delaware. West Virginia borders Pennsylvania on both the south and west. Maryland is also south of Pennsylvania, and Ohio is to the west.

Most of Pennsylvania lies within the Appalachian Mountains. High, rugged land called a plateau covers all of the north and west except for a lowland plain along Lake Erie. The Allegheny Mountains, a section of the Appalachians, run across the state from southwest to northeast. In the southeast are a hilly farming region and a plain.

People

More than four fifths of Pennsylvania's population is white. Many whites are of German, Irish, or Italian heritage. African Americans are the largest minority group in Pennsylvania. They make up about one tenth of the state's population. About 3 percent of the people are Hispanic, and about 2 percent are Asian.

The Amish are a unique religious group who live in Pennsylvania. They speak a type of German as well as the English language. The Amish way of life is the same as it was centuries ago. They live in small communities of hand-built buildings and do not use electricity. Instead of automobiles they travel in horse-drawn wagons.

Economy

Pennsylvania has one of the strongest economies of all the states. The major manufactured products are chemicals,

metal goods, and processed foods. Two companies in the state make well-known food products. The Hershey company is famous for its chocolate and H.J. Heinz is famous for its ketchup.

Although much of the land is mountainous, Pennsylvania has many valleys suitable for farming. Dairy and beef cattle and chickens account for much of the state's farm income. Pennsylvania is a major producer of milk, cheese, eggs, mushrooms, and fruit. Forestry is also important.

Tourism adds billions of dollars to Pennsylvania's economy each year. The tourism industry creates jobs in hotels, restaurants, and the travel business. Each year millions of tourists visit the state's famous historical sites. Many people go to Philadelphia to see Independence Hall and the Liberty Bell. Tourists also visit the historical parks at Valley Forge and Gettysburg.

History

Before the 1600s only Native Americans lived in the region now known as Pennsylvania. The region's four major Native American groups were the Delaware, the Susquehannock, the Shawnee, and the Iroquois. Swedes from northern Europe founded the area's first colony in 1638. The Dutch took over the territory in 1655, and nine years later the English seized the land.

In 1681 King Charles II of England granted the Pennsylvania region to William Penn. Penn wanted to start a new

An Amish family works on a farm in Pennsylvania. The Amish first came to Pennsylvania in the 1700s.

colony in America. He was a member of the religious faith known as the Society of Friends, or Quakers. In England, the Quakers had been punished for their religious beliefs. Penn established the new colony in order to create a safe place for the Quakers. In Pennsylvania the religious practices of the Quakers and other religions were respected. The religious freedom of Pennsylvania attracted many people to the colony. Philadelphia, the colonial capital, became the largest city in the American Colonies.

Pennsylvania was a key state during the period of the American Revolution (1775–83). The Declaration of Independence was signed in Philadelphia. Valley Forge was the site of the Continental Army's winter camp in 1777–78. After the Revolution was won, the U.S. Constitution was written in Philadelphia in 1787. Pennsylvania became the second state to approve the document, on December 12, 1787.

Pennsylvania remained with the Union during the American Civil War (1861–65). In 1863 one of the key battles of the war took place at Gettysburg, in the southern part of the state. Not long after the bloody fight had ended, a part of the battlefield was dedicated as a national cemetery. During the dedication ceremony, President Abraham Lincoln delivered his famous Gettysburg Address.

Many parts of Pennsylvania became industrial centers in the 1800s. Coal mining and steelmaking were very important industries. The steel industry was centered in Pittsburgh. During World War I (1914–18) and World War II (1939–45), Pennsylvania's industries were major suppliers of iron and steel, arms, and machinery. In the decades after World War II, however, the state's coal and steel industries became much less important.

In 1979 the first major nuclear accident in the United States took place at the Three Mile Island nuclear power plant near Harrisburg. Cleanup of the radioactive waste cost more than a billion dollars.

An old cannon stands in the Gettysburg National Military Park in southern Pennsylvania. The park has many monuments to the soldiers who fought there. It also features exhibits that explain what happened during the battle.

On September 11, 2001, an airplane flying over western Pennsylvania was taken over by a group of hijackers. The passengers stopped the hijackers from continuing to the East Coast and crashing the airplane into a building. Instead the airplane crashed in a field southeast of Pittsburgh. The plane was one of several taken over by terrorists on that day.

Peony

Garden peony flowers range in color from white to pink to deep red.

Peonies are flowering plants with large blossoms. There are two basic types: garden peonies and tree peonies. Most garden peonies are native to Europe and Asia. All tree peonies originated in China.

Peonies grow best in sunny areas. Flowers bloom in late spring or early summer and last about one week. Then the plants produce seed pods. Some garden peonies can live for more than 30 years.

Garden peonies grow to about 3 feet (1 meter) in height. Most types produce only one flower on a stem. Flowers may grow up to 6 inches (15 centimeters) across. They are commonly white, pink, magenta, or deep red. Each flower has 5 to 10 petals. The flowers often have ants crawling on them. The ants are attracted to the nectar the buds produce.

Tree peonies are shrubby plants. Their woody stems can grow to about 7 feet (2 meters) tall. Flowers may be white, yellow, lilac, violet, or red. Dozens of flowers can grow on one shrub. Blossoms measure about 6 to 8 inches (15 to 20 centimeters) across.

Peonies are valued as garden flowers. People also use peonies in floral arrangements.

Pepper

Peppers are the fruits of many different garden plants. They are eaten as vegetables and used to flavor foods. Garden peppers come from plants of the nightshade family, which also includes tomatoes, potatoes, and eggplant. The spice called black pepper comes from an unrelated plant.

Peppers are grown widely in the tropical parts of Asia and Central and South America. The first Europeans to visit the

Garden peppers come in many colors and flavors.

Americas carried pepper seeds back to Spain in 1493. From there the plants spread quickly throughout Europe.

Pepper plants reach 2 to 4 feet (0.6 to 1.2 meters) in height. The fruits differ in size, shape, and taste. When ripe, peppers range in color from yellow to deep red and purple.

Peppers can be mild or hot. Mild peppers are usually large. Bell, or sweet, peppers are mild peppers that are bell-shaped, wrinkled, and puffy. They are often used in salads and in cooked dishes. Bell peppers are rich in vitamins A and C. Paprika is a mild pepper that is usually made into a powder and used as a spice.

Hot peppers include tabasco, chili, and cayenne peppers. These peppers contain a substance called capsaicin, which gives them a strong, burning taste. Hot peppers are generally used as relishes or are ground into a fine powder for use as spices. Tabasco peppers are ground and mixed with vinegar to make a popular hot sauce.

Pequot

The Pequot are a Native American people of eastern Connecticut. In the 1600s the tribe was nearly wiped out by disease and war with English settlers.

The Pequot lived in wigwams, which were dome-shaped houses made from

A decorated Pequot canoe is displayed in a Connecticut museum.

wooden poles and bark. They grew corn and other crops. They also fished and hunted for deer and other animals.

Dutch and English settlers arrived in Pequot territory in the early 1600s. At first the Pequot got along with the settlers. Soon, though, many Pequot died from diseases brought by the settlers. And within a few years the Pequot and the English began fighting over land. In 1637 the English and other Native American groups attacked the main Pequot village in Connecticut. About 600 Pequot were killed.

After the war some Pequot tried to flee. Many were captured or killed by the English or other Indian tribes. The English sold some Pequot as slaves. They sent other Pequot to live with other tribes. Many of the Pequot were put under the control of the Mohegan. The Mohegan treated the Pequot so badly that the English had to separate the two groups in 1655. The English moved the Pequot to land along the Mystic River in Connecticut. At the end of the 20th

century there were about 1,300 Pequot in Connecticut.

Perseus

Perseus was a hero in ancient Greek mythology. He was the son of Zeus, the chief god. His mother was Princess Danaë.

According to legend, a king fell in love with Danaë. But he wanted to get rid of Perseus. So he tricked Perseus. He made Perseus promise to get the head of the evil monster named Medusa. Medusa was a Gorgon, a winged creature with snakes for hair. Anyone who dared to look at her turned to stone. The cruel king believed he would never see Perseus again.

In his quest to kill Medusa, Perseus received help from the gods. Hermes, the messenger god, guided him on his journey and gave him a magic sword. Athena, the goddess of wisdom, gave Perseus a bronze shield. Minor goddesses called nymphs gave him a helmet that made him invisible.

Perseus attacked Medusa while wearing the magic helmet. He also was careful not to look right at her. Instead, he looked only at her reflection in the polished shield. With one stroke of his sword he cut off Medusa's head. He then put the head in a bag. Perseus returned home and went to the king's palace. There he pulled out Medusa's

Persia

Persia was a mighty kingdom centered in what is now Iran. The Persians rose to power in about 550 BC. For about 200 years they ruled a vast empire. It stretched from the Indus River in southern Asia to parts of southern Europe and northern Africa.

After the fall of the empire, a number of peoples ruled Persia. The present-day country of Iran had its beginnings in the early 1500s. But the outside world called it Persia until 1935.

The Persian Empire

In about 550 BC Cyrus II became king of Persia. Over the next 40 years the Persians brought one region after another under their control. Persian kings treated the groups they conquered with fairness and respect. They allowed conquered peoples to follow their local customs.

In 522 BC Darius I became king. During his rule the Persian Empire grew to its greatest size and power. The empire was divided into 20 provinces. A governor ruled each of the provinces. The governors enjoyed a great deal of freedom in ruling. However, military forces in each province kept the governors from becoming too strong. Persian kings also

Persian kings built a hall called the Apadana in the city of Persepolis about 2,500 years ago. A stairway still stands. Carvings on it show a lion attacking a bull.

used spies to keep track of the governors' activities.

The Persians built a series of roads to increase communication and business activity throughout the empire. The most famous road was the Royal Road. The Royal Road stretched more than 1,500 miles (2,400 kilometers) west from the Persian capital of Susa.

Later Persia

In about 500 BC the Persian Empire slowly began to weaken. It suffered military defeats and rebellion. In the 300s BC a kingdom known as Macedonia had come to power in Greece. By 330 BC the Macedonian ruler Alexander the Great had conquered the Persians.

Persians known as the Parthians and the Sasanians ruled Persia from about 247 BC until the AD 600s. At that time Muslim Arabs invaded. The Persians became

Muslims but kept their own language, which is called Farsi or Persian. A ruling family from Persia called the Safavids regained control in the early 1500s. They called their country Iran.

Greece, Ancient • Iran • Persian Wars

Persian Gulf War

In 1990 an army from Iraq took over the country of Kuwait. In January 1991 the United Nations (UN) sent in armies from many countries to push out the Iraqis. The war they fought is called the Persian Gulf War. (Kuwait and Iraq lie on the Persian Gulf, a body of water in the Middle East.)

Background

Iraq needed money after fighting the Iran-Iraq War, which ended in 1988. Iraq's neighbor Kuwait was rich because it produced oil. To get control of Kuwait's oil, President Saddam Hussein of Iraq sent in troops on August 2, 1990. Kuwait fell quickly to the Iraqis.

General H. Norman Schwarzkopf gets U.S. troops ready to fight in the Persian Gulf War.

Almost every other country disapproved of what Iraq had done. On November 29 the UN threatened Iraq with military force unless it got out of Kuwait by January 15, 1991.

The United States and other countries thought that Iraq might also try to get the oil supply in Saudi Arabia. (Saudi Arabia is next to Kuwait and Iraq.) To shield Saudi Arabia, they sent forces there. This military buildup was called Operation Desert Shield.

By January 1991 there were about 700,000 troops in the Persian Gulf region ready to fight Iraq. These allied troops came from the United States, the United Kingdom, France, Canada, Australia, Egypt, Saudi Arabia, Syria, and several other countries. Meanwhile, Saddam Hussein ignored the UN's deadline. He built up his army in Kuwait to about 300,000 troops.

War

During the night of January 16–17, the Persian Gulf War began with a massive attack on Iraq by allied warplanes. This campaign was named Operation Desert Storm. A ground attack, called Operation Desert Saber, followed on February 23–24. Within just four days, Iraq's troops stopped fighting. Arab and U.S. forces easily recaptured Kuwait's capital. The war ended on February 27, 1991. About 300 allied soldiers and thousands of Iraqis died in the war.

Results

The UN had banned most trade with Iraq before the war. The ban remained

in force after the fighting ended. At the same time, the UN told Iraq that it must destroy many of its weapons. The UN sent inspectors to Iraq to make sure that the Iraqis destroyed the weapons. In about 1998, however, Iraq stopped cooperating with the inspectors. This and other disputes led to another war. Troops from the United States and other countries invaded Iraq in March 2003.

Persian Wars

By 500 BC Persia ruled a large empire that was centered in what is now Iran. The Persians had conquered a number of ancient Greek cities, called city-states, that lay along the eastern Mediterranean Sea. The city-states were independent of each other. But in about 499 BC they united in rebellion against their Persian rulers. This rebellion started the Persian Wars, a long series of battles between the Greeks and the Persians.

During the rebellion Athens sent 20 ships to help the Greek rebels. Athens was a powerful city-state on the Greek mainland. Despite the help from the Athenians, the rebels lost to the Persians.

The Persians vowed revenge against Athens for its part in the rebellion. In 490 BC a Persian army invaded mainland Greece. The Athenians faced the Persians in battle on the plain of Marathon,

An illustration shows a united force of Greeks (right) defeating the Persians in battle in 479 BC.

about 25 miles (40 kilometers) from Athens. Although there were fewer Athenians than Persians, the Athenian troops badly defeated the Persians.

Ten years later the Persians returned. This time both their army and navy were huge and powerful. One battle followed another. Finally, in 480 BC the Greeks defeated the Persians in a great sea battle in the Strait of Salamis. (The Strait of Salamis is a narrow body of water a few miles west of Athens.) Another Greek victory came the following year.

Smaller battles raged for the next 30 years, but the Persians never again conquered the Greeks. In 449 BC the Greeks and the Persians agreed to a final peace treaty. The Greek victory allowed Greek culture and political ideas to last long after the end of the Persian Empire.

Peru

The country of Peru sits on the west coast of South America. For hundreds of years the great Inca Empire ruled the land that is now Peru. The capital of Peru is Lima.

Geography

Peru shares borders with Ecuador, Colombia, Brazil, Bolivia, and Chile. The Pacific Ocean lies to the west.

The Andes Mountains run north and south through the center of the country. In southern Peru many of the mountains are volcanoes. Also in the south is Lake Titicaca, one of the world's highest lakes.

Low desert lands lie west of the Andes. East of the Andes is a large, humid region called the montaña. In the northeast several rivers flow out of the Andes to join the Amazon River. The area near the river is hot and rainy year-round.

© 2006 Encyclopædia Britannica, Inc.

Plants and Animals

A blue-and-yellow macaw shares a perch with five scarlet macaws in Peru. Macaws are birds that are closely related to parrots.

The dry coastal region and the mountains have few plants besides shrubs, cacti, and grasses. Llamas, alpacas, vicuñas, and guanacos—all relatives of the camel—live in the Andes.

Thick, tropical rain forests grow in the montaña. Parrots, monkeys, jaguars, and crocodiles live in the forests. The world's largest rodent, the capybara, also lives there.

People

About half of the population is American Indian. Mestizos, or people with both Indian and European roots, make up about a third of the population. Whites, mainly with Spanish roots, make up a small part of the population. They control most of Peru's power and money. There are also small groups of Japanese, Chinese, and others.

Most Peruvians live in cities and towns along the coast. However, many Indians live in the Andes or in the Amazon region. The Indians speak Quechua or Aymara. Other Peruvians speak Spanish. Roman Catholicism is the country's main religion.

Economy

Peru's natural resources are important to its economy. Peru has deposits of gold, copper, zinc, silver, lead, and iron ore. It also mines some petroleum (oil). Farmers in Peru grow sugarcane, rice, corn, cotton, and potatoes. They also raise sheep, cattle, pigs, goats, and chickens.

Many industries in Peru use the country's resources or farm products. For example, Peruvians make cloth from the wool of llamas, alpacas, and sheep. Factories also make food products, metals, clothing, and wood products.

History

More than 3,000 years ago several cultures developed in parts of what is now Peru. In the 1400s the Inca built a large empire along the west coast of South America.

Some valleys of the Andes have good farmland.

In 1533 the Spanish explorer Francisco Pizarro conquered the Inca Empire. Millions of Inca died. The Spanish grew rich from the land's gold and silver.

In 1821 a general from Argentina captured Lima and declared Peru independent from Spain. From 1879 to 1883 Peru fought a war with Chile.

Military leaders ruled Peru off and on until 1980. Alberto Fujimori became president in 1990. However, Peruvians accused him of illegal activities. He left the country in 2000.

Pet

Pets are animals that people keep mainly for enjoyment and companionship. Some pets also help or protect their owners. Pets need a lot of attention and care. However, they also add a lot of fun and happiness to their owners' lives.

Popular Pets

Cats and dogs have long been the most common pets. People tamed wild dogs thousands of years ago. Ancient Egyptians worshipped cats and even buried them with people. Today birds, fish, guinea pigs, hamsters, and snakes are also popular pets.

Working Pets

Some pets are more than just companions for people. Cats often help people by catching mice. Many dogs protect the home of their owner. Sled dogs carry people and goods across the snowy wilderness. Farm dogs may herd sheep or cows. Guide dogs go everywhere with their blind owners. People with other disabilities sometimes have animals to help them, too.

Many children keep dogs as pets.

Pet Care

Pets need almost as much care as children. They need food, water, and shelter. They need to be kept clean, and they need exercise. They should also be taken to an animal doctor, or veterinarian, on a regular basis. The veterinarian can help keep pets healthy by giving them shots to protect against certain diseases.

Wild Animals as Pets

Most of the animals that people keep as pets are tame. But sometimes people keep wild animals as pets. But these animals usually do better in their natural habitat. Some rare animals cannot survive at all if taken from the wild. Even if they do survive, wild animals rarely become completely tame. They need to be watched carefully.

When people try to obtain wild pets, animals suffer in many ways. People called poachers illegally hunt and trap them. Many baby animals die when they are taken from their mothers and shipped off to be sold as pets. Poachers hunt some kinds of animals until almost none of the animals are left.

Peter the Great

The Russian tsar, or emperor, Peter I is called Peter the Great because of his outstanding career as a ruler and reformer. He made Russia more modern and more powerful.

Peter the Great

Early Life

Peter was born on June 9, 1672, near Moscow, Russia. He was about 4 years old when his father died. Peter's half-brother Fyodor became tsar, but he died in 1682. Peter and another half-brother, Ivan, were then made tsars together. Ivan's sister Sophia ran the country while Peter grew up in a village outside Moscow.

Peter seized power from Sophia in 1689. In 1696 Ivan died, leaving Peter as Russia's only tsar.

Russian Expansion

At the beginning of Peter's reign, Russia covered a huge territory. However, it did not have good access to the sea. Peter wanted to change this. In 1700 Peter led Russia into war against Sweden, which controlled the Baltic Sea. During the war Peter built a new capital city, Saint

Petersburg, on land captured from Sweden. Russia won the war in 1721.

After the victory over Sweden, the Russian Empire was formed. Peter expanded the empire in a war against Persia in 1722–23. Russia won land around the Caspian Sea.

Reforms at Home

Peter also made many changes within Russia. He looked to western Europe for ideas. The countries there had already made some of the kinds of changes he wanted to make in Russia. In 1697 Peter traveled to Europe. He disguised himself and worked in shipyards in England and the Netherlands. He learned as much as he could about the West.

Peter brought Western ideas back to Russia. He made the government and the army more modern. He encouraged industry and trade. He built schools and hospitals. He even tried to make Russians look more Western by taxing people who wore beards and Asian clothing. Not everyone liked the changes. Peter died in Saint Petersburg on February 8, 1725.

Petroleum

Petroleum is another name for oil, a liquid found deep underground. Petroleum is a valuable natural resource. It is used to make many products that people use every day. These products include gasoline, paints, and even lip balm.

Did You Know?

The war between Russia and Sweden for control of the Baltic Sea is called the Great Northern War.

How Petroleum Formed

Petroleum formed from the remains of tiny plants and animals that lived hundreds of millions of years ago. When these living things died, they sank into mud. As layers of mud and rock piled up, they pushed down on the lower layers. Eventually this pressure and Earth's heat changed the plant and animal remains into petroleum.

Drilling and Refining

Underground, petroleum collects in reservoir rock. This is rock that has thousands of tiny holes in it. Sometimes reservoir rock has large, bowl-shaped spaces in it. These spaces trap huge amounts of petroleum near Earth's surface. Workers drill down to collect the petroleum from reservoir rock traps.

After workers pump the crude, or raw, petroleum from the ground, it goes to large factories called refineries. There the crude petroleum is refined, or cleaned, to make it ready to use.

A ship called a tanker unloads petroleum at a port in California.

Uses

People use refined petroleum to make many different products. Some parts of the petroleum go into fuels such as gasoline, diesel fuel, and jet fuel. Other parts are used to make waxes and greases such as petroleum jelly. Plastics, fertilizers, explosives, and certain drugs also come from refined petroleum.

Disadvantages of Petroleum

Burning fuel made from petroleum releases harmful gases into the air. These gases can mix with moisture to create acid rain, a dangerous form of pollution. Burning petroleum also helps to trap heat in Earth's atmosphere. This process is called global warming. It may harm plants and animals and cause ocean levels to rise.

In addition, the world has a limited supply of petroleum. It is called a nonrenewable resource because it cannot be replaced once it is removed from the ground. People are using up petroleum so fast that eventually the supply may be gone.

Pharaoh

The rulers of ancient Egypt were called pharaohs. The word pharaoh means "great house." It originally described the royal palace but later described the rulers themselves.

A huge statue of the pharaoh Ramses II stands at the temple of Luxor in Egypt.

Role

Pharaohs were absolute, or all-powerful, rulers. They made laws, controlled the land and its resources, and maintained an army. Assistants called viziers and other officials helped pharaohs to govern. Pharaohs were also religious leaders. In fact, Egyptians worshipped their pharaohs as gods.

Burial

When pharaohs died, their bodies were preserved as mummies. Egyptians then buried the mummies in tombs, sometimes in or under pyramids. They buried treasures along with the mummies. Egyptians believed that pharaohs lived on as gods in the afterlife.

Famous Pharaohs

One of the best-known pharaohs is Tutankhamen. He ruled in the 1300s BC, from about age 8 until he died 10 years

later. Archaeologists found his tomb in 1922. In addition to his mummy, there was a gold mask of the pharaoh's face, jewelry, furniture, weapons, and other treasures buried in the tomb.

In the 1200s BC Ramses II ruled as pharaoh for about 67 years. He fought many successful wars. He also ordered many temples and statues to be built. Giant statues of Ramses II survive in Egypt today.

Ancient Egypt also had some female pharaohs. Many of them ruled with their husbands or for their young sons. Hatshepsut, however, ruled on her own as a pharaoh in the 1400s BC. Cleopatra is probably the most famous woman ruler of Egypt. Part of a line of pharaohs from Macedonia, she ruled from 51 to 30 BC. After her death the Roman Empire took over Egypt, and the rule of the pharaohs ended.

city, 1,517,550;
(2007 estimate)
1,449,634

Philadelphia is the largest city in the state of Pennsylvania. It is also one of the largest cities in the United States. Philadelphia played a central role in the

Independence Hall is part of Independence National Historical Park in downtown Philadelphia, Pennsylvania.

country's early history. It was the capital of the United States from 1790 to 1800. The city lies where the Delaware and Schuylkill rivers meet.

Places of Interest

Two important U.S. historical documents—the Declaration of Independence and the U.S. Constitution—were created in Philadelphia's Independence Hall. The city is home to the Liberty Bell, a famous symbol of U.S. freedom. Philadelphia also has museums about the inventor, publisher, and political leader named Benjamin Franklin. He lived in the city for most of his life.

Economy

Philadelphia's economy is based mainly on services, including health care, education, trade, and communications. The city is a center of banking, scientific research, and business. Factories in Philadelphia make medicines, processed

foods, machinery, electronics, and metal products.

History

The Philadelphia area was once home to Delaware Indians. The area became part of the colony of Pennsylvania in 1681. William Penn, a leader of the Quaker religion, established the colony as a place of religious freedom. Penn founded Philadelphia in 1682. Its name is Greek for “the city of brotherly love.” Philadelphia soon grew into a major center of trade and industry.

Philadelphia played a special role in the American Revolution, which led to the creation of the United States. The Declaration of Independence was signed in Philadelphia on July 4, 1776. Eleven years later the U.S. Constitution was written in the city.

For many years Philadelphia was the center of U.S. politics, culture, and banking. However, in the 1800s it lost those roles to Washington, D.C., and New York City. Today Philadelphia remains a center of business, higher education, and the arts.

Philippines

The Republic of the Philippines is a country of Southeast Asia. It is made up of about 7,100 islands in the western Pacific Ocean. The capital is Manila.

Geography

The South China Sea lies to the west and north of the Philippines. The Philippine Sea is to the east. The country's nearest neighbors are Taiwan, Indonesia, and Malaysia.

Eleven large islands have more than nine tenths of the land. The two largest islands are Luzon in the north and Mindanao in the south. Most of the Philippine islands are mountainous. Mount Apo, on Mindanao, is the country's highest peak. Some of the mountains are active volcanoes.

The country has a hot and humid climate, with rainy and dry seasons. Earthquakes and typhoons (storms similar to hurricanes) are common.

Plants and Animals

The forests of the Philippines contain lauan (Philippine mahogany) and other trees. Mangrove swamps, grasses, flowering plants, and ferns also grow on the islands. Wildlife includes monkeys, deer, water buffalo, civet cats, bats, wild pigs, and poisonous cobras.

People

The people of the Philippines are called Filipinos. Nearly all Filipinos are Malay.

Their ancestors came from the Malay Peninsula in Southeast Asia. Some of the Malay also have Spanish or U.S. ancestors. There are small groups of Chinese and mixed Malay-Chinese. The original people of the islands, the Negritos, form a very small part of the population.

The population is also divided into groups based on language. The largest groups speak Tagalog, Cebuano, Ilocano, and Ilongo. Many Filipinos speak English and Filipino (a form of Tagalog) as second languages.

Most Filipinos are Roman Catholics. More than half of the people live in cities, mainly on Luzon Island.

Economy

Services and manufacturing are important parts of the economy. Services include transportation, health care, and

An active volcano called Mount Mayon rises above a field on the island of Luzon in the Philippines.

education. The country's industries make food products, electronics, clothing, chemicals, and wood products.

Farming is also important. Filipinos raise rice, corn, pigs, chickens, and goats for food. Crops sold to other countries include coconuts, sugarcane, bananas, and pineapples. Fishing is another source of food and money.

History

The ancestors of the Negrito people lived on the islands about 50,000 years ago. The Malay began arriving about 2,000 years ago from what are now Indonesia and Malaysia.

Spain took over the islands in the 1500s. In the late 1800s Filipinos began fighting for independence from Spain. Meanwhile, Spain fought the United States in

the Spanish-American War of 1898. After Spain lost the war, the United States took control of the Philippines.

The Filipinos fought against the United States but failed. The United States shaped the government, economy, and culture of the islands until the 1940s. The Japanese took over the islands during World War II. The Philippines gained full independence after the war, in 1946.

Ferdinand Marcos became president in 1965. Marcos used the military to help him rule the country. Corazon Aquino defeated Marcos in the presidential election of 1986. She returned democracy to the Philippines. However, the country continued to face problems in the economy and in the government. Plus, the Philippines faced two rebellions. Communist rebels wanted to overthrow the government. Muslim rebels wanted more power to govern themselves.

Philosophy

Raphael, an Italian painter of the 1500s, imagined a meeting of philosophers from all periods of history.

The word philosophy comes from the Greek language. It means “love of wisdom.” Philosophy is the study of some of the most basic questions about human life. For example, what can people really know about life? Or, are human beings basically good or evil?

There are many branches, or areas, of philosophy. Some branches deal with questions about reality and how people understand and experience it. Other branches deal with questions about how people behave and what is good or bad behavior.

Philosophers are people who study philosophy. They usually choose a particular branch of philosophy to study. The work of philosophers includes observing the world, doing experiments, and thinking. Philosophers may write books and articles on the issues that they study. They also may look at the ways other

philosophers have answered questions. Then they may agree or disagree with what these other philosophers have said.

Some of the most famous philosophers lived in ancient Greece more than 2,000 years ago. Socrates, Plato, and Aristotle were the most important ancient Greek philosophers. Philosophy was very important in the 1700s, too, during a time called the Enlightenment. The ideas of Enlightenment thinkers, who were called the philosophes, helped lead to the American and French revolutions.

Phnom Penh

Population
(2005
estimate), urban
area,
1,364,000

Phnom Penh is the capital of Cambodia, a country in Southeast Asia. It is the largest city in Cambodia by far.

Phnom Penh is a major river port and trading center. It is also Cambodia's main center of business and industry. Tourism also brings money to the city.

In 1434 the Khmer people built Phnom Penh to be the new capital of their king-

The Royal Palace in Phnom Penh, Cambodia, is built in the traditional Cambodian style.

dom. In 1865 the king of Cambodia made Phnom Penh the country's capital. The French ruled Cambodia from the city from 1886 until the 1950s.

Cambodia became an independent country in 1953. As its capital, Phnom Penh grew into a large center of culture and education.

In 1975 Communist rebels called the Khmer Rouge seized power in Cambodia. They forced most of Phnom Penh's citizens to work on farms in the countryside. The city lost almost all its people. The Khmer Rouge were forced out of power in 1979. Afterward Phnom Penh grew into a large city again.

Phoenicia

Phoenicia was an ancient region at the eastern end of the Mediterranean Sea. It

covered the land where the country of Lebanon is today. The people who lived there were called Phoenicians. They traded with many other peoples and set up many colonies.

The Phoenicians lived on the seacoast and made their living from the sea. They were skilled shipbuilders and navigators. Their trade routes reached as far as Spain and the British Isles. The Phoenicians traded wood, linen, dyes, and wine. They also carved wood and ivory and worked with metals and glass. The art of glassblowing was probably invented in Phoenicia.

The Phoenicians spoke a language that was similar to Hebrew. They had their own form of writing and an alphabet of 22 letters. The Phoenician alphabet was the source of the Greek alphabet and of the Latin alphabet, which most people use today.

A stone carving from the 1st century AD shows the kind of ship that the Phoenicians used on the Mediterranean Sea.

Historians think that the Phoenicians arrived in Phoenicia in about 3000 BC. They probably came from the region of the Persian Gulf, to the southeast. They built the cities of Sidon, Tyre, and Berot (modern Beirut). The Phoenicians set up colonies all around the Mediterranean. Carthage, in North Africa, was a very successful colony that became a power in its own right.

Over the centuries a number of foreign powers controlled all or parts of Phoenicia. They included Egypt, Assyria, Babylonia, and Persia. The Macedonians, led by Alexander the Great, conquered Phoenicia in 332 BC. In 64 BC Phoenicia became a part of the Roman Empire.

Phoenix

Population
(2000 census),
city, 1,321,045;
(2007 estimate)
1,552,259

Phoenix is the capital of the U.S. state of Arizona. It is one of the largest cities in

Giant saguaro cacti grow in the Tonto National Forest east of Phoenix, Arizona.

the United States. It lies on the Salt River within the Sonoran Desert. Mountains surround the city. Its warm, sunny climate has made it a popular vacation spot.

Many people in Phoenix work for the government. Many others work in tourism, health care, or other service industries. Factories in and around Phoenix make spacecraft, aircraft, electronics, and computer parts.

Phoenix lies in a dry area. The city developed as people were able to bring water there. In ancient times a Native American people called the Hohokam lived in the area. They dug canals from the Salt River to carry water to their crops.

In modern times there were no towns in the Phoenix area until the late 1800s. In 1867 a businessman named Jack Swilling built new water canals in the area. New farms were soon established there. Phoenix grew near the farms.

The capital of the Arizona Territory was moved to Phoenix in 1889. In 1912 Arizona became a U.S. state with Phoenix as its capital.

Roosevelt Dam was built on the Salt River in 1911. The dam allowed much more water to be brought to Phoenix. The city grew very quickly after that.

Photography

Using a camera to take photographs is called photography. A photograph is an image, or picture, that has been captured on film or some other material. People who take pictures are called photographers.

Uses of Photography

Photography is a useful form of communication. Photographs give information

about people, places, objects, and events that words may not be able to describe.

Newspapers and magazines have printed photographs of interesting people and events since the 1800s. Advertisers and other businesses use photography to show people their products. Scientists, doctors, and police officers use photography to record important information.

Photography is a form of art as well. Many museums and galleries display photographs created by artists.

Finally, photography is a very popular hobby. People take photographs of places they visit. They also photograph important family events, such as birthdays, holiday celebrations, graduations, and weddings.

Making Photographs

Photographers use cameras to take pictures. Traditional cameras use film to record images. Other cameras, called digital cameras, use computer chips.

Film is a thin, see-through material. It has a special coating that goes through chemical changes when light comes into the camera from the outside. These changes create the image. After taking pictures, the photographer takes the film out of the camera. Then the photographer treats the film with more chemicals. This process is called developing. It creates a photographic negative. On a negative, dark areas of the image are light and light areas are dark. Photographers create prints, or photographs, by passing light through the negative onto

A young photographer learns to develop photographs. The room she works in has special lighting because ordinary light would spoil the images on the film.

special paper. One negative can make many prints.

Digital cameras and cell phones do not use film. They turn images into electric signals, which they store on microchips. People can load images from a digital camera or a cell phone onto a computer. Then they may use their computer's printer to print the images. Or they may send the images to a company that can print them on special photograph paper.

Cameras have features that allow photographers to control how the image is created. One feature is the shutter, which controls the amount of light that enters the camera. A photographer can adjust the shutter to create certain effects with the light. Another feature is the lens, which focuses the light. One special type of lens allows the camera to capture a wider view than a regular lens would. Another lens can make objects far away look much closer than they are.

History

Louis Daguerre of France invented one of the earliest forms of photography in 1837. Daguerre's camera recorded images on metal plates. His photographs were called daguerreotypes. The main problem with daguerreotypes was that no copies could be made of the original image.

A few years after Daguerre's invention, British scientist William Henry Fox Talbot invented a way to produce paper negatives. This made it possible to print any number of photographs from a

A photographer prepares to photograph a woman in his studio in about 1900.

single negative. Photographers still use this method today.

Early photography was difficult because cameras were large and heavy. They recorded images on stiff plates instead of film. In the late 1800s the U.S. inventor George Eastman invented flexible film and a small, easy-to-use camera. Eastman's inventions made it possible for anyone to take photographs.

Before 1907, when color film was invented, camera film was black and white. Black-and-white film that developed itself appeared in 1947. This type of film was used in a special camera, called a Polaroid Land camera. The film came out of the camera after a picture was taken and revealed an image within minutes. Color Polaroid film became available in 1963. Digital cameras appeared in the 1990s.

Photosynthesis

Photosynthesis is the process in which green plants use sunlight to make their own food. Photosynthesis is necessary for life on Earth. Without it there would be no green plants, and without green plants there would be no animals.

Photosynthesis requires sunlight, chlorophyll, water, and carbon dioxide gas. Chlorophyll is a substance in all green plants, especially in the leaves. Plants take in water from the soil and carbon dioxide from the air.

Photosynthesis starts when chlorophyll absorbs energy from sunlight. Green plants use this light energy to change water and carbon dioxide into oxygen

and nutrients called sugars. The plants use some of the sugars and store the rest. The oxygen is released into the air.

Photosynthesis is very important because almost all living things depend on plants for food. Photosynthesis is also important because of the oxygen it produces. Humans and other animals need to breathe in oxygen to survive. Without photosynthesis, all Earth's oxygen would be used up.

Some living things other than plants also make their own food through photosynthesis. They include certain types of bacteria and algae.

Energy • Plant

Green plants such as trees use carbon dioxide, sunlight, and water to create sugars. Sugars provide the energy that makes plants grow. The process creates oxygen, which people and other animals breathe.

Physics

Physics is one of the major branches of science. People who work in physics are called physicists. Physicists study matter and the forces (pushes or pulls) that act on it. (Matter is what makes up all physical objects.) Physicists also study many different forms of energy. The objects that physicists study range in size from the tiny building blocks of matter to huge groups of stars.

Fields of Study

Physics is divided into many fields of study. Mechanics deals with the effect of forces on objects and the motions of objects. Acoustics is concerned with sound. Optics is the study of light. Thermodynamics deals with the form of energy called heat. Electronics and mag-

A young visitor to a science museum explores an electric spark generator. Museums can provide interesting ways to learn about physics.

netism are concerned with a basic property of matter called electric charge. Atomic physics concerns the structure of atoms (the building blocks of matter) and the forces that act on them. Quantum mechanics explains the behavior of very small particles—such as the particles that make up an atom.

History

Physics first developed as people began to wonder about the physical world around them. The ancient Greeks studied the motion of objects in the sky and the physical properties of things on Earth.

Early in the 1600s the Italian scientist Galileo studied how all things fall to Earth at the same speed. At the end of the 1600s the English scientist Isaac

Newton explained the laws of gravity (a force) and motion.

In the late 1800s scientists discovered that tiny particles make up atoms. In the early 1900s the German-American physicist Albert Einstein helped to explain the behavior of these particles. Einstein also proposed entirely new ways of thinking about space, time, and gravity.

Picasso, Pablo

Pablo Picasso experimented with many different styles of painting during his long career as an artist. His work was a

Picasso designed a steel sculpture for an outdoor site in Chicago, Illinois. The sculpture stands about 50 feet (15 meters) high.

major influence on the development of modern art. Picasso also created sculpture, prints, pottery, poetry, and ballet scenery.

Early Life

Pablo Ruiz y Picasso was born on October 25, 1881, in Málaga, Spain. He learned to draw from his father, a professional art teacher. Picasso held his first exhibition at age 13 and then studied at an art academy. But in 1899 he decided to break with his formal training and join a group of experimental artists.

Blue and Rose Periods

Picasso was deeply affected by the death of a close friend in 1901. He began painting images of death, poverty, and despair. He used mostly blue tones, so this part of his career is called his blue period.

Picasso moved to Paris in 1904. By 1905 he was painting in shades of rose, or pinkish red, and his subject matter was less sad. This rose period lasted until about 1907.

Cubism and Later Styles

With his painting *Les Femmes d'Alger* in 1907, Picasso touched new ground. It shows five nude women in flat, angled shapes. Two of their faces look like African masks. At the time many people found the painting shocking.

Picasso and another painter named Georges Braque then created a new

style of art called cubism. This style does not show people or objects in a realistic way. Instead the subjects are broken apart into many flat shapes. Several sides of the same subject might show at once.

Picasso later used more traditional painting styles and a less severe style of cubism. In 1937 he painted *Guernica*, which many consider his masterpiece. It shows images of suffering after the bombing of the town of Guernica during the Spanish Civil War. Picasso continued to work into his 90s. He died on April 8, 1973, in Mougins, France.

Pierce, Franklin

Franklin Pierce was the 14th president of the United States.

Franklin Pierce was president of the United States between 1853 and 1857. Slavery was then an important issue.

Did You Know?

Picasso designed costumes and scenery for five ballets performed by a Russian ballet company.

TIMELINE

Pierce is born in Hillsboro, New Hampshire.

November 23, 1804

Pierce is elected president.

1852

Pierce is elected to Congress.

1832

In the Gadsden Purchase, the United States gains land from Mexico.

1853

The United States tries to buy Cuba from Spain but fails.

1853

Pierce signs the Kansas-Nebraska Act, which leads to violence.

1854

Pierce dies in Concord, New Hampshire.

October 8, 1869

Early Life

Franklin Pierce was born on November 23, 1804, in Hillsboro, New Hampshire. His father, Benjamin Pierce, served as governor of that state. After graduating from Bowdoin College in Maine, Pierce studied law. He became a lawyer in 1827. In 1834 Pierce married Jane Means Appleton. They had three sons.

Political Career

Pierce entered the New Hampshire legislature in 1829. In 1832 he was elected to the U.S. House of Representatives. From 1837 to 1842 he served in the Senate. Pierce then practiced law in Concord, New Hampshire. During the Mexican War (1846–48) he served briefly as an officer.

By the 1850s both major political parties, the Democrats and the Whigs, were divided over the issue of slavery. In 1852 none of the best-known Democrats

could win enough support to become the party's presidential candidate. Pierce was not well known, but the Democrats eventually compromised by choosing him. Pierce defeated General Winfield Scott in the election.

Presidency

As president, Pierce focused on expanding U.S. territory. In 1853 he unsuccessfully tried to buy Cuba from Spain. In the same year, however, the United States bought almost 30,000 square miles (78,000 square kilometers) of land from Mexico in a deal called the Gadsden Purchase.

Pierce tried to satisfy both sides of the slavery debate. He appointed Northerners and Southerners to government posts. He also signed the Kansas-Nebraska Act in 1854. The act allowed the voters in the territories of Kansas and Nebraska to decide whether to allow slavery there. Violent clashes broke out

between proslavery and antislavery settlers in Kansas.

Because of the situation in Kansas, the Democrats chose another candidate for president in 1856. Pierce retired to Concord to practice law. He died there on October 8, 1869.

Pig

Pigs are stout, barrel-shaped mammals. Some kinds of pigs are wild, while others are domestic (raised by humans). Farmers raise domestic pigs for their

Piglets stay close to their mother.

meat, which is called pork, and their fat, which is called lard. The skin of pigs is made into leather. Their stiff hair is used for brush bristles.

Several different names are used to describe pigs. Both wild and domestic pigs are also called swine. Domestic pigs that weigh more than 120 pounds (50 kilograms) are called hogs. That term can also be used to describe wild or domestic pigs in general. Before giving birth a female pig is called a gilt. After her first litter she is called a sow.

Where Pigs Live

Domestic pigs live on every continent except Antarctica. Several types of wild pig are found in Europe, Asia, and Africa. They live in forests and grasslands. China has the world's largest population of domestic pigs, followed by the United States.

Physical Features

A pig has a bulky body with short legs. It has thick skin covered with a coat of stiff hairs. Pigs range in length from about 2 to 7 feet (0.6 to 2.1 meters) long. Domestic pigs can weigh as much as 700 pounds (320 kilograms). The largest wild pig, called the wild boar, is smaller.

A pig's snout ends in a flat, rounded disk. Pigs use their snout to find food in the ground and dig it out. Wild pigs have sharp tusks to dig with, too. They also use their tusks as a weapon to defend themselves. Domestic pigs do not have tusks, but they have tusklike teeth.

The bush pig is an African wild pig that is known for its long hair.

Behavior

In the wild, female pigs live together peacefully. But males fight, so they usually live alone. Wild pigs eat a wide variety of foods, including leaves, roots, fruit, reptiles, and rodents. Domestic pigs eat grains and food waste.

A female pig gives birth after a pregnancy of about four months. The average litter includes about 10 or 11 baby pigs, called piglets.

Mammal

Pigeon and Dove

The bird called the domestic pigeon is a familiar sight on city streets. It is only one species, or type, of pigeon. About 250 species of pigeons and doves are found around the world. These birds make up the scientific family Columbidae. Often the larger members of the family are called pigeons, and the smaller ones are called doves. But there is no clear distinction between the

names. For example, the traditional “dove of peace” is a white domestic pigeon.

Pigeons and doves are found nearly all over the world. They live in farmlands, woodlands, deserts, and cities.

Physical Features

These birds have plump bodies with short necks, small heads, and long wings. They range in length from about 6 to 33 inches (15 to 84 centimeters). Many of them are gray, brown, black, or white. They are strong fliers. On the ground a pigeon or dove struts about, bobbing its head up and down.

Behavior

Most pigeons and doves eat mainly seeds, which they pick up from the ground. Some types eat leaves or fruit.

Pigeons and doves are the only birds to feed their young a liquid called milk. Both parents produce the “milk” from a

gland in the throat. The parents typically stay together for as long as they live.

Relationship to Humans

Pigeons and doves have an excellent sense of direction. For thousands of years people have trained pigeons to carry messages over long distances. A trained bird can find its way home after being carried hundreds of miles away.

People also hunt pigeons and doves for sport. Hunters killed so many passenger pigeons that this type became extinct, or died out. The last one died in 1914. Since then people have tried to limit the numbers of birds hunted.

Pilgrimage

A journey to a holy place is called a pilgrimage. A person who makes such a journey is a pilgrim. Pilgrimages have been a part of the world’s major religions since ancient times.

People go on pilgrimages for many reasons. Some religions require or encourage believers to make a pilgrimage as an expression of faith. People may also journey to a shrine because they want a favor, such as a cure for an illness, from a saint or divine being. Others give thanks or ask to be forgiven for a wrong they have done.

The first Christian pilgrims traveled to Jerusalem, where Jesus died. Those first

The mourning dove is a common bird of North America.

Hindu pilgrims bathe in the Ganges River in India.

pilgrimages took place in the AD 100s. In later years, Muslims controlled Jerusalem, which often made the pilgrimages impossible. Christians started a series of wars known as the Crusades partly so that Christian pilgrims could again travel to Jerusalem.

Modern Christian pilgrimage sites have included places where people are thought to have seen visions of the Virgin Mary. They include Lourdes, France, and Fátima, Portugal.

Every follower of Islam who can manage the journey is required to make a pilgrimage to the holy city of Mecca, Saudi Arabia, where Muhammad was born. This pilgrimage is called the hajj. In Mecca the pilgrim must walk seven times around a sacred shrine called the Kabah and touch a black stone in one of its walls. Muslims believe that this stone

was given to Adam when he was forced out of the Garden of Eden.

In Hinduism, certain places are considered holy because of a connection with a historical event, a legendary person, or a god. Many Hindu pilgrimage sites lie along India's rivers, especially the Ganges. For Hindus, bathing in a holy river symbolizes the washing away of sin. A yearly bathing festival for hundreds of thousands of pilgrims takes place on the Ganges near Allahabad.

The pilgrimage centers of Buddhism are tied to the life of the Buddha. The most important pilgrimage site for Buddhists is Bodh Gaya, in northeastern India. This is where the Buddha is said to have become enlightened (or awakened to the truth about life). Most Buddhist countries now have their own shrines at which pilgrims gather.

Pima

The Pima are Native Americans who live in southern Arizona. They call themselves the Akimel O'odham. The Pima are related to the Tohono O'odham people. They are probably descendants of the ancient Hohokam Indians.

The Pima traditionally lived in round, one-room houses. The houses had pole frames and walls of grass and mud. The Pima were farmers who built canals (artificial waterways) to carry river water

Did You Know?

In ancient times Jewish men were expected to make pilgrimages to Jerusalem during three yearly festivals.

Pima women used curved sticks to play a game.

to their fields. They grew corn, squash, pumpkins, kidney beans, tobacco, and cotton. They gathered cactus fruits and other wild plants. They also fished and hunted small animals, including jackrabbits.

Spanish explorers arrived in the land of the Pima in the 1690s. The Spanish taught the tribe how to grow barley and wheat and how to raise sheep and cattle.

In 1853 the tribe's land became part of the United States. Then whites began settling there. They changed the direction of rivers to water their own fields. The Pima eventually lost much of their land. They kept one reservation on the Gila River and another on the Salt River. At the end of the 20th century there were about 8,500 Pima living in the United States. Most lived on the tribe's reservations in Arizona.

Pine

Pines are believed to be among the oldest trees on Earth. Some can live as long as 6,000 years. There are 90 species, or types, of pine. They are most common in the mountains.

Pines vary widely in size. Some are only a few feet tall. Others grow taller than 200 feet (61 meters). Pines have thin leaves that are called needles. Pines are evergreens, which means that they do not lose their leaves in autumn. Pines contain a liquid called resin. It fights infection. Pines burn easily because of their resin.

Pines belong to the group of trees called conifers, which means that they produce cones. Both male and female cones grow on a pine tree. Usually the male cones grow on the lower branches of the tree. Male cones are less than 1 inch (2.5 centimeters) long. They are smaller than the female cones. Female cones are usually called pinecones.

Pine trees grow in Tongass National Forest in Alaska.

In spring or early summer pollination occurs. In this process the male cone releases tiny grains called pollen. The pollen is then carried by the wind to the female cone. Over the next several years the female cone makes seeds. These seeds can become new plants.

Pine trees are a major source of timber. Their wood is used in construction and to make paper. The resin of pine trees is used to make paints, turpentine, and varnishes. Pine oil can be used as medicine.

Pineapple

A pineapple fruit rises out of a cluster of sword-shaped leaves.

Pineapples are sweet, juicy fruits. They grow on a plant with the scientific name *Ananas comosus*. *Ananas* means “excellent fruit” in an Indian language from South

America. Pineapples are native to warm regions of the Americas.

Pineapples now grow in tropical (warm) areas around the world. The leading producers of pineapples include Thailand, the Philippines, India, China, Brazil, and the U.S. state of Hawaii.

Pineapples grow on plants that have leaves shaped like long swords. The plants also have purple flowers and smaller leaves. As they grow, these flowers and leaves join together to form the pineapple fruit.

A ripe pineapple looks like a cactus. The outer peel is very tough. It has sections that look like eyes. Each “eye” is formed from one flower. A group of leaves grows out of the fruit’s top. These leaves are called the crown. The inside of the fruit is fleshy and yellow.

Some pineapple plants do not produce seeds. In such cases, new plants are grown from cuttings, or pieces of the plants. Farmers prepare for planting by laying a covering of heavy paper or plastic over the soil. Then they plant the cuttings through holes in the covering. The covering protects the young plants.

Pineapples can be eaten fresh or canned. In some areas people use them in baked desserts. Pineapple leaves contain a silky fiber. In the Philippines people weave the fiber into a delicate fabric called piña cloth.

Fruit

Did You Know?

Christopher Columbus and other early explorers found the pineapple growing in the West Indies.

Pioneer Life

Pioneers were men, women, and children who started new lives on the U.S. frontier in the 1800s. After a long journey from the East, they built simple homes and small farms. They often lived miles from any neighbors and worked hard every day to survive.

Moving Westward

Pioneers had different reasons for moving westward. Many settlers went west during the California gold rush of 1849. Others wanted a piece of free land, which the U.S. government began giving away in the 1860s. Some groups were looking for religious freedom. Many former slaves wanted to start a new life after the Civil War ended in 1865.

The trip west was difficult. Many pioneers traveled in covered wagons pulled by horses, mules, or oxen. They often followed well-worn paths such as the Oregon Trail or the Santa Fe Trail.

Pioneers on the prairies built houses out of sod if they could not find trees to use for wood.

Along the way, pioneers and Native Americans sometimes fought. Many pioneers died from accidents and disease. In 1869 railroads linked the East and West coasts. However, pioneers used the wagon trails until about 1880.

Pioneer Settlements

Early pioneers made houses out of sod, or bricks of dirt and prairie grass. Others lived in dugouts, or spaces dug out of a hillside or the ground. Still others made houses out of logs and mud. Most homes had dirt floors, a fireplace, and a chimney. The simple furniture was usually made of wood.

Towns developed only as more people settled in the area. This meant that pioneer families had to do everything on their own. They grew crops and raised farm animals for milk, eggs, and meat. In the winter they hunted and ate preserved food, including beans and grains. Pioneers also made their own clothes out of wool, flax, old cloth, and leather.

Pirate

Pirates are criminals who attack ships at sea. The most famous pirates sailed the seas from the late 1500s to the early 1800s. A common symbol of piracy was the Jolly Roger—a black flag with a white skull and crossbones.

Many of the ideas that people have about pirates have come from books and

Blackbeard was an English pirate of the early 1700s. His real name was Edward Teach.

movies. These tell of lives of adventure and buried treasure. The stories are a mix of fact and fiction. For example, there are many colorful stories about characters named Henry Morgan, Captain Kidd, and Blackbeard. The stories are mostly made up, but the characters were actual people, and they were pirates.

A Pirate's Life

Real pirates used ships that were small and swift. They could attack much larger, better-armed ships. Armed with swords and pistols, they went aboard the other ship. Pirates not only stole a ship's cargo—they also took the ship itself. Pirates sold the ships that they captured or made them into pirate ships. Sometimes pirates held the ship's passengers or crew for ransom. This means that

they demanded money before they would release their captives.

Some pirate crews obeyed strict rules on their ships. Death could be the punishment for stealing another man's share of the loot. Women were not allowed on board pirate ships. However, there were some women pirates. They disguised themselves as men in order to join pirate crews.

History

In ancient times pirates from Phoenicia, Greece, and Rome threatened ships in the Mediterranean Sea. About a thousand years ago some of the Viking warriors in northern Europe committed piracy.

Pirates are now criminals throughout the world. However, there was once a legal form of piracy called privateering. Privateers were privately owned ships that had a government's permission to attack an enemy's cargo ships. The privateer's owners and crew got to keep the cargo they captured.

During the 1500s many Spanish ships carried treasure from Mexico back to Europe through the Caribbean Sea. They were attacked by pirates and by privateers such as the Englishman Sir Francis Drake. Caribbean pirates of the 1600s were known as buccaneers.

In the Mediterranean Sea, dangerous pirates received support from countries along the Barbary Coast of North Africa. These countries were called pirate states. The British, French, and U.S.

Did You Know?

Buccaneers were originally French, Dutch, and English sailors, many of whom had left their countries to escape the law.

navies ended piracy in this region in the early 1800s.

Piracy and privateering decreased in the 1800s and 1900s, but it still exists. For example, pirate attacks are still a threat to shipping in the South China Sea and off the northern coast of Africa near Somalia. Modern pirates do not sail the seas on pirate ships. Instead they attack from the coast using speedboats and small gunboats.

Pitcher Plant

Pitcher plants have special leaves that they use to trap insects.

Most plants get the nutrients that they need from soil. Pitcher plants also get nutrients by catching and digesting insects. For this reason they are called carnivorous, or meat-eating, plants.

There are several different species, or kinds, of pitcher plant. Some are related to the Venus's-flytrap, another carnivorous plant. Many types of pitcher plant grow in North and South America, but some species grow in other parts of the world.

Pitcher plants have structures shaped like pitchers, bowls, or trumpets. In some types the structures make up the whole of the plant's leaves. In other types the structures are just part of the leaves. In these types the structures grow at the ends of stringlike parts called tendrils. The purple, or common, pitcher plant has green to reddish leaves and purple-red flowers. The yellow, or trumpet, pitcher plant has green, trumpet-shaped leaves and bright yellow flowers.

Most types of pitcher plant catch and digest prey in a similar way. Glands in a plant's pitcher produce nectar. Nectar is a sweet, sometimes sticky liquid that attracts insects. Once an insect crawls into the pitcher, it falls into a pool of enzymes, or digestive juices. These enzymes dissolve the insect's soft parts. The plant then absorbs the soft parts through the walls of the pitcher.

Pizarro, Francisco

Francisco Pizarro was a Spanish explorer and adventurer. He conquered the Inca, who had established an advanced

Francisco Pizarro

civilization in South America. Pizarro also founded the city of Lima, now the capital of the South American country Peru.

Francisco Pizarro was born in Trujillo, Spain, in about 1475. His father was an army captain. As a young man Pizarro explored Central America.

Pizarro heard stories of a large and wealthy empire in South America. In 1523 he made a plan to take the Inca lands for Spain. Few people believed he could succeed. Early expeditions failed, but in 1531 he reached the lands of the Inca in what is now Peru.

On November 15, 1531, Pizarro and his men entered the Inca city of Cajamarca. The Spaniards had better weapons and easily defeated the Incas. Pizarro and his men took gold and silver from the Inca

and killed their emperor. Pizarro went on to take control of all of Peru.

In 1535 Pizarro founded the city of Lima. The city was the center of Pizarro's new government. But there was trouble between Pizarro and another Spaniard named Diego de Almagro. Almagro's followers killed Pizarro on June 26, 1541.

Plague

In the 1300s a disease called the plague killed about 25 million people in Europe. The plague became known as the Black Death because of the black patches that appeared on a victim's skin. Today people commonly use the word plague in two ways. They use it to refer to the disease itself. They also use it to mean a large outbreak of any dangerous disease. In the second case "plague" has the same meaning as the word epidemic.

An old illustration shows a doctor visiting a patient infected with the plague.

Did You Know?

Rats traveling aboard ships have spread plague to all areas of the world.

Plague is caused by tiny living things called bacteria. It is mostly a disease of rats. Fleas that bite infected rats pick up the plague bacteria. They then spread it to other rats or to people through bites. Infected people sometimes spread the disease to others when they cough.

Once inside a person's body, the plague bacteria enter the bloodstream. They travel to the liver, spleen, kidneys, lungs, and brain. Fever, weakness, headache, and shaking chills quickly develop. The most common form of plague, called bubonic plague, also causes swelling in a person's lymph nodes. (The lymph nodes help to protect the body from disease.) Swollen nodes are called buboes, which is why this form is called bubonic plague. Pneumonic plague mostly infects the lungs. Septicemic plague mainly infects the bloodstream.

Outbreaks of the plague are now rare. Because cities are cleaner than they used to be, there are fewer infected rats and fleas to spread the disease.

Planets

Planets are large natural objects that orbit, or travel around, stars. Eight planets orbit the star called the sun. In order from the closest to the sun, these planets are Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, and Neptune. The solar system is the collection of the sun

and the objects that orbit around it, including the eight planets.

Planets differ from other objects such as comets, asteroids, and meteors. In general, planets are the largest objects in the solar system after the sun. Most of them orbit the sun in a path shaped like a circle. They also have an atmosphere, or a layer of gases surrounding them. Most of the planets have at least one moon.

However, scientists have long debated what makes a planet a planet. For many years most people believed that there were nine planets in the solar system. This number included Pluto, which was discovered in 1930. Pluto is a planetlike object that is usually beyond Neptune. But Pluto orbits the sun in a different way than the eight planets do. Pluto's orbit overlaps the orbit of Neptune. Also, Pluto is much smaller than the eight planets. In 2006 a large group of scientists decided to make a new category for Pluto and similar objects in the solar system. They called the objects dwarf planets.

Types of Planets

There are two main types of planets in the solar system. The four planets nearest the sun—Mercury, Venus, Earth, and Mars—are called inner planets. They are rocky planets about the size of Earth or somewhat smaller. Jupiter, Saturn, Uranus, and Neptune are called gas giants. They are made up mostly of gases and have no solid surfaces. They are all much larger than Earth. Also, the gas giants each have many moons and a system of

Mercury, Venus, Earth, and Mars are rocky planets. They are closer to the sun than Jupiter, Saturn, Uranus, and Neptune, which are gas giant planets.

rings. Saturn's rings are the largest and best known.

Motion

Planets move in two ways. Each planet travels around the sun in a path called an orbit. The time it takes a planet to complete one orbit is equal to a year on that planet. For example, Earth completes one orbit every 365 days, so a year on Earth is that long.

Each planet also rotates, or spins about its center. As the planet spins, it turns different sides toward and then away from the sun. In one day, a person on the planet would see the sun appear overhead, then set, then rise overhead again.

On most planets, a day is roughly equal to the time it takes the planet to complete one rotation. For example, Earth completes one rotation in about 24 hours, and a day on Earth lasts 24

hours. Mercury and Venus are different because they spin slowly. By the time they complete one rotation, they have traveled very far in their orbit. A different part of the planet is then facing the sun. Therefore their day is not yet complete. It takes much longer for the same part of the planet to face the sun again.

Other Planets

In the 1900s scientists began to discover planets outside the solar system. These planets orbit around stars other than the sun. It is difficult to tell much about such planets because they are so far away. Scientists can find them by looking for certain tiny changes in the position and light of stars. These changes occur when a planet travels around a star.

Plankton

Countless tiny living things float and drift in the world's oceans and other bodies of water. These living things, or organisms, are known as plankton. They include plants, animals, and other kinds of organisms. Plankton have an important place in the food chain that supports fish and other sea creatures—and the people who eat them.

Types of Plankton

Plankton that is made up of plants or plantlike organisms is called phytoplankton. These organisms are often no larger than a single cell. For example, a single-celled type of algae, called a diatom, is a common form of phytoplankton. Phytoplankton floats near the surface of the water. Like other plants it uses sunlight to produce energy and then releases the gas oxygen. This process is called photosynthesis.

Plankton that is made up of animals or animal-like organisms is called zooplankton. Some of these organisms,

such as miniature crustaceans and protozoans, are very small. Others, such as jellyfish, are larger. Some fishes and shellfish begin their lives as eggs or tiny larvae. These eggs and larvae are also zooplankton.

Besides phytoplankton and zooplankton, bacteria and fungi float in the world's waters. These living things may also be considered plankton.

Importance

Plankton is very important to life on Earth. Phytoplankton produces much of the oxygen that people and animals need to survive. Plankton is also a major source of food. Zooplankton feeds on phytoplankton. In turn, fish and other larger animals eat the zooplankton. Many types of whale feed on zooplankton. The huge whales catch the tiny plankton by using a series of filters, called baleen, in their mouths.

Algae • Crustacean • Food Chain
• Photosynthesis • Protozoan

An almost transparent zooplankton is seen in an enlarged view.

Plant

Hundreds of thousands of different species, or kinds, of plant grow on Earth. Some plants are so tiny that people can hardly see them. Others are trees that grow as tall as skyscrapers.

Most plants have several things in common. They need sunshine, water, and air to grow. They are not able to move around. Their cells have stiff walls made of a tough material called cellulose. All

green plants use the sun's energy, water, and a gas called carbon dioxide to make their own food. This process is called photosynthesis.

Where Plants Grow

Plants grow nearly everywhere on Earth. Most plants grow in soil. They get the water and nutrients they need from the soil. But some plants do not need soil. Plants called epiphytes grow on hard surfaces, such as other plants or rocks. They get most of the water and nutrients they need from rain and the air. Still other plants float in water. A few species of plant live on and get their nutrients from other plants.

Types

All plants belong to one of two main groups, vascular plants and nonvascular plants. Vascular plants have special tissues, called xylem and phloem, that carry water and food throughout the plant. Vascular plants also have roots, stems, and leaves. Vascular plants include herbaceous plants, shrubs, and trees. Herbaceous plants have soft stems. Shrubs and trees have woody stems.

Nonvascular plants do not have xylem or phloem. They also lack true roots, stems, and leaves. Nonvascular plants include mosses, liverworts, and hornworts. They are generally small and grow in moist places.

Reproduction

Plants reproduce, or make more of their kind, either by seeds or spores. Seeds and spores are small structures that

Most plants grow flowers of some kind. The flowers are where the plant produces its seeds.

develop on plants and then fall off. They then may grow into new plants. Seeds are larger and more complex than spores.

Most vascular plants reproduce by seeds. Most seed-bearing plants grow flowers. Fruits grow from the flowers, and seeds grow inside the fruits.

Other vascular plants do not grow flowers or fruits. For example, the plants

Plants called conifers have cones that contain the plant's seeds.

How a plant grows from a seed

A bean is the seed of a bean plant. When the seed germinates, or starts to grow, small parts inside the seed grow into the root and stem. Most of the seed is used for food by the young plant. When the plant grows green leaves it begins to make its own food by photosynthesis.

called conifers form their seeds inside cones. Conifers include pines, spruces, firs, and similar trees and shrubs.

Nonvascular plants reproduce by spores. A few kinds of vascular plants, such as ferns, also reproduce by spores.

Sometimes plants can reproduce without spores or seeds. Stems, leaves, or other parts of a plant may grow into new plants. For instance, strawberry plants grow runners, or stems that creep along the ground. These stems may form roots and grow into new plants.

Importance

Without plants, no other living thing could survive. Plants provide food for

people and animals. They also make the oxygen that other living things breathe. They produce the oxygen as part of the process of photosynthesis.

Human beings use plants in countless ways. They get many foods, drinks, and flavorings from plants. They build homes from wood and many other parts of plants. People also burn wood for heat and energy.

Many of the fibers used to make cloth come from plants, especially cotton. A type of cloth called linen is made from the flax plant. Other useful things made from plants include medicines, paper, chewing gum, cork, rubber, and cocoa butter.

People also use flowers for decoration. They plant trees and flowers in their yards and in large formal gardens.

Plastic

Women sort plastic containers for recycling.

A plastic is a kind of material that is made by people and can be formed into almost any shape. Most plastics are strong, long-lasting, and lightweight. They resist damage by water, heat, chemicals, and electricity. In addition, plastics can be made in many colors.

Plastics have countless uses. Manufacturers often use plastics in place of more expensive materials. In nylon stockings, for example, plastic takes the place of silk. In vinyl house siding, plastic takes

the place of wood. In many automobile parts, plastic takes the place of metal.

Making Plastics

Most plastics are made from chemicals that come from petroleum (oil), natural gas, or coal. Heating these chemicals causes them to break down into molecules. (Molecules are groups of two or more atoms, which are the tiny building blocks of everything.) Scientists then join these molecules into chains. These chains make up plastics. Different combinations of molecules form different kinds of plastic.

Plastics can be made into almost any shape by heating them at a high temperature. The heat softens the plastic, which can then be poured into a mold. As the plastic cools, it hardens. When reheated, some types of plastic will soften again. The plastic can then be made into new shapes. Other types of plastic will stay hard even when reheated.

History

In 1869 John Wesley Hyatt, a U.S. inventor, made the first plastic. He called it celluloid because he made it from a plant material called cellulose. In 1909 a U.S. chemist named Leo H. Baekeland developed the first plastic made completely from synthetic (human-made) materials. Baekeland named the new material Bakelite. Scientists have developed many more plastics since then.

Did You Know?

Some plastics can be recycled by being ground up and made into such products as plastic lumber and filler for down jackets and sleeping bags.

Plate Tectonics

The theory, or idea, of plate tectonics says that Earth's outer layer, or crust, is made up of large, moving pieces called plates. All of Earth's land and water sit on these plates. Under the plates is a layer of melted rock called magma. The plates float on top of the magma.

Plate Movements

As the plates move they come into contact with each other. One of three things happens at these plate boundaries. First, the plates may move past each other in opposite directions. Second, the plates may crash into each other. In this case the edge of one plate may slide under another plate and be destroyed. Or the two edges of the plates may rise up and form mountains. Third, magma may rise to the surface and force the plates to move apart. As the rising magma cools, it hardens to create new crust.

Earthquakes and volcanoes often happen along plate edges. Many happen around the plate under the Pacific Ocean.

Continental Drift

The plates have moved across Earth's surface for hundreds of millions of years. As the plates move, the continents on them move, too. This movement is called continental drift.

Scientists think that all the continents were once joined together in one big continent. This supercontinent, called Pangaea, had formed by about 250 million years ago. Pangaea lay across a plate

boundary. Slowly, Pangaea broke apart at this boundary. Rising magma filled in the space, which eventually became the floor of the Atlantic Ocean.

One piece of Pangaea included parts of what are now North America, Europe, and Asia. This piece, called Laurasia,

The plates that make up Earth's crust are all different shapes and sizes.

drifted north. The other piece of Pangaea included parts of what are now Antarctica, Africa, South America, and Australia. This part, called Gondwanaland, drifted south. Eventually Laurasia and Gondwanaland broke apart, too. The continents then slowly moved to the places they are now.

The continents continue to move today. Scientists believe that in about 250 million years they will join together again.

Platypus

The platypus is an unusual mammal of eastern Australia and Tasmania. The

platypus and its relatives the echidnas are the only mammals that lay eggs. The platypus also looks odd. It has a “bill” and webbed feet like a duck and a flat tail like a beaver. The platypus is sometimes called a duckbill. Its scientific name is *Ornithorhynchus anatinus*.

The platypus has a squat body with short legs. It is about 15 to 24 inches (38 to 60 centimeters) long, including the tail. It has thick brown fur. Its eyes, ears, and nostrils close underwater.

Male platypuses have a sharp spur on each back foot. The spurs are connected to glands that make poison. The males use their spurs to fight each other, especially during mating season. The poison can cause great pain.

Did You Know?

When European scientists first saw stuffed platypuses, they thought they were fake. They changed their minds only after seeing live platypuses.

The platypus uses its strong front limbs for swimming as well as for digging.

The platypus lives in and near rivers and lakes. It eats insects, worms, shellfish, fish, frogs, mollusks, and tadpoles. The amount of food it eats every day is almost equal to its own weight.

About two weeks after mating, a female platypus lays one to three eggs. The babies hatch about 6 to 10 days later. Like other mammals, the mother feeds her babies with milk.

Plum

Plums are small fruits that may be sweet or tart. People have eaten them since ancient times. Some grow on trees that are also valued for their beauty.

There are many varieties of plum. They grow in Europe, Asia, and North America. The leading producers of plums are China, the United States, Germany, and Romania. Most of the plums grown in the United States come from California.

Plums grow on trees and shrubs. These plants come in many sizes, shapes, and colors. Some shrubs are only 3 feet (1 meter) tall. Certain trees can be 33 feet (10 meters) high. Their leaves may be green, green with red or purple, or red-dish purple.

Most plum trees have thorny twigs. These twigs are called spurs. Groups of flowers grow on the spurs. They may be white, pink, or red. The flowers develop into the fruits, or plums.

Some plums are as small as a cherry. Others are larger than a hen's egg. Their skin may be yellow, green, red, or dark purple. Sometimes the skin has a whitish coating. At the center of the fruit is a

Plums are popular fruits that are eaten fresh or baked into pies and pastries.

hard stone, or pit. Inside the pit is a seed. Cherries, peaches, and apricots are other fruits that have pits.

Many people eat plums fresh. The fruits are also made into jams, pastries, and drinks. Some types of plums are dried to make prunes.

Pluto

Pluto was considered the smallest planet in the solar system until 2006. In that year a large group of scientists decided that Pluto was not a true planet. They voted to call Pluto a dwarf planet instead. Pluto is very far from Earth. It is difficult to observe from Earth, even with the most powerful telescopes.

Pluto orbits, or travels around, the sun at an average distance of about 3.6 billion miles (5.9 billion kilometers). It is usually farther from the sun than the planet Neptune. However, Pluto's path around the sun is shaped like an oval, not a circle. Its distance from the sun varies greatly as it orbits. About every 228 years Pluto's orbit takes it closer to the sun than Neptune. This last occurred from 1979 to 1999.

Pluto's oval orbit, small size, and other unusual features make it unlike the eight planets. In the 1990s scientists discovered a ring of millions of small, icy objects. These objects orbit the sun beyond Neptune. Pluto seems to be similar to some of them.

Pluto is very difficult to photograph clearly because it is so small and so far away.

Physical Features

Pluto's diameter, or distance through its center, is about 1,430 miles (2,300 kilometers). This is less than half the diameter of the smallest planet, Mercury.

Scientists think that Pluto consists of rocky material and frozen gases. Some areas of Pluto's surface are very bright, while others are dark. The bright regions are probably a frozen gas called nitrogen.

Pluto is so far from the sun that it receives only a little sunlight. Scientists believe that the average temperature on its surface is about -387°F (-233°C).

Orbit and Spin

Like the planets, Pluto has two types of motion: orbit and spin. Pluto completes one orbit around the sun every 248 Earth years. That means that a year on Pluto lasts 248 Earth years. Pluto spins about its center slowly. It completes one rotation in about 6.5 Earth days, so a Pluto day lasts about 6.5 Earth days.

Pluto is tilted so that it spins nearly on its side.

Moons

Pluto has three known moons: Charon, Nix, and Hydra. Pluto and Charon are closer in size than any of the planets and their moons.

Observation and Exploration

In 1930 U.S. astronomer Clyde Tom-
baugh discovered Pluto with the use of a telescope. Scientists believed that Pluto was the ninth planet in the solar system. In 2006 the United States launched a spacecraft, called New Horizons, to explore Pluto. The journey to Pluto was expected to take about nine years. Later in 2006 scientists decided that Pluto should be called a dwarf planet rather than a planet. This brought the number of planets down from nine to eight.

Plymouth Colony

Plymouth Colony was the first lasting English settlement in New England. It was located on the site of the modern-day city of Plymouth, Massachusetts. The city lies on Plymouth Bay, 37 miles (60 kilometers) southeast of Boston.

An old picture shows the landing of the Pilgrims at Plymouth Rock.

Plymouth was founded by people called Puritans. The Puritans were an English religious group that practiced a strict form of Protestant Christianity. They disagreed with some practices of the Church of England. Some Puritans were called Separatists because they wanted to separate themselves from the Church of England. The Separatists who left England and founded Plymouth are now known as the Pilgrims.

The Pilgrims crossed the Atlantic Ocean on a ship called the *Mayflower*. They reached Cape Cod in November 1620. It took them until December 21 to decide where to settle. They named the chosen site Plymouth because the *Mayflower's* voyage had started in Plymouth, England. According to tradition, the Pilgrims landed on Plymouth Rock on December 26.

Winter had already set in when the Pilgrims landed. They were short of food. Many became ill. More than half the Pilgrims did not survive the first winter. The Pilgrims who did survive got help

Did You Know?

Pluto is only about two-thirds as large as Earth's moon.

from Native Americans who lived nearby. The Wampanoag people taught the Pilgrims how to plant crops, fish, and hunt.

Between 1630 and 1640 the Plymouth colonists made a good living by trading with the new Massachusetts Bay Colony. In 1691 Plymouth Colony became a part of the Massachusetts Bay Colony.

Pneumonia

Pneumonia is an inflammation, or swelling, of tissue in the lungs. An infection usually causes this inflammation. Pneumonia makes breathing difficult and even painful.

The main symptoms, or signs, of pneumonia are coughing, fever, chest pain, and shortness of breath. People with

Doctors find pneumonia by looking at chest X-rays. The lung at left is infected.

pneumonia may also have headaches, sweating, and confusion.

Pneumonia is not a single disease. Many things, including bacteria, viruses, and fungi, can infect the lungs and cause pneumonia. The infection can spread to others when the infected person coughs or sneezes.

Substances called vaccines can prevent some forms of pneumonia. Washing one's hands may also help to stop infections that lead to pneumonia. In addition, people should always cover their mouth when sneezing or coughing.

Treatment for pneumonia includes taking medicines that fight the infection and getting plenty of rest. Some people with pneumonia may need to go to a hospital for drugs and extra oxygen. With medical treatment, most people recover from pneumonia within a few weeks.

Pocahontas

Pocahontas may be the most famous Native American in history. She helped to make peace between Native Americans and the English colonists of Jamestown, Virginia.

Pocahontas was born in about 1595. Her father, Powhatan, was a powerful Indian leader. Pocahontas was about 12 years old when she first met the colonists. The English leader John Smith

Did You Know?

Viruses cause about half of all cases of pneumonia.

Pocahontas

later claimed that young Pocahontas saved his life. Smith said that Powhatan's men took him prisoner and were going to kill him. But Pocahontas got her father to free him.

The story has become part of American folklore, but it may not be true. Smith liked to tell tales. Nevertheless, Pocahontas was helpful. She brought food to the settlers as their supply ran low. She also warned them of possible Indian attacks.

Smith returned to England in 1609. Relations between the settlers and Powhatan grew worse. Pocahontas probably stopped visiting her English friends.

In 1613 an English sailor took Pocahontas prisoner. The sailor hoped that Powhatan would release some English prisoners in return for Pocahontas. He took Pocahontas to Jamestown. The colonists taught her Christianity. In 1614 Pocahontas married a colonist named John Rolfe. The wedding began

eight years of peace between the Native Americans and the colonists.

In 1616 the Rolfe sailed to England. The king and queen welcomed Pocahontas. But while in England Pocahontas caught the disease smallpox. She died in Gravesend, England, in March 1617.

Podgorica

Population
(2007 estimate)
174,000

Podgorica is the capital of Montenegro. The city is located in the southern part of the country, on a plain surrounded by mountains.

Although it is a very old city most of the buildings in Podgorica are less than 100 years old. Much of the city was destroyed during World War II (1939–45). Only a clocktower, a mosque, and a few houses survived. Today Podgorica is a modern city that is home to several art galleries, theaters, and museums.

Podgorica's economy is based on services such as banking, government, and telecommunications. Factories process aluminum and produce medicines.

The earliest records for the city show that the site was a caravan stop during ancient times. The city was first called Podgorica in 1326. In 1474 it became part of the Turkish Ottoman Empire. Four hundred years later Podgorica was awarded to Montenegro after a war between Turkey and several states, including Montenegro.

The city was occupied by Austria during World War I (1914–18). After the war Montenegro became part of the Kingdom of Serbs, Croats, and Slovenes. That later became Yugoslavia.

Podgorica suffered major damage during World War II. After that war the city was renamed Titograd in honor of Josip Broz Tito. Tito was the Communist leader of Yugoslavia from 1945 to 1980. After the collapse of Communism in 1992 the city once again became Podgorica. When Montenegro became an independent country in 2006 Podgorica remained its capital.

Poetry

Poetry is a type of literature, or artistic writing, that attempts to stir a reader's imagination or emotions. The poet does this by carefully choosing and arranging language for its meaning, sound, and rhythm. Poetry has many forms and styles. Poems may tell a story or express feelings. They may be serious or funny.

One thing that makes poems different from other types of writing is their structure. The words of a poem are arranged in lines and groups of lines, called stanzas. For example, here is the first stanza of the poem “From a Railway Carriage,” about an exciting train ride, by Robert Louis Stevenson:

Faster than fairies, faster than witches,
Bridges and houses, hedges and
ditches;
And charging along like troops in a
battle,
All through the meadows the horses
and cattle:
All of the sights of the hill and the
plain
Fly as thick as driving rain;
And ever again, in the wink of an eye
Painted stations whistle by.

Rhythm

Poets use patterns of rhythm to create various effects. Some syllables, or parts of words, in a line receive more emphasis, or stress, than others. For example, in the phrase “hedges and ditches,” the “hedg” and “ditch” sounds are stressed more than the other sounds. The stressing of certain syllables creates a rhythm. A poem's rhythm is called its meter.

Sound

Poets also use patterns of sound. Some poems rhyme, or use two or more words that end with the same sound, such as “hat” and “bat.” A poem may repeat sounds in many other ways. For example, in “high as a kite,” the long “i” sound is repeated. In “a stroke of luck,” the “k” sound is repeated. A group of

Did You Know?

The words of songs can sometimes be studied as poetry.

words can also start with the same sound, as in “a dark and dangerous day.”

Form

Some poems follow strict patterns of meter, sound, and length. For instance, the sonnet is a form of poetry that consists of 14 lines of 10 syllables each. It also follows a set pattern of rhythm and rhyme. Haiku is a form of poetry with three lines. Each line has a fixed number of syllables: five syllables in the first and third lines and seven syllables in the second line.

Some poems do not use any set form. Instead they use rhythms that are closer to those of everyday speech. These poems are known as free verse. However, the poet may still carefully arrange the sounds and rhythm.

Literature • Nursery Rhyme • Writing

Poison

A poison is a substance that causes harm when it enters the body or touches the skin. Certain household cleaners are poisons. Parts of certain plants are poisons. The venoms in certain snakes, spiders, insects, fish, and other animals are poisons. Foods that have spoiled also may have poisons in them.

Some poisons, such as the oil on the leaves of poison ivy, cause rashes or pain. Other poisons, such as those in certain molds and mushrooms, cause serious illness or death.

The skull-and-crossbones symbol is often used as a warning that something is poisonous.

Some poisons can harm people in seconds. Others can build up over days, weeks, or months and then harm people. For example, a person feels the sting of a poisonous scorpion right away. But if a person regularly breathes in paint dust that has lead in it, the lead will gradually build up in the body. The damage will happen slowly.

A person who thinks someone has been poisoned should immediately telephone a poison control center or emergency call center. The person should be ready to explain what happened and wait for instructions. Doctors can treat many types of poisoning.

Still, people should learn to identify poisons in order to prevent poisoning. It is especially important to keep medicines, household cleaners, and other poisonous substances out of the reach of children.

Food Poisoning

Poland

The Republic of Poland is a country in eastern Europe. The outline of Poland often changed during its history. At times it did not exist at all when foreign powers took control of the land. In the late 20th century Poland led the fight against Communism, a strict form of government, in eastern Europe. Poland's capital is Warsaw.

Geography

Poland borders Germany, the Czech Republic, Slovakia, Ukraine, Belarus, Lithuania, and Russia. The Baltic Sea lies to the north.

Most of Poland is low and flat. Hills and mountains rise in the south. The Tatra Mountains, on the border with Slovakia, are the highest range. Poland's main rivers are the Vistula and the Oder. Both flow northward into the Baltic Sea.

Poland has warm summers and cold, snowy winters. The mountains get the most rain and snow.

Plants and Animals

Forests cover about one quarter of the country. Larch, beech, oak, birch, pine, and spruce are common trees. The animals of the forests include deer, wild pigs, beavers, and elk. Bears, wildcats, and chamois (goatlike animals) roam the mountains. Small numbers of wisent, or European bison, live in the east.

People

Most of Poland's people are Poles. They speak Polish, a language related to Czech and Slovak. Small numbers of Ukrainians, Germans, and Belarusians also live in the country. The main religion is Roman Catholicism. More than half of the population lives in cities and towns.

Economy

Services such as banking, communications, and tourism are the fastest-growing parts of Poland's economy. Manufacturing is also important. Factories make food products, machinery, transportation equipment, iron and steel, and chemicals. The country also mines coal, sulfur, copper, and silver.

Agriculture is a small part of the economy, but many Poles still work as farmers. The main crops include pota-

Children wear traditional clothing at a ceremony in Poland.

toes, wheat, and sugar beets. Farmers produce pork, eggs, and dairy products as well.

History

People called Slavs came to what is now Poland more than 3,000 years ago. The written history of Poland begins in the AD 900s. At that time the Piast dynasty (ruling family) gained power in the region. The Piast ruler adopted Christianity in 966.

The Piast dynasty ruled Poland until the 1300s. In 1386 Poland's Queen Jadwiga married Wladyslaw II Jagiello, the grand duke of Lithuania. The marriage united Poland and Lithuania, which were known together as the Commonwealth. The marriage also started the Jagiellon dynasty. The Jagiellon rulers controlled Hungary and Bohemia (now part of the Czech Republic). They fought off powerful enemies.

Weakened Poland

After the Jagiellon dynasty ended in 1572, weak kings ruled the Common-

wealth. In the 1600s the Commonwealth fought costly wars with Sweden, Russia, and Turkey.

In 1772 Russia, Prussia (part of Germany), and Austria each took part of the Commonwealth's territory. The three powers divided the land again in 1793. After a third division in 1795, Poland no longer existed as a separate state.

The Poles formed a new Polish kingdom in 1815, but the Russians controlled it. The Poles revolted against Russian rule several times. Russia responded by stamping out Polish culture. For example, Russia ordered that Polish schools use the Russian language.

Rebirth of Poland

World War I (1914–18) led to the rebirth of Poland. The war weakened

TIMELINE

Poland adopts Christianity.		Russia, Austria, and Prussia take Poland's land; Poland ceases to exist.		Germany invades Poland.		Poland's Communist government falls.
966	1386	1772–95	1918	1939	1945	1989
	Poland and Lithuania unite.		Poland is reborn as an independent republic.		Poland becomes a Communist country.	

Russia, Austria, and Germany. Poland became an independent republic in 1918.

World War II

Germany and Russia (by then part of the Soviet Union) still wanted parts of Poland's land. In 1939 the two countries secretly agreed to divide Poland between them. In September 1939 Germany invaded western Poland. The invasion started World War II. Soon the Soviet Union took over the east.

In 1941 Germany turned against the Soviet Union and took over all of Poland. The Nazis of Germany killed about 3 million Polish Jews. This was part of a massacre called the Holocaust.

Communism

The Soviet Union drove the German army out of Poland in 1945. After the war Poland lost its eastern lands to the Soviet Union. However, it gained Ger-

man lands in the west. Meanwhile, the Soviet Union set up a Communist government in Poland. Secret police arrested and sometimes killed people who disagreed with the government.

In 1980 an electrician named Lech Walesa helped bring together almost 10 million Polish workers into an organization called Solidarity. It protested the Communist government. In 1981 the government made the group illegal.

Modern Poland

After more protests the government made Solidarity legal in 1989.

Communism soon collapsed. In 1990 Poland elected Walesa president. He and later leaders worked to improve the economy. Poland joined the European Union in 2004.

Did You Know?

On May 1, 1986, members of the Steger International North Pole Expedition reached the North Pole assisted only by dogs.

Polar Exploration

Polar exploration is the exploration of the lands around the North and South poles. The poles are the coldest and most remote regions on Earth. The North Pole is in the Arctic Ocean, which is covered by a huge, floating ice sheet. The South Pole is on land, in the frozen continent of Antarctica.

Some early polar explorers used dogsleds or went on foot. This was dangerous, as huge cracks in the ice could swallow dogs, sleds, and people. Other explorers used ships. This also was dangerous, as floating ice could wreck the ships. Later explorers used icebreakers (ships that can cut through ice), dirigibles (aircraft that float like balloons), airplanes, and snowmobiles.

Reasons for Polar Exploration

People made early polar explorations for a number of reasons. Some people wanted the fame that would come from being the first to reach an unknown land. Others were hoping to discover shorter sailing routes from Europe to eastern Asia. Still others sought to get rich from whale and seal hunting. More recently, people began exploring the polar regions to gather scientific information. Many adventurous explorers died or risked their lives trying to achieve these goals.

Exploring the Arctic

Native peoples have lived in the regions around the Arctic Ocean for thousands of years. The first outsider to reach the

Arctic was probably an ancient Greek named Pytheas. He reached Norway or Iceland in about 300 BC. The Vikings of Norway traveled to Iceland and Greenland in the 800s and 900s.

By the 1500s the Dutch and the English were venturing to the Arctic in search of trade routes. In 1878–79 a Swedish explorer, Baron Adolf Erik Norden-skiöld, sailed from Europe through the Arctic Ocean to the Pacific Ocean. This route was called the Northeast Passage. In 1905 the Norwegian explorer Roald Amundsen became the first to sail through the Northwest Passage. This was a route through the Arctic from the Atlantic Ocean to the Pacific Ocean.

The U.S. explorer Robert E. Peary claimed to be the first person to reach the North Pole, in 1909. Peary, Mat-

Matthew Henson (center) waves from the North Pole in 1909. With him stand other members of the group led by Robert E. Peary.

threw Henson, and four Eskimo (Inuit) made the last part of the trip on dogsleds. Some people later questioned whether Peary really did reach the pole.

In 1926 Amundsen and two companions flew over the North Pole in a dirigible. In 1937 pilots from the Soviet Union flew an airplane to the United States over the North Pole. In 1958 a U.S. submarine became the first ship to cross the North Pole under the Arctic ice sheet.

Exploring Antarctica

Several explorers first saw Antarctica in 1820. People first landed on the continent in 1895. British explorers Robert F. Scott and Ernest Henry Shackleton each led expeditions there in the early 1900s.

Scott reached the South Pole on January 18, 1912. He had hoped to be the first to do so. However, Roald Amundsen and four companions had reached the pole a month earlier, on December 14, 1911. Scott and his men died on their return trip.

In 1928 the U.S. explorer Richard E. Byrd set up a base on an ice shelf on Antarctica's coast. Byrd made the first flight over the South Pole in 1929.

Meanwhile, many countries were becoming interested in the scientific study of Antarctica. During 1957–58 scientists from several countries set up 50 bases throughout Antarctica for scientific research. In 1959 a number of countries signed the Antarctic Treaty.

Ross Island is in the Ross Sea, just off the coast of Antarctica. Several explorers have used the island as a base.

This agreement preserves the entire Antarctic continent for scientific research.

Police

The police are people whose job is to make sure that citizens follow the law and do not harm others. Police officers work for the governments of towns, cities, counties, states, and countries.

Police Today

The police have many tasks. First, they patrol, or keep watch over, streets and neighborhoods. Most police officers patrol in cars. But sometimes they patrol on foot, on horseback, on motorcycles, or on bicycles. Second, police go to the scenes of crimes and emergencies to catch criminals and to help victims. Third, police investigate, or study, crimes to find out who committed

A police officer at a crime scene brushes powder on a door in the hope of finding fingerprints. Police use fingerprints to identify criminals.

them. Police fight many types of crimes. One of the most serious is terrorism. (Terrorists use violence to try to affect people's beliefs or ways of life.)

Some police officers wear uniforms. Others work in everyday clothing, called plain clothes. Many police officers carry handcuffs, a notebook, and a two-way radio. Some also carry a handgun. Some use a stun gun or pepper spray to stop criminals without seriously harming them. Some officers travel with specially trained police dogs.

Police officers whose main job is investigating crimes are called detectives. Detectives usually work in plain clothes. They talk to witnesses, or people who may know something about the crimes. They also talk to suspects, or people they think may be guilty of the crimes.

Detectives sometimes use hidden microphones or cameras to record the conversations and actions of suspects.

At the scene of a crime, detectives look for evidence, or clues to help them figure out who committed the crime. Evidence includes fingerprints, footprints, bits of cloth, blood, hair, and anything else that the criminal may have left behind. When they find the person who they think committed the crime, they arrest that person. The person may then be put on trial to determine if they did commit the crime. During the trial, the detectives and other police officers often talk about the evidence they gathered when they were investigating the crime.

History

Ancient peoples, including the Sumerians, the Egyptians, and the Babylonians, had police forces. Their job was mostly to make sure that the people followed the rulers' orders. Emperor Augustus of Rome put together a large and well-organized police force in 7 BC.

Police officers block off a street in London, England, while they investigate terrorist attacks.

Over the centuries other cities and countries set up police forces.

By the 1800s police were using many modern tools and methods to do their jobs. Police first used telephones in Washington, D.C., in 1878. Finger-printing was introduced in the 1890s. Police first rode in cars in the United States in 1899. In the 1920s police started using ballistics—the study of bullets to match them to the gun that fired them. In the 1930s police began using small two-way radios to communicate with each other. Today police depend on computers to keep records and to search for information while solving crimes.

Polio

Polio, called poliomyelitis in full, is a disease caused by a tiny germ called a virus. In the past, polio attacked many children and left them paralyzed, or unable to move their muscles.

The first symptoms, or signs, of polio can be very mild. In fact, many people who get the disease feel fine. Others think they have caught a cold. In serious cases people complain of having pains in their neck, back, and legs. The pains are a sign that the polio virus has attacked the spine. The spine has nerves that control the muscles of the body. If the virus damages those nerves, the muscles become weak.

A child wears a brace on a leg that has been affected by polio.

Some people recover their muscle strength. Others become permanently paralyzed. If the virus damages the nerves controlling the leg muscles, the person can no longer walk. If the virus attacks the nerves controlling the lungs, the person cannot breathe without the help of a machine. There is no cure for polio.

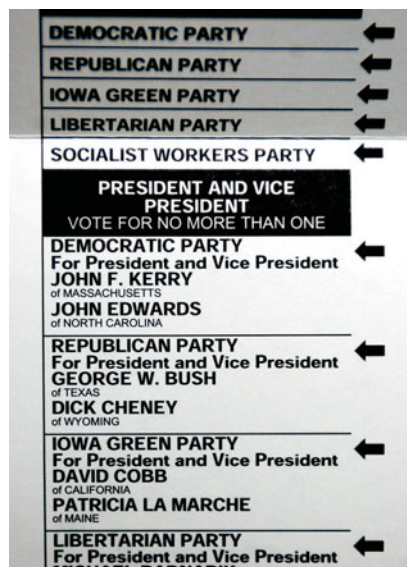

As recently as the 1950s polio affected thousands of people in the United States. Polio affected mostly children, but some adults got it as well. The U.S. president Franklin D. Roosevelt was paralyzed by polio as an adult.

In the early 1950s the medical researcher Jonas Salk made a substance called a vaccine to protect people from the virus that causes polio. Polio has disappeared from most countries because almost every child is vaccinated.

Political Party

A portion of a ballot from a U.S. presidential election shows candidates from large and small political parties.

Political parties are groups of people that work to be in charge of a government. The main way in which a political party gains power is through the election of its members to office. “Office” is a word for a government position—for example, the presidency or a seat in a legislature (lawmaking body). In many countries the party with the most members in the legislature has great control over the government.

Government leaders are the most powerful members of political parties. But ordinary voters may belong to political parties, too. Party members usually have similar beliefs about the role of government and how it should be run.

The number of political parties differs from country to country. Some countries have several parties, and all of them

may be represented in the government. Many European countries have three or more major political parties.

Other countries function with only two major parties. In the United States the two main political parties are the Democratic Party and the Republican Party. Other parties, called third parties, may exist in such a system. However, most people support either of the two main parties. It is almost impossible for third parties to gain power.

Still other countries have one-party systems. China, Cuba, and several African countries have such systems. There all members of the government must belong to the same party. People might form opposing parties, but their candidates may not run for office. Opposing parties may even be illegal. Such groups are sometimes called underground political parties.

Polk, James K.

James K. Polk was the 11th U.S. president. During his term the United States won a war with Mexico and gained much land along the Pacific coast and in the Southwest.

Early Life

James Knox Polk was born on November 2, 1795, in Mecklenburg County, North Carolina. He was the eldest child of Samuel and Jane Knox Polk. At age 11 he moved with his

Did You Know?

James K. Polk was the 11th president of the United States.

family to Tennessee. He graduated in 1818 from the University of North Carolina.

Polk then returned to Tennessee and studied law. In 1820 he started a law practice in Columbia, Tennessee. Four

years later he married Sarah Childress. They had no children.

Political Career

A Democrat, Polk was elected to the Tennessee legislature in 1823. A year later he was elected to the U.S. House of Representatives. He served there for 14 years, including four years as speaker (leader) of the House. In 1839 Polk was elected governor of Tennessee. He failed to win reelection in 1841 and again in 1843.

Presidency

The Democrats planned to choose Polk to run for vice president in 1844. A dispute over the presidential candidate, however, led the Democrats to ask Polk to run for president instead. In the election Polk defeated Henry Clay of the Whig Party.

As president, Polk settled a fight over the Oregon Territory. The United States and Great Britain both claimed the land.

TIMELINE

Polk is born in Mecklenburg County, North Carolina.

November 2, 1795

Polk becomes governor of Tennessee.

1839

Polk settles the Oregon dispute.

1846

Polk dies in Nashville, Tennessee.

June 15, 1849

Polk is elected to the U.S. House of Representatives.

Polk is elected president.

The Mexican War ends; the United States gains land.

Did You Know?

Polk was 49 years old when he became president. He was the youngest U.S. president up to that time.

Polk proposed dividing the territory at the line of 49° north latitude (the 49th parallel). After refusing, Britain finally accepted Polk's offer. In 1846 the United States received the part of Oregon south of the 49th parallel.

Polk also gained Texas and much of the Southwest for the United States. In 1845 the United States admitted Texas, formerly part of Mexico, as a state. That action caused the Mexican War of 1846–48. After the United States defeated Mexico, it bought more Mexican land. That territory included parts of what are now Arizona, California, Colorado, Nevada, New Mexico, and Utah.

Retirement

At the end of his term in 1849, Polk retired to his home in Nashville, Tennessee. He died soon afterward, on June 15, 1849.

Pollen

Pollen is the substance that causes plants to form seeds. New plants then can grow from the seeds. Both flowering plants and conifers (plants that grow seeds inside cones) make pollen. A grain of pollen is so tiny that it is best viewed through a microscope.

Pollination

The male parts of a plant, called stamens, make pollen grains. These grains

contain sperm cells. The female parts of a plant, called pistils, contain egg cells. During pollination, pollen grains travel from the male parts to the female parts. There, a sperm cell from the pollen joins with an egg cell. The fertilized cell then develops into a seed.

Some plants have only male or only female parts. They need help transporting pollen between plants. This is called cross-pollination. Other plants have both male and female parts. They can pollinate themselves. This is called self-pollination.

Pollen travels in many ways. Wind, water, and animals can carry it. Many plants have fragrant or colorful flowers to attract birds or insects (especially bees). These animals come to drink a sweet liquid called nectar. While an animal drinks the nectar, pollen from the flower sticks to its body. The animal

Self-pollination

A plant can pollinate itself if it has both stamens and pistils.

Cross-pollination

Most plants depend on a carrier, such as a bee, to bring pollen to them from another plant.

carries the pollen to other flowers when it moves on for more food.

Hay Fever

Some people have an allergic reaction when they breathe in pollen. They may sneeze, get a stuffy nose, or have itchy eyes. This condition is known as hay fever. People with hay fever suffer most during seasons when there is a lot of pollen in the air.

Pollution

Pollution happens when the environment is contaminated, or dirtied, by waste, chemicals, and other harmful substances. Pollution is a problem all over the world. But it is especially bad in large cities with a lot of industries and automobiles. There are three main forms of pollution: air, water, and land.

Air Pollution

Wildfires, volcanoes, and industrial chemicals cause some air pollution. But most air pollution comes from burning fossil fuels. These include coal, oil, and natural gas. Factories, electrical plants, and automobiles burn these fuels for power. The burning of fossil fuels may release solid particles, such as ash and soot, into the air. It also may release harmful gases. This type of pollution may be seen in the form of smog over

The smokestacks of chemical plants send pollution into the air.

Workers clean a seacoast that is coated with oil spilled by a tanker ship.

big cities. The word smog is a combination of “smoke” and “fog.” Smog-filled air is hazy, or hard to see through.

Air pollution may cause such diseases as cancer and asthma. Air pollution also leads to acid rain, or polluted rain that can harm living things. In addition, air pollution may be a cause of global warming, which is a steady rise in Earth’s average temperature. Finally, air pollution damages a part of the atmosphere called the ozone layer. The ozone layer is important because it protects Earth against harmful rays from the sun.

Water Pollution

Some causes of water pollution are easy to see. People dump garbage and sewage into creeks, rivers, ponds, lakes, and oceans. Factories or cities sometimes release oils, poisonous chemicals, and other wastes into water.

Other causes of water pollution are not so direct. The use of chemicals in farming is one example. Farmers use some

chemicals as fertilizers, or substances added to soil to help crops grow. They use other chemicals as pesticides or herbicides. These are substances that kill pests or weeds. When these chemicals seep into the ground, they may make the groundwater unfit to drink. Chemicals also may drain into rivers and lakes, where they can harm fish and other forms of life.

Land Pollution

Littering, or tossing garbage on the ground, is a form of land pollution. Litter is unpleasant to look at. It also can destroy the habitats, or homes, of plants and animals.

The buildup of dangerous chemicals in the ground is another form of land pollution. The chemicals may come from farms or factories. These chemicals can spread to plants and animals. They may even harm people who eat the contaminated plants and animals.

Controlling Pollution

Many governments, environmental groups, and ordinary people are working to control pollution. Governments have passed laws to keep people from releasing dangerous chemicals into the environment. Some companies and people are trying to use fewer fossil fuels.

Instead they are getting power from the sun, wind, water, and other energy sources that produce less pollution.

Many communities use recycling to reduce pollution. Recycling is the process of making new products out of used

paper, plastic, glass, aluminum, or other materials.

Polo, Marco

During the Middle Ages the Italian merchant Marco Polo spent many years in China. He wrote a famous book about his experiences. The book helped Europeans to learn about Asian peoples and goods.

Marco Polo was born in about 1254, probably in Venice (now in Italy). His father and uncle were merchants who traveled to many lands. In 1271 they took young Marco to Asia. The Polos sailed over the Mediterranean Sea to what is now Israel. Then they traveled overland through Turkey, Persia (now Iran), and Afghanistan. In central Asia

they followed a trail called the Silk Road. The Silk Road was a trade route for fine silk cloth from China.

In 1275 the Polos reached Shangdu, in Mongolia. This was the summer home of Kublai Khan, the Mongol emperor of China. For about 17 years Marco Polo worked for the emperor. His errands took him all the way to southwestern China and probably to Burma (now Myanmar).

For their return trip to Venice, the Polos took 14 of Kublai Khan's ships. They sailed from eastern China to the coast of Persia. Then they went overland through Persia and Turkey. They finally reached Venice in 1295. Everyone was amazed to see them alive after so many years.

Marco Polo soon went back to sea. Forces from the trading city of Genoa, a rival of Venice, captured his ship. They put Polo in prison. There he met a

Pomo

An old photograph shows a Pomo woman gathering seeds into a basket.

The Pomo are Native Americans of northern California. There are about 72 separate tribes grouped together as Pomo.

Pomo along the coast of the Pacific Ocean traditionally lived in cone-shaped homes made from the wood and bark of redwood trees. The Pomo farther inland lived in larger rectangular houses built from poles, brush, and grass. The Pomo fished and hunted deer, birds, and small animals. They also gathered and ate many types of wild plants.

Spanish explorers may have visited the Pomo in 1542. In 1811 or 1812 Russian fur traders founded Fort Ross in Pomo territory. The Russians forced the Pomo to hunt sea animals and give them the animals' furs.

A few years later Spanish priests built a mission in the area. They got some Pomo to live and work at the mission. The Spanish often treated the Pomo harshly. In addition, many Pomo died from smallpox and other diseases brought by the Spanish.

Gold was discovered in California in 1848. Thousands of U.S. settlers rushed to the area, taking Pomo lands. The settlers killed many Pomo. They forced other Pomo to work in mines as slaves. At the end of the 20th century there were about 5,000 Pomo living in the United States.

Pompeii

Pompeii was an ancient city in southern Italy. In AD 79 a volcano called Mount Vesuvius erupted close by. Thousands of people died, and the city was buried. Archaeologists later cleared away much of the rubble. They uncovered ruins that gave historians a look at life in the Roman Empire.

The Ancient City

People lived in the Pompeii region in prehistoric times. The Romans took control of Pompeii in about 290 BC.

Many of the buildings that were excavated in Pompeii are now open to the public. On display in one room is a plaster cast of one of the people who died in the city. The people who excavated Pompeii discovered that the ashes that covered the city made molds of some of the people who died there. Scientists later made models from those molds.

They brought Roman architecture and culture to the city.

Mount Vesuvius began to erupt on August 24, AD 79. The eruption lasted for several days. Poison gases from Vesuvius choked many people. Then volcanic stones and ashes covered the city. When the eruption ended, Pompeii was buried to a depth of 19 to 23 feet (6 to 7 meters).

The Archaeological Site

The debris protected Pompeii from vandals and the weather for hundreds of years. An Italian architect discovered the ruins in the late 1500s. Archaeologists began excavating, or digging out, the city in 1748. The work at Pompeii and Herculaneum, another city buried by Vesuvius, marked the start of modern archaeology.

The early excavations were not well organized. Many early diggers were interested only in finding treasure. After 1860, however, archaeologists made sure that the work was done in an orderly way. By the 1990s about two thirds of the city had been excavated.

Historians have learned a lot about the Roman world from the excavations. They can walk down streets and look at temples, public baths, houses, and shops. The digging uncovered charred nuts and fruits in market stalls and loaves of bread in bakeries. Historians have also learned about life in Pompeii from statues and pictures.

Did You Know?

The ancient city of Stabiae was also destroyed by the eruption of Mount Vesuvius.

Ponca

The Ponca are Native Americans of Oklahoma and Nebraska. They once lived along the coast of the Atlantic Ocean, but they later moved west.

The Ponca lived in earth-covered lodges. They fished, hunted, and gathered wild plants for food. In spring and autumn they lived in portable tepees while hunting bison (buffalo).

By the late 1600s the Ponca were living in what is now Minnesota. Warfare with the Sioux people forced the Ponca to move even farther west. They settled in southwestern Minnesota and the Black Hills of South Dakota.

Standing Bear was a Ponca chief. In 1879 he went to court to challenge the U.S. government's treatment of his people. The court ruled in his favor. The case was very important to the cause of Native American rights.

By the early 1800s diseases brought by white settlers had reduced the tribe from about 800 people to about 200. In 1877 the U.S. government forced the Ponca to move to Indian Territory (now Oklahoma). Some Ponca left Indian Territory and traveled north on foot for 600 miles (965 kilometers) to eastern Nebraska. The Ponca who settled in Nebraska became known as the Northern Ponca. The Ponca who stayed in Indian Territory became known as the Southern Ponca. By the late 20th century the number of Ponca had grown to more than 3,000.

Ponce de León, Juan

Juan Ponce de León was an early Spanish explorer of the Americas. He was the first European to visit Florida. He is also famous for his search for the legendary Fountain of Youth.

Ponce de León was born in 1460 in the Spanish province of León. He may have sailed to the Americas with Christopher Columbus in 1493. In 1502 he helped to conquer the island of Hispaniola, in the Caribbean Sea. In 1508 he founded Puerto Rico's earliest European settlement. In 1509 he became governor of the island.

While in Puerto Rico, Ponce de León heard about an island where a spring flowed with water that kept people young. In March 1513 he went looking

Juan Ponce de León

for the island. He landed on the mainland of North America, though he thought he was on an island. He named the territory Florida.

Ponce de León had landed near what is now Saint Augustine, in the northeastern part of the state. He did not find the fountain so from there he traveled south along the coast. He continued through the chain of islands called the Florida Keys to Florida's west coast. On the way he discovered the Gulf Stream, a warm ocean current that flows northward.

Ponce de León returned to Spain in 1514. The king gave him permission to start colonies in the areas he had visited. In 1521 Ponce de León sailed again to Florida. He was wounded in an attack by Native Americans. His crew took him to Havana, Cuba, where he died.

Pontiac

Pontiac was a Native American chief of the Ottawa people. He is best known for leading a war to stop the British from taking control of the Great Lakes area. The war is now called Pontiac's War.

Pontiac was born in about 1720 in what is now Ohio. Little is known of his early life. By 1755 he had become a chief.

At first Pontiac was friendly to British settlers. But he soon realized that they were trying to take control of his peo-

Pontiac

ple's land. In 1762 he asked other Native American tribes in the region to help stop the British. He planned surprise attacks on British forts. In 1763 Pontiac himself tried to capture a fort on the site of Detroit, Michigan. He was defeated after five months of fighting.

In all, Pontiac's forces attacked 12 forts and captured 8 of them. They also destroyed many British settlements. After a few years of war Pontiac grew tired. He agreed to a peace treaty with the British in 1766. On April 20, 1769, Pontiac was killed by a Peoria Indian in what is now Cahokia, Illinois.

Pony Express

The Pony Express was a service that delivered mail on horseback between Missouri and California. The service

lasted for only about a year and a half in the early 1860s. Nevertheless, the Pony Express is well remembered in the stories of the American West.

Starting in the 1840s many people moved to the western United States. Mail from the East took a long time to reach the Westerners. It took about a month for a letter to travel from New York to California by sea. A stagecoach service from Saint Louis, Missouri, to San Francisco, California, took 24 days.

A company called Russell, Majors, and Waddell decided to set up a horseback mail service from Saint Joseph, Missouri, to Sacramento, California. The route was about 1,800 miles (2,900 kilometers) long. Along the way there were

157 stations—one about every 10 to 15 miles (16 to 24 kilometers).

A rider carried about 15 pounds (7 kilograms) of letters in a pouch. He changed horses at every station. After 6 to 8 stations a new rider took over. Only the pouch of mail traveled the entire distance. This usually took about 10 days.

The first mail pouch left Saint Joseph on April 3, 1860, and arrived in Sacramento on April 13. The service was closed down after a telegraph system was completed in October 1861. The Pony Express lost only one load of mail, even though the riders faced outlaws, unfriendly Native Americans, and rough country. The most famous Pony Express

The Pony Express crossed the Rocky Mountains and the Sierra Nevada on the route between Missouri and California.

rider was William Cody, who later became known as Buffalo Bill.

Pope

The pope is the head of the Roman Catholic church. The office or institution associated with the pope is called the papacy. The pope rules the church much as a king rules a country.

Duties

The pope does many things. He has an organization called the Roman Curia to help him. The pope decides the church's position on issues. He makes church laws. He has the power to call ecumenical councils, which are general meetings that decide church policy. The pope also appoints clergymen called bishops and assigns them to regions called dioceses. A bishop is in charge of all the Catholic churches within his diocese.

The pope himself is the bishop of Rome, Italy. He rules Vatican City, which lies within Rome's borders but is a separate country. Vatican City is all that remains of the Papal States, a region of Italy that the popes ruled from 756 to 1870.

Elections

The pope is elected to his position. Only the highest-ranking bishops, who are called cardinals, have votes. After a pope dies, all the cardinals under age 80 gather in a building called the Sistine

The pope blesses a gathering of people in Vatican City.

Chapel. There they secretly vote for a new pope. White smoke from the chapel chimney is the signal that a new pope has been elected.

History

Catholics consider Saint Peter, who died in about AD 64, to be the first pope. Peter was one of the 12 disciples, or first followers, of Jesus Christ. Since then there have been more than 260 popes.

During the Middle Ages, which lasted from about AD 500 to about 1500, unhappy cardinals sometimes chose their own popes. These unofficial popes are now known as antipopes. Beginning in 1378, during a period called the Great Western Schism, there were popes in Avignon, France, and in Rome. By 1417, however, the cardinals had agreed on one pope. Since then, every pope has lived in Rome.

Poplar

Some kinds of poplar grow tall and narrow.

Poplars are fast-growing trees. People like them for their beauty and the shade they provide. Aspens and cottonwoods are types of poplar. Poplars are closely related to willows.

Poplars grow in many parts of North America, Europe, Asia, and North Africa. Many grow in moist, wooded areas or near water. Poplars come in many shapes and sizes. At up to 200 feet (60 meters), the Western balsam poplar is one of North America's tallest trees. Other types grow only to about 100 feet (30 meters).

Flowers appear on all poplars. The flowers develop pods filled with tiny seeds. These pods will open and the fluffy seeds will float to the ground. Poplar leaves are oval, heart-shaped, or round. The top of the leaf is light or dark green. The underside is fuzzy and either a lighter green or silvery color. Poplar leaves flutter in the gentlest breeze.

Poplars have soft wood that is used to make furniture, particle board, and

paper. Although it is useful in some ways, the poplar tree can also cause problems. The roots are always looking for water. If poplars are planted too close to water pipes or sewer lines, their roots will clog them. In addition, poplars have more insect damage, disease, and rotting than many other trees.

Poppy

Poppies are flowers that are valued for their brilliantly colored blossoms with papery petals. They are grown as garden plants and also for their seeds.

Poppies grow in mild climates throughout the world. Most species, or types, of poppy grow best in sunny areas with moist soil. Some, however, can grow in rocky deserts.

California poppies grow wild in a meadow.

Poppies come in different sizes. Some are tiny plants that grow near the soil. Others grow to more than 15 feet (4.6 meters) in height. The leaves may be green or bluish green. Some leaves, stems, and the pods that hold the seeds are hairy.

Poppy flowers are shaped like cups and have four to six petals. They may be red, orange, yellow, pink, blue, lilac, or white. Some species have a dark blotch at the center of the flower. Poppies do not give off a strong smell.

Most types of poppies have only one flower on each stem. The flowers close at night and open in the morning. When the soil is dry, the seed pod opens and many small seeds fall to the ground.

One type of poppy produces seeds that have a nutty taste when dried. The seeds are used for baking breads and desserts. In addition, medicine to relieve pain can be made from the same poppy.

Popular Music

Popular music is any type of music that a large number of people enjoy. Popular music, also called pop, is usually top-selling music created by professional musicians.

Popular music is different from folk music. Folk music is the traditional music and songs of common people. Popular music is also different from classical music, which is often more formal or artistic.

A popular music act draws a large crowd at an outdoor concert in Australia.

Types of Popular Music

There are many types of popular music. Some of the best-known types are rock, country, rap, rhythm and blues (or R&B), dance music, the blues, jazz, and reggae. People throughout the world listen to these forms of popular music.

Other popular music is known mainly in a certain country or region. Often this kind of popular music is based on the traditional music of the area. If this type of music gains popularity around the world, people call it world music.

It is very common for popular music to be popular for only a short time. New songs regularly replace hit songs. Even types of popular music lose popularity. The styles of ragtime, vaudeville, big band, soul, funk, and disco are no longer as popular as they once were. However, some songs and styles have remained popular for many years.

History

Popular music developed out of many styles of religious, folk, and classical

Did You Know?

The first important U.S. popular song-writer was Stephen Foster (1826–64). He wrote “Oh! Susanna,” “Swanee River,” and many other songs that people still know.

music. In the 1800s concert bands and traveling musical groups brought popular music to more and more people.

In the late 1800s and early 1900s the United States became an important center of popular music. Songwriters in New York City wrote many popular songs. African Americans created jazz and other new forms of popular music.

In the early 1900s phonograph records appeared, so people could listen to music in their homes. Soon the first radio stations began broadcasting orchestras playing popular songs.

Rock and roll, a mixture of country and blues music, appeared in the 1950s. Rock and roll became wildly popular with young people. Rock is still the best-known form of popular music.

In the late 20th and early 21st centuries radio, television, movies, and the Internet helped popular music to grow and to change. These inventions made it possible for millions of people to hear a single song at the same time. They also helped to make popular music into the huge business that it is today.

Porcupine

Porcupines are rodents with sharp spines called quills. The quills are stiff hairs about 3 inches (7.5 centimeters) long that act as armor to protect the porcu-

pine. Many people believe that porcupines can shoot their quills, but this is not true.

Porcupines live in Europe, Africa, Asia, and throughout the Americas. Some porcupines live on the ground and others live in trees. They sleep in caves, in holes in trees or on the ground, or in hollow logs.

Porcupines are stout, short-legged animals. They often move slowly. Their color ranges from grayish brown through dark brown to blackish. The quills are generally white with black tips or bands of yellow, orange, or black. Some porcupines have more than 30,000 quills.

When threatened, a porcupine may grunt and stamp its back feet in warning. It also sticks up its quills and rattles them. The quills come off easily and can stick in the enemy’s skin. The quills can seriously hurt or even kill other animals.

Porcupines are basically plant eaters. Some like to eat the layer beneath bark

Porpoise

Porpoises are the smallest members of the large group of animals called whales. People often confuse porpoises with their close relatives, the dolphins. Porpoises and dolphins have a similar appearance, but a porpoise is usually smaller and chubbier than a dolphin. It also has a shorter and more rounded snout.

There are six species, or types, of porpoise. Most live in the oceans and seas north of the equator. The harbor porpoise is one of the most common species. It lives in the northern parts of the Atlantic and Pacific oceans. South of the equator, porpoises live along the coast of South America and in the area of the East Indies.

Porpoises grow to no more than 7 feet (2 meters) long. The skin is smooth, usually with a color pattern combining black, white, and gray. Porpoises have two flippers on their sides, and most have a triangle-shaped fin on the back.

Porpoises are mammals and not fish. Porpoises have lungs and need to come to the water's surface to get air. They breathe through a single nostril, called a blowhole, on the top of the head.

Porpoises generally swim together in small groups of two to four. About 10 to

The harbor porpoise got its name because it is often seen in bays and harbors.

12 months after mating, a female porpoise gives birth to a single offspring called a calf. The harbor porpoise usually lives for about 6 to 10 years, but other types live longer.

Benin

Portugal

Portugal has a long seacoast and many beaches.

Portugal is a small country on the western edge of Europe. About 500 years ago Portuguese sailors were some of the first Europeans to explore the world. Portugal's capital is Lisbon.

Geography

Portugal sits on the Iberian Peninsula, a piece of land in southwestern Europe. It shares the peninsula with Spain, which lies to the north and east. The Atlantic Ocean lies to the west and south. The Azores and the Madeira islands are also part of Portugal. They lie far off the mainland, in the Atlantic Ocean.

Northwestern Portugal is hilly and rainy. The northeast is mountainous and drier. It contains the mainland's highest mountain range, the Estrela Mountains. Southern Portugal has low plains and gentle hills. In general, Portugal's win-

ters are mild and humid, and the summers are warm and dry.

Plants and Animals

Forests of oak, beech, chestnut, and pine trees grow in the north. The south has shrubs, grasses, and small groups of cork oak and other trees. Animals include foxes, rabbits, hares, goats, and deer. Wolves live in the Estrela Mountains.

People

Most of Portugal's people are Portuguese. There are small groups of Africans, Brazilians, and other Europeans. Portuguese is the national language. The main religion is Roman Catholicism. Most people live in cities and towns, mainly in the north.

Economy

Services and manufacturing are important parts of Portugal's economy. Ser-

© 2006 Encyclopædia Britannica, Inc.

Portuguese folk dancers perform a traditional dance.

vices include tourism, banking, and health care. Manufacturers make clothing, shoes, machinery, vehicles, cork and wood products, and other goods. Portugal sells many of those goods to other countries.

Farming is a small part of the economy. However, Portugal is famous for its port and Madeira wines, which are made from local grapes. Other crops include potatoes, tomatoes, olives, and grains.

History

Iberian peoples settled in what is now Portugal more than 7,000 years ago. Celtic peoples began to arrive about 3,000 years ago. Ancient Rome ruled the Iberian Peninsula from the 100s BC to the AD 400s. Germanic peoples controlled much of the land until Muslims invaded in 711.

The Muslim invasion left only northern Portugal in Christian hands. In 1179 the kingdom of Portugal was established there. It expanded as it reconquered the

Muslim-held lands. The reconquest was done by about 1250.

Age of Discovery

The kingdom of Portugal soon became one of Europe's great powers. At the same time the Portuguese forced many Jews to become Christians or to leave Portugal.

In the 1400s Portuguese explorers began sailing to Africa, India, Indonesia, China, the Middle East, and South America. Bartolomeu Dias and Vasco da Gama discovered new routes from western Europe to Asia. In 1500 Pedro Álvares Cabral claimed Brazil for Portugal. By the 1500s Portugal had a huge overseas empire.

Foreign Control

Spain took over Portugal in 1580. A Portuguese revolution forced out the Spanish in 1640. France attacked Portugal in the early 1800s. The Portuguese royal family escaped to Brazil. In 1821, after France was defeated, the Portuguese king returned to Portugal.

Modern Portugal

Portugal overthrew its monarchy in 1910. The military seized power in 1926. A dictator (a leader with absolute power) ruled the country for many years after that. Portugal finally held free elections in 1976. Today Portugal is a member of the European Union.

Poseidon

Poseidon was the god of the sea in ancient Greek mythology. According to legend, he was one of the 12 chief gods who lived on Mount Olympus.

Poseidon also was said to have a palace under the sea. Poseidon's main symbols were the dolphin and the trident (a three-pronged spear). The name Poseidon means "husband of Earth" or "lord of Earth." The ancient Romans called Poseidon by the name of Neptune.

According to legend, Poseidon was the son of Cronus and Rhea, who were Titans. The Titans were a race of giants who once ruled the world. Poseidon had two brothers, Zeus and Hades. Together they defeated the Titans and took power. Zeus became the supreme ruler on Earth, and Hades became the lord of the underworld. Poseidon became the ruler of the oceans.

The ancient Greeks believed that Poseidon could use his trident either to stir up storms at sea or to calm the waves. He also used his trident to shatter rocks. Because of this, he became known as the god of earthquakes.

The Greeks also honored Poseidon for creating the horse and giving it to humans. He was the father of the winged horse called Pegasus. Poseidon's own horses had golden manes and pulled his chariot over the sea. In ancient works of art Poseidon is some-

Postal Service

A postal service is a system used to send mail (letters and packages) from one place to another. Today people can send mail nearly anywhere in the world.

How Postal Services Work

People pay for using postal services in several ways. Senders may pay by putting a stamp on the mail. They may also take their mail to the post office and pay a clerk or a postage machine. Heavier mail costs more to send. People mail their letters and packages by placing them in a mailbox or taking them directly to the post office.

At the post office, postal workers sort the mail by size. Letters go through a machine that cancels the stamps. This means that the machine prints lines over the stamps so that they cannot be used again. The machine also prints the date, the time, and the place of stamping. This is called the postmark.

Postal workers then sort the mail according to its destination (the place where it

Many letter carriers deliver mail on foot.

is going). They may sort it by hand or with the help of machines.

Postal workers send the mail to its destination by truck, train, ship, or airplane. Postal services around the world cooperate so that mail can even travel between countries. At the destination, letter carriers deliver the mail to each address. Many letter carriers travel on foot or in small mail trucks.

History

Postal services have been an important method of communication for thousands of years. Egypt had a postal service in about 2000 BC. The Chinese used riders on horseback to deliver mail by about 1000 BC. For hundreds of years governments sent almost all mail.

Then, in the AD 1200s, trade between faraway countries began to increase. To communicate about trade, groups of

Modern postal services have machines to sort the mail.

business owners and bankers set up their own private postal services. Towns, workers' groups, religious groups, and universities also set up ways to send and receive messages.

In the 1500s and 1600s most private postal services went out of business. National governments took over most postal services. One famous private service that emerged later was the Pony Express. It delivered mail on horseback in the western United States in the early 1860s.

National governments still run most postal services. Since the early 1970s private companies have also offered some services, especially the delivery of packages. In the 1990s many people began to send faxes and e-mail instead of written letters. However, people today still use postal services, especially when they want to send important or private information.

Potato

The potato is one of the main food crops of the world. It grows well in cool climates. Potatoes are often boiled, fried, or baked. They are served whole or mashed, cut up into fries, or made into potato chips.

The potato belongs to the nightshade family of plants, which also includes eggplant, tomatoes, and garden peppers. The scientific name of the potato is

Potatoes are thick, underground stems of a potato plant.

Solanum tuberosum. It is not related to the sweet potato.

The potato plant can grow to 20 to 40 inches (50 to 100 centimeters) high. It bears white or purplish flowers. The leaves are about 8 to 12 inches (20 to 30 centimeters) long and divided into parts called leaflets.

The stems of the potato plant grow underground. The ends of the stems thicken to form potatoes. The potatoes have buds, or “eyes,” that can grow into new potato plants. The skin of a potato varies in color from brownish white to deep purple. The inside is usually white or yellow, but it can be purple.

Indians of South America might have grown potatoes as early as 1,800 years ago. Spanish explorers of the Americas brought potatoes back to Europe in the 1500s. By the end of the 1600s potatoes were the major food crop in Ireland. In the 1840s disease ruined the potato crop

in Ireland. A famine resulted. More than a million people died from starvation or diseases related to the famine.

Potawatomi

A Potawatomi dancer wears traditional clothing.

The Potawatomi are a Native American people who traditionally lived near the Great Lakes. Their lands included parts of what are now the states of Michigan, Wisconsin, Illinois, and Indiana. They were closely related to their neighbors, the Ottawa and the Ojibwa.

The Potawatomi built large, bark-covered houses. They also built smaller, dome-shaped homes called wigwams. They grew corn and squash and gathered berries, seeds, and wild rice. They fished and hunted deer, bison (buffalo), elk, and small animals.

French explorers entered Potawatomi lands in 1634. The tribe gave the French furs in exchange for metal tools, beads, cloth, and guns.

In the 1830s the U.S. government forced the Potawatomi to give up much of their land. Some of the tribe fled to Canada. Most Potawatomi moved to a reservation in what is now Kansas. The Kansas Potawatomi became known as the Prairie Band. In the late 1860s some of the Kansas Potawatomi moved to Indian Territory (now Oklahoma). They became known as the Citizen Band.

At the end of the 20th century there were about 16,000 Potawatomi in the United States. Most lived in Kansas, Oklahoma, Michigan, Wisconsin, and Indiana. A small group lived in Canada.

Pottery

Pottery is the art of making objects of clay. The clay is shaped and then fired (baked at a high temperature) to harden it. The items created in this way also are called pottery. Like brick and tile, pottery is a type of ceramic, a material made from nonmetallic minerals.

Ancient peoples all around the world made pottery. Pottery was a useful invention because it could carry water or store food. Yet it also became a form of art and a way to tell stories through its paintings. Archaeologists study ancient pottery because it provides clues as to

Ancient Greeks of the Minoan civilization made decorated pots in about 1700 BC.

how people lived, what they believed in, how they fought, and what they ate.

Today factories mass-produce many kinds of pottery. But potters around the world still handcraft fine pieces that are more like works of art.

Types of Pottery

There are three basic types of pottery—earthenware, stoneware, and porcelain. Earthenware is the simplest and oldest form of pottery. Water can soak through earthenware even after it is fired. But when earthenware is coated with a substance called a glaze, liquid cannot soak through. The glaze is melted under high heat to form a glassy surface.

Liquid cannot soak through stoneware and porcelain even when they are left unglazed. If a glaze is applied, it is only for decoration. Stoneware is very hard. Porcelain is smooth, light, and thin, and usually light can shine through it. Both stoneware and porcelain originated in

China more than 1,000 years ago. China has been a leading center of pottery since ancient times. Many people still call porcelain “china.”

How Pottery Is Made

One of the simplest ways to make pottery is with long ropes of clay. The potter coils these ropes on top of each other to make a bowl or vase shape. Then the potter smooths the surface.

In another method, called slip casting, the potter pours liquid clay into a mold. The clay then hardens into the desired shape. Slip casting is useful for making pottery in flat or unusual shapes.

Pottery is often made on a potter’s wheel—a round, flat surface that spins around. The potter puts a chunk of clay on the wheel and then shapes the spinning clay into a pot or other rounded object. Because the wheel spins, it is easy for the potter to keep the sides even.

Chinese porcelain vases from the late 1600s or early 1700s are decorated with scenes of daily life.

A man in India makes pottery on a wheel he spins with his foot.

When the pottery is dry, it is ready to be fired. The potter places it in a kiln, or high-temperature oven. Earthenware may need a temperature of 1,400° F (760° C), while stoneware or porcelain may need 2,700° F (1,480° C).

After firing, the hardened pottery can be glazed and painted. Glazes are made of ground minerals that produce different colors. Paint may be applied either under or over the glaze. After glazing and painting, the pottery is often fired again so that the glaze hardens and becomes shiny.

Poultry

Poultry are birds that people raise for meat, eggs, and feathers. Domesticated (tame) chickens, turkeys, geese, and ducks are poultry. People learned how to raise poultry thousands of years ago.

Raising poultry at home meant that a family always had eggs and meat to eat.

Today raising poultry is one of the largest agricultural, or farming, businesses in the world. Poultry are usually raised inside large, modern buildings. A building may have as many as 70,000 birds. But some farmers allow their birds to roam free during the day. These birds usually roost, or sleep, inside. They also come inside to lay their eggs. Farmers feed their birds special diets. They control the diseases and keep away the predators that may harm the birds.

Poultry come in many different colors and sizes. Kinds of poultry are grouped together by breed. A breed is a group of birds that share certain traits—for example, feather color, egg color, and their type of comb. (A comb is the fleshy growth on the head of a chicken.)

Powell, Colin

Colin Powell

Colin Powell was an important military and political figure in the United States in the late 20th and early 21st centuries. He was a general in the Army. He also served as secretary of state to President George W. Bush.

Colin Luther Powell was born on April 5, 1937, in New York City. His parents were immigrants from Jamaica. Powell studied geology at the City College of New York. He graduated in 1958 and became a U.S. Army officer.

Powell earned medals while serving in the Vietnam War in the 1960s. He then rose in the ranks of the Army. He was often assigned to help high officials in Washington, D.C.

In 1989 Powell became the country's top military officer, with the title of chairman of the Joint Chiefs of Staff.

Powell became well known as a commander in the Persian Gulf War of 1991.

Powell retired from the Army in 1993. Many people wanted him to run for president in 1996, but he chose not to run. In 2001 President Bush appointed Powell as secretary of state. Powell became the first African American to hold that position.

Powell's biggest challenge as secretary of state was to get other countries to support a U.S.-led invasion of Iraq, which began in March 2003. Powell retired as secretary of state in January 2005.

Prague

Population
(2007 estimate)
1,188,126

Prague is the capital of the Czech Republic, a country in central Europe. The city lies on the Vltava River. It is the largest city in the Czech Republic.

Prague is a beautiful city known for its buildings and cultural life. The city has many historic churches and palaces. Its most famous landmark is the ancient

Arched bridges span the Vltava River in Prague, Czech Republic.

castle of Hradcany. The Charles Bridge is a stone bridge built in the 1300s.

Each spring Prague hosts an international festival of classical music. The city has two world-class orchestras and many theaters.

Economy

Industries in Prague are very important to the economy of the Czech Republic. Most people in the city work in industries that provide services, such as tourism, banking, and trade. Manufacturing also brings money to Prague. Factories in the city make machinery, chemicals, food products, and electronics.

History

Prague dates back to at least the 800s. The rulers of the country called Bohemia made it their capital in the 900s. The city became one of Europe's major centers of trade and culture.

In 1918 an independent country called Czechoslovakia was created in central Europe. Prague was its capital.

German troops controlled Prague from 1939 to 1945, during World War II. A few years later Czechoslovakia became a Communist country. The Soviet Union invaded Prague in 1968 to make sure that the country stayed Communist. In 1989 Prague's citizens held large protests against Communism. Soon afterward Communism ended in Czechoslovakia.

In 1993 Czechoslovakia broke into two separate countries, the Czech Republic and Slovakia. Prague became the capital of the Czech Republic.

Praia

Population
(2005 estimate)
111,500

Praia is the capital of Cape Verde, an island country off the northwest coast of Africa. It is the largest city in Cape Verde. It lies on São Tiago, the country's largest island.

Praia has a port on the Atlantic Ocean. Ships load up there with foods, shoes, clothing, and other products for sale overseas. Factories in the city process fish.

No one lived on the islands of Cape Verde in ancient times. The Portuguese began settling the islands in the 1460s. They first settled the town of Ribeira Grande, which became the first capital. They later moved the capital to Praia. This was partly because Praia's harbor was safer for ships involved in the slave trade. The slave trade became a major part of the city's economy. Slavery ended on the islands in 1876.

Cape Verde became an independent country in 1975. Praia remained its capital.

Prairie Dog

Prairie dogs are rodents that bark like dogs. They belong to the squirrel family. Prairie dogs are known for their large underground colonies. Sometimes called

A black-tailed prairie dog can look out over prairie grass when it stands upright.

towns, these colonies have many rooms and tunnels.

There are five species, or types, of prairie dog. The best known are the black-tailed prairie dog and the white-tailed prairie dog. Prairie dogs live on prairies in western North America.

Prairie dogs have plump bodies and short legs. Their claws are long and powerful. Not including their tails, prairie dogs are about 11 to 13 inches (28 to 33 centimeters) long. They can weigh almost 4 pounds (2 kilograms). Most prairie dogs have yellowish brown fur.

Prairie dogs are active in the daytime. During winter, three of the species hibernate. This means that they stay inactive until spring.

A female prairie dog gives birth to a litter of up to 10 young. After about two years the male young are driven away. They move to new colonies. Females usually stay.

Prairie dogs eat grass. Sometimes they leave little grass for cattle. For this reason some people consider prairie dogs a pest.

Other people think prairie dogs are very important. They say that many animals depend on the prairie dog. Foxes, coyotes, badgers, and hawks eat prairie dogs. Rabbits and snakes live in holes dug by prairie dogs.

Prehistoric Life

Long before people appeared on Earth, other forms of life existed. Many of these living things are now extinct, meaning they have died out completely. The period when they lived is called prehistory, or prehistoric times.

Everything that people today know about prehistoric plants and animals comes from fossils. Fossils are the remains or traces of early life-forms. They are often found in rocks.

Precambrian Life

The earliest life-forms developed during the earliest period of Earth's history, called Precambrian time. Precambrian

time began with the formation of Earth's crust, about 4 billion years ago. It ended about 543 million years ago. Scientists do not know exactly when life-forms first appeared, but the oldest known fossils are more than 3 billion years old.

The first life-forms had only one cell. They included early types of bacteria, algae, and protozoans. Living things with more than one cell began to appear late in the Precambrian. All life at this time lived in Earth's oceans.

Paleozoic Life

The next period of Earth's history is called the Paleozoic era. It lasted from about 543 million years ago to about 248 million years ago. At first, all living things were in the oceans. By the end of the era, plants and animals also lived on land.

Over hundreds of millions of years, life spread through the seas and over Earth's surface.

Ocean Life

Early Paleozoic animals were similar to the jellyfish, sponges, and worms that live in oceans today. Other animals in the oceans were arthropods—the early ancestors of crabs, insects, and spiders. Arthropods called trilobites were common sea animals. They were oval and often measured 6 to 7 inches (15 to 18 centimeters) long. Trilobites became extinct by the end of the Paleozoic era.

The first fish appeared about 450 million years ago. These animals did not look much like fish today. They had armorlike shells and no jaws. Later fish developed jaws, a backbone, and fins.

Life on Land

By about 400 million years ago early plants had started growing on land. By the end of the Paleozoic era there were forests of large, treelike ferns. Huge

swamps also developed near the equator. In general, northern lands were dry and warm. Ice sheets covered the south.

Meanwhile, some of the arthropods in the oceans went through changes that let them live on land. They eventually evolved, or developed, into the first centipedes, insects, and spiders. Some fish also developed body parts that allowed them to live on land. They became amphibians, or animals that live both in water and on land.

Reptiles evolved from amphibians by about 300 million years ago. Reptiles were the first animals with a backbone to live entirely on land.

Mesozoic Life

The Mesozoic era followed the Paleozoic era. It lasted from about 248 million years ago to about 65 million years ago.

The first life-forms were very simple. Later forms were more complicated and more varied.

Large reptiles called dinosaurs dominated the land during this era. Some dinosaurs fed on palmlike plants and evergreen trees, which grew well in the mild to warm climate. Other dinosaurs preyed on other animals. Large reptiles also lived in the oceans and flew in the air.

Mammals evolved from reptiles during the Mesozoic era. The earliest mammals appeared by 200 million years ago. They were small, shrewlike creatures.

Birds also appeared during the Mesozoic era. They evolved from reptiles by about 150 million years ago. The earliest birds had wings and feathers like modern birds. But they also had teeth and claws.

All dinosaurs became extinct by about 65 million years ago. But other reptiles, including the ancestors of snakes, turtles, crocodiles, and lizards, survived. Birds, mammals, insects, flowering plants, and other life-forms also survived.

Cenozoic Life

The next period in Earth's history is the Cenozoic era. It began about 65 million years ago and continues today.

Many mammals developed during this era. The first horses, rhinoceroses, pigs, hippopotamuses, camels, deer, giraffes, sheep, cattle, and apes appeared. By about 4 million years ago the ancestors of humans, called hominins, had appeared. Early forms of humans developed between 2 million and 1.5 million years ago.

Between 1.8 million and 10,000 years ago large ice sheets covered much of Earth. During four periods, known as ice ages, glaciers moved across the northern half of the planet. Long warm periods separated the ice ages. During this time such huge mammals as woolly mammoths, mastodons, and saber-toothed cats roamed the land. But by the end of the ice ages, most of the huge mammals had died out.

Early humans hunted mammoths and other animals. They made and used stone weapons and tools. For this reason this period of prehistory is known as the Stone Age. The Stone Age ended at different times in different places. It ended as humans began to farm, settle in villages, and make tools out of metal. About 5,000 years ago humans began to write. Prehistory then ended, and human history began.

Presley, Elvis

Elvis Presley was a famous popular-music star in the United States. He was one of the first musicians to sing and play rock music. For this he is often called the King of Rock and Roll.

Elvis Presley was born on January 8, 1935, in Tupelo, Mississippi. His family was very poor. In the late 1940s the Presleys moved to Memphis, Tennessee. As a young man Elvis enjoyed many

Did You Know?

Many animals died out in historical times. They include the dodo bird of Mauritius and the passenger pigeon of North America.

Elvis Presley

different kinds of music, including gospel, blues, and country.

In 1953 Presley went to Sam Phillips' music studio to make a recording for his mother. Phillips had recently started the Sun Records label. He liked Presley's singing. In 1954 Presley made his first recordings for Sun, including "That's All Right Mama," which became a local hit.

In 1955 Presley began recording with RCA Victor, a major record label. Presley's early hits included "Don't Be Cruel," "All Shook Up," and "Hound Dog." He released his first number-one record, "Heartbreak Hotel," in 1956.

Presley became an actor in 1956. His first movie, *Love Me Tender*, was released in that year. He went on to star in more than 30 films.

In 1958 Presley entered the U.S. Army. In 1960 he returned to the United States and continued recording, performing, and acting. In the 1970s Presley had problems in his personal life. When not performing, he spent almost all of his time at Graceland, his mansion in Memphis. Presley died on August 16, 1977.

Pretoria

Population
(2005 estimate),
urban area,
1,282,000

The country of South Africa has three capitals—Pretoria, Cape Town, and Bloemfontein. Pretoria is home to the president's office and many other government offices.

Pretoria lies on the Apies River. The city is famous for its jacaranda, a type of tree that has purple flowers.

Most people in Pretoria work for the government or in trade, banking, or other service industries. Factories in the city make metal products, processed foods, cars, and other products.

A people called the Boers founded the city in 1855. The Boers were descen-

Pretoria has many tall buildings and several large parks.

dants of earlier Dutch settlers. The city was named Pretoria after Andries Pretorius, a Boer leader.

In 1910 the country of South Africa was created. Pretoria became one of its capitals.

In 2000 Pretoria became a part of the Tshwane Metropolitan Municipality. The municipality governs Pretoria and surrounding cities. Tshwane was named after an African chief who lived in the area before the Boers arrived.

Primate

The primates are a group of mammals that includes some of the most intelligent animals. The major kinds of primates are humans, apes, monkeys, tarsiers, lemurs, and lorises. There are more than 300 species, or types, of pri-

mate. These different types have many physical features in common. For this reason scientists believe that they may share a common ancestor.

Where Primates Live

Humans live nearly everywhere in the world. Most other primates can be found in hot and warm regions of Central and South America, Africa, and Asia.

Nonhuman primates often live in trees.

Physical Features

Some primates are small, and others are large. One type of mouse lemur weighs only about an ounce (35 grams). On the other hand, a gorilla may weigh 600 pounds (270 kilograms).

The bodies of primates share many common features. For instance, primate brains are large compared to the size of their bodies. The brains of humans, apes, and monkeys are especially large and complex. Primates also have eyes that face forward. The view from one eye overlaps the view from the other eye. This helps primates judge the depth and distance of what they see. Special nerve endings in the hands and feet give primates a good sense of touch.

Most primates have thumbs that can bend to meet the other fingers. This allows them to grasp things with their hands. All primates except humans have big toes that can bend and grip in this way, too. Most types also have flat nails on their fingers and toes rather than claws.

Feeding and Reproduction

Primates eat a variety of plants and animals. These may include fruits, flowers, leaves, birds' eggs, insects, and other small animals.

Over the course of their lives, female primates tend to have fewer young than other animals do. Most primates give birth to one baby at a time. The babies take a long time to grow into adults. Primates must take care of their young for much longer than other animals do.

Deep emotional bonds often develop between mother and child.

Primates Under Threat

While the human race keeps getting larger, some other primates are in danger of dying out. Human activities such as logging and farming have destroyed the habitats of some primates. Hunting is another threat to many species.

Prince Edward Island

Prince Edward Island is Canada's smallest and most crowded province. The British named the island after Prince Edward, a son of King George III. The capital is Charlottetown.

Geography

Prince Edward Island is on the east coast of Canada. The province of Nova Scotia lies south and east of the island. It protects the island from the Atlantic Ocean. The Confederation Bridge connects Prince Edward Island to New Brunswick, to the west. Bays cut deeply into the long, narrow island. Most of the island is a gently rolling plain with soil that is good for growing crops. Tiny islands dot the coastline. Sandy beaches attract tourists in the summer.

People

Most of the people of Prince Edward Island are Canadians of Scottish, English, Irish, or French heritage. Some are descended from Loyalists (American colonists who did not want independence from Great Britain) who settled on the island after the American Revolu-

The red cliffs of East Point line the shore at the eastern end of Prince Edward Island.

tion. There are small numbers of American Indians and people with other European or Asian ancestors.

More than half of the people live in rural areas. Still, the island has more people per square mile than any other Canadian province. The port city of Charlottetown is the island's center of government, business, and culture. It is also home to the University of Prince Edward Island. Every summer the city stages a musical based on the children's novel *Anne of Green Gables*, which is set on Prince Edward Island.

Economy

Government services are the largest part of Prince Edward Island's economy. Finance, health care, and retail services

are also important. Technological and scientific services are growing, as is tourism. Manufacturing, especially food processing, is the chief industry.

Farmers grow potatoes, grains, and vegetables. They also raise cattle, pigs, and poultry. Fishers catch lobsters, oysters, fish, and other seafood. The province's forests provide wood for lumber and paper.

History

In early times Micmac Indians from the mainland used the island for fishing, hunting, and planting. The Italian explorer John Cabot may have become the first European to see the island in 1497. The French explorer Jacques Cartier definitely saw the island in 1534.

Another French explorer, Samuel de Champlain, claimed the island for France in 1603. Settlers from France did not arrive until 1720. French speakers from the mainland also set up small communities on the island. The French called the island Île Saint-Jean.

In 1758 British forces occupied the island, and most of the French settlers left. The British governed the island as a part of Nova Scotia. In 1769 they made the island a separate colony. They later renamed it Prince Edward Island.

In 1864 representatives of several provinces met on the island, at Charlottetown, to discuss a plan of confederation, or union. A new country called the Dominion of Canada was formed in 1867. For its early role in the union of

The Confederation Bridge crosses the Northumberland Strait to connect Prince Edward Island with New Brunswick. The bridge is 8 miles (12.9 kilometers) long.

Canada, the island is sometimes called the Cradle of Confederation. However, Prince Edward Island did not join the union until 1873.

At that time many of the island's landowners lived in England. They charged rent to their tenants, or the people living on the land. A law passed in 1875 made it possible for tenants to buy the land. However, the island's economy remained poor. Many people moved away to find work.

Many changes came to Prince Edward Island in the 1900s. Roads, cars, ferries, a radio station, and air service arrived by the 1950s. Tourism helped the economy to grow. The Confederation Bridge to the mainland opened in 1997.

Printing

A huge press prints many copies of a newspaper on a long roll of paper. Other machines will cut the roll into sheets.

Printing is a way to make many identical copies of texts and images on paper. Printing began as a way to speed up the process of making copies of books. At first this was a very slow process because it involved copying the text by hand. With the invention of a machine called the printing press, printing became faster and easier. Modern printing by computers can produce hundreds of pages in minutes. People use printing to create books, magazines, money, stamps, maps, posters, billboards, and labels.

Printing Methods

The most common type of printing is electronic printing. It is also known as computer or digital printing. In this method, a writer, editor, or designer creates pages on a computer screen.

Next, laser printers (photocopiers controlled by laser beams) use heat and powdered ink to form an image of the page on a sheet of paper.

Most books are printed from printing plates. In this method, printers transfer the image of several pages to a metal or plastic plate. They may do this by computer or by hand. Next they place the plate in a printing press and put ink on it. Then they feed paper into the printing press. The press transfers the ink onto the paper.

On older kinds of printing plates, all the words and pictures are reversed, as if seen in a mirror. On some older plates, the words and pictures are raised above the surface of the plate. Ink applied to the plate sticks to the raised areas. On other plates, the words and pictures are engraved on, or cut into, the plate. Ink then collects in the cut-out areas.

On newer kinds of printing plates, the image is flat. Special ink sticks to the image but not to the rest of the plate. The inky image is transferred onto a

An artist of the 1800s imagined Johannes Gutenberg and a printer in their workshop.

sheet of rubber. The rubber sheet then prints the image onto paper. Because the image is transferred twice, the words and pictures on the plate do not have to be reversed.

History

By the AD 700s people in China were using carved wooden blocks to make prints. They applied ink to the block and then pressed the block onto paper. This technique was used to make the *Diamond Sutra* in 868. It is the first known printed book.

In the 1400s in Germany, Johannes Gutenberg invented a printing press that could make copies of whole pages of text. Gutenberg arranged type (metal blocks with raised, reversed letters on them) on a tray. He rubbed ink on the raised surface of the type. He then used the machine to press a sheet of paper against the inky type. Gutenberg's invention could easily print many copies of a page—and even copies of a whole book.

The printing press created a communication revolution. Before this time, people copied books by hand. It was a slow process, so there were few books available. After the invention of the printing press, more books could be printed and sold. Printing also led to the creation of newspapers.

Prism

A prism shows that white light is actually a combination of many colors.

A prism is a piece of glass or other see-through material that has several flat sides, called faces. Many prisms have three long faces in between two triangle-shaped ends. However, prisms can be made in many forms and shapes. People use prisms to bend light.

Light travels through space in the form of waves. Scientists use an idea called wavelength to describe these waves. Some light waves have long wavelengths, while others have short wavelengths. Each wavelength produces a different color of light.

Usually all the wavelengths of light blend together to form white light. But when light enters a prism, it bends. Light waves of different wavelengths bend by different amounts. The longest wavelengths bend the least. The shortest wavelengths bend the most. This bending separates the light waves so each color can be seen. This band of colors—red, orange, yellow, green, blue, indigo, and violet—is called a spectrum.

Prisms may be found in binoculars, microscopes, and many other instruments. They help to bend the light that enters these instruments toward the viewer's eyes. Scientific instruments called spectroscopes use prisms to separate the energy given off by light sources, such as stars. Each chemical that makes up a star produces a different wavelength of light. Scientists can measure the different wavelengths to tell what the stars are made of.

Prison

Prisons are buildings that hold people who have been convicted, or found guilty, of serious crimes. Of all the world's countries, the United States and China have the most known prisoners.

Purposes of Prisons

Prisons serve three main purposes. They punish criminals by taking away their freedom. They also keep dangerous criminals off the streets. Finally, prisons can help to rehabilitate prisoners, or

make them into better people. Prisons do this by giving prisoners an education, job training, or help in getting over the problems that caused them to commit crimes. These problems may include emotional problems, mental problems, or the abuse of drugs or alcohol.

Types of Prisons

Maximum-security prisons hold people who have been convicted of the most serious crimes—for example, murder or hurting someone with a gun, a knife, or another deadly weapon. Prisons built to hold less dangerous criminals are called minimum-security prisons. Jails are prisons for people who committed small crimes or people waiting for a trial. There are separate prisons for men and women.

History

Until the 1700s most prisons were not used for punishment. Instead of prison, common punishments included death and banishment (sending a person out of the country). Prisons mainly held people who could not pay their bills, people waiting for a trial, and guilty people waiting to be given their sentences, or punishments. By the 1900s, however, most prisons held convicted criminals.

The conditions in early prisons were horrible. Disease, violence, and abuse were common. In the late 1700s reformers (people who work for change) in the United States and Great Britain began to look for ways to improve prisons. By the 1900s many prisons offered prisoners rewards for good behavior, education,

and job training. Reformers today continue to work for safer and more effective prisons around the world.

Pristina

Pristina is the capital of Kosovo. It is located in the east-central part of the country.

Pristina is a cultural center for ethnic Albanians, who make up most of the population of Kosovo. A museum in the city teaches about the history and people of the area. Southeast of the city is the Gračanica Monastery. It was built in the 1300s and contains interesting frescoes, or wall paintings. The monastery is a religious center for Serbian Orthodox Christians.

The economy of Pristina relies on services, including trade, health care, government, and businesses that are related to tourism. Lead, silver, and zinc are mined in mountains near Pristina.

Pristina has a long history. It was the capital of all of Serbia, which included

Kosovo, until 1389. In that year the Turkish Ottoman Empire conquered Serbia. Serbia and Kosovo then developed different identities. Serbian leaders made Belgrade their capital.

Serbia eventually gained independence from the Ottomans and regained Kosovo. But by the late 1900s Kosovo wanted independence from Serbia. During fighting in the late 1900s and early 2000s several cities in Kosovo were heavily damaged. Pristina did not suffer as much damage. Many people moved to the city because of that. Kosovo declared its independence from Serbia in 2008 with Pristina as its capital.

Prometheus

In ancient Greek mythology Prometheus was a god of fire. He was also a trickster and a master craftsman. Prometheus was one of the Titans. The Titans were giants who once ruled the world.

In one story Zeus, the chief god, had Prometheus and his brother Epimetheus create the animals and people. Epimetheus made the animals first. He gave them all the best qualities, such as strength and speed. He also protected them with fur and feathers.

Epimetheus then realized that he had little left to give people. He asked Prometheus for help. Prometheus stole fire from the gods and gave it to humans.

In ancient Greek mythology, Prometheus stole fire from the gods and gave it to humans.

Zeus saw what Prometheus had done and became angry. He had Prometheus tied to a rock. Every day an eagle ate

Prometheus' liver. Every night he grew a new liver for the bird to eat the next day. Eventually the hero Heracles (or Hercules) freed him.

Zeus also punished humans after Prometheus gave them fire. Zeus sent the first woman, named Pandora, to Earth. Her curiosity is said to have brought troubles into the world.

Protective Coloration

Some animals have special colors or markings called protective coloration. These markings protect animals from predators, or animals that will eat them. Some markings are a kind of camouflage, meaning that they help the animal blend in with its surroundings. Others help scare predators away by making the animal appear dangerous.

Camouflage

Many animals have body colors that match their usual surroundings. This helps them to hide from predators. Snowshoe hares, for example, have white fur in winter to blend in with snow. For the rest of the year their fur is brown, to match the ground. Insects known as walkingsticks are long, thin, and green or brown. Their color and shape make them look like parts of the plants on which they feed. Some animals, such as cuttlefish, can even

A toad's coloring allows it to blend in with a clump of leaves.

change their color and pattern to match their surroundings.

Spots, stripes, and other color patterns help to mask the true shape of some animals. For example, the stripes on zebras make it hard for predators to tell exactly where each zebra is. But patterned fur also helps some predators. The spots or stripes of many big cats help them to hide as they move closer to their prey.

Warning Colors

Some animals use color to warn others not to bother them. These animals often have poison or other weapons to defend themselves. Some poisonous snakes and frogs are brightly colored. Bees, which are known for their stings, often have bold stripes of yellow and black. Predators may avoid these animals because they have learned to associate bright colors with pain.

Some harmless animals have the same colors as dangerous or bad-tasting animals. These colors trick predators into

staying away. This type of coloration is called mimicry.

How Coloration Develops

Animals gain helpful traits through a process called natural selection. If an animal happens to be born with such a trait, it is more likely than others to survive. It therefore has a better chance of having offspring. If the animal passes on the trait, the offspring, too, will have a better chance to survive. They can pass on the marking or coloring to their own offspring. After many generations, the entire population has the useful trait.

Protestantism

With more than 400 million followers, Protestantism is the second largest branch of Christianity. Protestantism is divided into many different churches. The first Protestant churches broke away

Women serve as ministers in some Protestant churches. Other Protestant churches accept only men as ministers.

Did You Know?

Three leaders of the Reformation were Martin Luther, John Calvin, and King Henry VIII of England.

from Roman Catholicism, the largest branch of Christianity.

Beliefs and Practices

Although many Protestant churches have different beliefs, all Protestants reject Roman Catholicism and the power of its leader, the pope. They base their beliefs on the Christian Bible. Most believe that getting to heaven requires only faith in God, not any specific actions. They think that each believer, not just priests, can spread God's teachings.

Most Protestant churches hold worship services on Sundays. Protestants perform only two of the sacraments, or rituals, practiced by Roman Catholics: baptism and Communion.

History

In the 1500s some Roman Catholics began to disagree with their church. At first they wanted only to change, or reform, parts of the church. Their movement became known as the Reformation. But the leaders of Roman Catholicism strongly opposed such changes. Soon some people broke away to form new churches. Members of the new churches became known as Protestants. The first Protestant churches to form were the Lutheran church, the Church of England, and the Reformed, or Presbyterian, churches.

Catholics and Protestants fought wars over religion in the 1500s and 1600s. Protestantism remained strong, however, and spread throughout Europe and its colonies.

In the 1600s and 1700s some Protestants thought that Protestantism was still too close to Roman Catholicism. Some of them formed new Protestant groups, such as Congregationalists, Baptists, Quakers, and Methodists.

In the 1800s missionaries spread Protestantism further in the Americas, Africa, Asia, and Oceania. New Protestant churches continued to form in the 1800s and 1900s. Meanwhile, beginning in the 1900s, some Protestants worked to build unity with all Christians.

Protist

Protozoans, algae, and slime molds belong to a group of living things called

A layer of slime mold covers leaves and a wet log.

protists, or protoctists. Protists are not animals, plants, fungi, or bacteria. Many protists are so small that people can see them only through a microscope.

There are thousands of different species, or types, of protist. Many types live in water, both in oceans and in freshwater. Others live on land. Some, called parasites, live inside the bodies of animals. Some types are solitary—they do not form groups with other protists. Other types form groups called colonies.

Most protists are unicellular, which means that they have just one cell. Some protists are made up of clusters of cells. But a protist never has more than one type of cell.

Some protists act like animals. For example, some types of protozoan move around and feed on other living things. Other protists act more like plants. They make their own food through a process called photosynthesis, just as plants do. Many plantlike protists are called algae.

The protists called slime molds can act like animals or like fungi (such as mushrooms). Sometimes slime molds move around as unicellular creatures, as protozoans do. But at other times slime mold cells gather together. They form a slimy layer that moves across forest floors or other surfaces. This slime feeds on decaying plants and other living things. Sometimes small stalks grow out of the slime. The stalks release spores, as fungi

do. These spores are tiny units that turn into new slime mold cells.

Protozoan

The remains of a protozoan that lived long ago are preserved in rock as a fossil.

Protozoans are simple organisms, or living things. They belong to a group of organisms called protists, which are neither plants nor animals. Most protozoans are so tiny that they can be seen only with a microscope. Amoebas and paramecia are types of protozoan.

Protozoans are found all over the world, on land and in water. Protozoans living on land especially like moist soil. Some protozoans are parasites. They live inside the bodies of animals, including humans. Parasitic protozoans can cause disease.

A protozoan is just a single cell. But it can do all of the things that organisms with many cells can. A protozoan can

eat, grow, reproduce, and get rid of wastes. Most protozoans can move, too.

Protozoans have different shapes, but they all have some features in common. Like all cells, every protozoan is made up of a jellylike material called cytoplasm. Within the cytoplasm is at least one nucleus. The nucleus directs the functions of the cell. The cytoplasm also contains special organs that do certain jobs, such as digestion or making proteins. Some protozoans have hairlike or whiplike structures that help them move.

Most protozoans reproduce themselves without a partner. Usually the nucleus pinches in the middle to create two halves. The halves pull apart with equal amounts of cytoplasm to form two separate organisms.

Providence

Population
(2000 census)
173,168;
(2007 estimate)
172,459

Providence is the capital of the U.S. state of Rhode Island. It lies at the head of Narragansett Bay, which is part of the Atlantic Ocean.

Big houses stand on a hillside in Providence, Rhode Island.

Providence is a busy seaport. It is also one of the main industrial centers in New England. It is among the region's leaders in the production of machinery, jewelry, and silverware. Government, health care, banking, and other services also bring money to the city. It is home to Brown University and several colleges.

The English settler Roger Williams founded Providence in 1636. He made the town a center of religious freedom.

Providence played an important role in the American Revolution. In 1775 the city had a protest called a tea party. People burned British tea to protest against taxes on tea. During the war many American troops lived in the city.

In 1854 both Providence and Newport became state capitals of Rhode Island. In 1900 Providence became the state's only capital.

Rhode Island

Prussia

Prussia was a historical region in Europe that bordered the southeast coast of the Baltic Sea. It was known for its powerful army. In 1871 Prussia united several German states to create the empire of Germany.

Beginnings

The first Prussians were tribes of hunters and cattle raisers. They were related to the Latvians and the Lithuanians. In the 1200s the Teutonic Order, a group of German-speaking knights, conquered the Prussians. The knights brought Christianity to the Prussians.

During the 1400s Poland and Lithuania defeated the Teutonic knights in a series of wars. Prussia was then divided into East Prussia and West Prussia. The king

Otto von Bismarck was the Prussian leader who created the modern country of Germany.

of Poland ruled the western part directly. He ruled the east through the Teutonic Order.

In 1526 the grand master of the Teutonic Order dissolved the order. He accepted Polish rule and changed East Prussia into the territory of a duke. The territory merged with another German state, called Brandenburg, in 1618.

Kingdom

In 1660 Frederick William of Brandenburg ended all Polish control over East Prussia. In 1701 Frederick William's son crowned himself as the first Prussian king, Frederick I.

Frederick I's grandson was Frederick II, who is known as Frederick the Great. He took West Prussia back from Poland in 1772. Under his rule, Prussia became a major power.

In 1848 some Prussians tried to start a revolution against King Frederick William IV. They wanted the people to have a say in the government. The king stayed in power, but he gave Prussia a constitution in 1850. The constitution created a parliament, or legislature. The people elected some of its members.

Empire

In 1862 Otto von Bismarck, a member of the Prussian parliament, gained a leading role in the government. He created a plan to bring Prussia and some other German states together as one German empire. In January 1871 the king of Prussia became Emperor William I of Germany.

Did You Know?

Frederick II also improved Prussia's educational system and supported the arts.

The End of Prussia

William II, also known as Kaiser Wilhelm, became emperor in 1888. He led Germany into World War I. Germany lost the war, and in 1918 the winners forced William II to give up his position. Germany became a republic—a country led by the people, not by a king. Prussia lost territory. It also lost power in Germany's government. By 1947, after World War II, Prussia no longer existed.

Psychology

Psychology is the scientific study of the ways that people think, feel, and behave. Like anthropology and sociology, psychology is called a social science. Scientists trained in psychology are called psychologists. Psychologists study the human mind and emotions to try to understand the reasons behind people's actions.

Some kinds of psychologists talk with people to help them deal with emotional problems.

The Rorschach test is one tool that psychologists use to learn about personality. The psychologist shows a person inkblots, and the person describes what they look like. Different kinds of people see different things in the inkblots.

There are several different branches of psychology. Clinical psychology is the largest branch. Clinical psychologists treat people with mental illnesses and emotional problems.

Psychologists who work in other branches of psychology do experiments and research. Some study what happens in the brain when people think and feel. Others study how people react to others. Certain psychologists compare the human mind to the minds of other animals, especially apes and monkeys.

To do their work, psychologists often observe, or watch, people. For example, a psychologist may observe children at play to see how they get along. Psychologists also may ask people to answer questions or to do different tasks. By comparing the actions and responses of many different people, psychologists hope to find patterns. These patterns

may help to explain why people think or act as they do.

Pterodactyl

Pterodactyls were flying reptiles of prehistoric times. They lived about 145 to 65 million years ago, at the same time as the dinosaurs. Remains of pterodactyls have been found all over the world.

As far as scientists know, pterodactyls were the largest flying animals that ever lived. Some pterodactyls measured more than 36 feet (11 meters) across with the wings spread out. But the smallest pterodactyls were as small as a sparrow.

A pterodactyl's back legs were long and thin, like those of birds. Pterodactyls also had long beaks. But unlike birds, pterodactyls did not have feathers. Their wings were made of skin, like those of

bats. Pterodactyls probably did not fly by flapping their wings constantly. Instead they probably glided on air currents.

Pterodactyls were meat eaters. Many had hooked claws and sharp teeth that they used to grab and hold onto prey. Pterodactyls that lived near water fed mostly on fish. Pterodactyls that lived far from water ate small animals.

Public Health

The term public health describes efforts to keep a whole community healthy. Local and national governments run many public-health programs. These programs improve living conditions and give people longer lives.

Public health includes many different health services. Some programs work to prevent and to fight disease. Vaccination is an important part of these efforts. A vaccine is a substance given to people to protect them from illness. Other programs focus on fighting pollution or keeping food and water safe. Public health also involves teaching people about exercise and healthy eating.

Public-health programs started to appear in the 1700s and 1800s. Before that, health was mostly a personal or local issue. But as the populations of cities and countries grew, the number of health problems grew, too. Governments began to see the need for keeping the

Did You Know?

Obesity, an extreme form of being overweight, has recently become a major public-health issue in the United States.

A fossil skeleton shows that pterodactyls must have looked like giant birds. But scientists do not believe that birds came from pterodactyl ancestors.

People wait in line to get flu shots. Such shots can prevent diseases from spreading to many people in a community.

public healthy. Today most countries have their own public-health programs. In the United States, the Department of Health and Human Services oversees many public-health agencies.

The World Health Organization (WHO) promotes the health of people around the world. It works to stop the spread of polio, AIDS, and other diseases. Its vaccination programs helped rid the world of smallpox. The WHO also warns travelers about diseases in certain countries.

Pueblo

The Pueblo are a group of Native American tribes that live in northeastern Arizona and northwestern New Mexico. Early Spanish explorers gave them the name Pueblo, which is Spanish for “village” or “town.” The explorers were impressed by the villages that the Indians

had built. Today the term pueblo is used for both the people and their villages.

The Pueblo built large houses that had several stories, like apartment buildings. They used blocks of adobe, or sun-baked clay. The Pueblo got most of their food from farming. Their main crop was corn. Early Pueblo also hunted and gathered wild plants to eat.

The Pueblo are descendants of the ancient Anasazi people. Some of their villages were already hundreds of years old when Spanish soldiers arrived in 1540. The Spanish gave the Pueblo metal tools and cloth. They also brought horses and new crops such as wheat and chili peppers.

Later Spanish rulers were cruel to the Pueblo. In 1680 a Pueblo leader called Popé led a rebellion against the Spanish. The Pueblo drove the Spanish from their lands for 12 years. When the Spanish returned they had more respect for the Indians. Their rule was not as harsh.

A photograph from the early 1900s shows adobe houses built by the Zuni, a group of Pueblo Indians.

At the end of the 20th century there were about 60,000 Pueblo Indians. They lived in 19 pueblos. Unlike many other Indians, modern Pueblo have mostly been able to keep their traditional way of life.

Puerto Rico

Puerto Rico is an island in the Caribbean Sea. It is a commonwealth of the United States. This means that Puerto Rico governs itself but keeps some ties with the United States. The capital of Puerto Rico is San Juan.

Puerto Rico is part of the island group called the West Indies. The island is roughly rectangular in shape. It is mostly mountainous, but the land along the coast is flatter. The weather is warm year-round.

Most Puerto Ricans have Spanish ancestors. People of African descent make up a smaller group. Some people have mixed European and African roots. Most Puerto Ricans speak Spanish, and

many speak English as well. Most of the people are Christian.

Puerto Rico's main sources of income are manufacturing, services, and trade with the United States. Factories make chemicals, medicines, electronics, machinery, and clothing. Finance and tourism are major service industries. Farms produce sugarcane, tropical fruits, coffee, beef, pork, chickens, milk, and eggs.

Arawak Indians known as the Taino arrived in what is now Puerto Rico by AD 1000. The first European to reach the island was Christopher Columbus. He claimed it for Spain in 1493. In the late 1700s the Spanish started to set up large farms called plantations. They brought in Africans to work on the plantations as slaves. Sugarcane, coffee, and tobacco were the major crops.

In 1898 Spain gave Puerto Rico to the United States after losing the Spanish-American War. In 1917 the U.S. government made the people of Puerto Rico

People celebrate a religious festival in Puerto Rico by putting on costumes and masks.

citizens of the United States. Puerto Rico became a commonwealth in 1951. Puerto Ricans have most of the benefits of U.S. citizenship. However, they cannot vote for the U.S. president.

Pulaski, Casimir

Casimir Pulaski

Casimir Pulaski was born in Poland, but he became a military hero in the American Revolution. He stated his reasons for joining the revolution in a letter to General George Washington: “I came here, where freedom is being defended, to serve it, and to live or die for it.” He paid for his beliefs with his life.

Early Life

Pulaski was born on March 4, 1747, in Winiary, Poland. In his 20s he fought

against the Russians, who threatened his homeland. Pulaski later moved to France.

Pulaski met Benjamin Franklin in Paris, France, in December 1776. Franklin was looking for experienced volunteers to help fight for American independence from Great Britain. Pulaski agreed to help and sailed to America. He arrived in June 1777.

Military Career

During the American Revolution Pulaski impressed other soldiers with his skills as a cavalryman. A cavalryman is a soldier who fights on horseback. Pulaski showed great courage at the battle of Brandywine in Pennsylvania in September 1777. Pulaski led a cavalry charge against the British, who were winning. His actions allowed General Washington to escape with his troops.

In 1778 Pulaski formed a cavalry group known as the Pulaski Legion. The division included French, Irish, Polish, and German soldiers. Pulaski trained them in battle drills on horseback. He later became known as the Father of the American Cavalry.

Pulaski’s last battle was the battle of Savannah in 1779. On October 9, 1779, Pulaski was shot in the leg. He died two days later on a ship on its way to Charleston, South Carolina.

Puma

The puma is sometimes called the mountain lion because it is at home in the mountains.

The puma is a large cat of North and South America. It is also commonly called a mountain lion, cougar, or panther. It is about the same size as a jaguar. Its scientific name is *Puma concolor*.

Pumas live in a wide variety of habitats from southern Alaska to southern Argentina. Most of the pumas in North America live in the mountains of the western United States and Canada. Some pumas live in Florida.

Pumas can be up to 6 feet (1.8 meters) long, not including the tail. They stand about 2 to 3 feet (0.6 to 0.9 meter) tall at the shoulder and weigh about 80 to 220 pounds (36 to 100 kilograms). They may be yellowish tan, reddish brown, bluish gray, or some other color.

Pumas are powerful jumpers who attack their prey by leaping onto its back. From the ground, pumas can jump to heights of more than 18 feet (5.5 meters). Pumas mainly eat deer, but their diet also includes other small or medium-sized animals.

For many years people killed pumas because they sometimes attacked live-stock. Now pumas are protected in many places by laws that limit or ban hunting of the animals.

Pumpkin

Pumpkins are fruits that are commonly grown for food. The inside is cooked and eaten or used to make breads, soups, and pies. Pumpkins are related to squashes, gourds, cucumbers, and melons. Some types of pumpkin are called squashes.

Pumpkins are grown throughout North America and Europe. They grow on plants that have very long vines. The plant has rough, heart-shaped leaves and large yellow flowers.

Pumpkins usually weigh 9 to 18 pounds (4 to 8 kilograms). The largest varieties may weigh 75 pounds (34 kilograms) or more. Pumpkins are generally round.

Pumpkins grow on long vines.

But some may be flattened or stretched out on the top and bottom. The color is usually yellowish to orange. The rind, or skin, is smooth. Ridges run from the top to the bottom.

Pumpkins are picked in autumn. They can be stored for a few months in a dry place. In addition to using pumpkins in cooking, people roast and eat pumpkin seeds. They also feed pumpkins to animals. In some countries a carved pumpkin, called a jack-o'-lantern, is a familiar Halloween decoration.

Purim

Purim is the most festive Jewish holiday. It is also called the Feast of Lots. The holiday celebrates a time when Jews in Persia (now Iran) escaped a plot to harm them. Purim usually falls in late February or early March.

In the 400s BC Haman, the Persian king's adviser, plotted to kill all the Persian

Jews. To choose a day for the killings, he drew lots (which means that he picked a day by chance). But the Persian queen, a Jewish woman named Esther, convinced the king to stop Haman. This story is told in the Book of Esther in the Bible.

On Purim Jews go to a synagogue and listen to a reading of the Book of Esther. Afterward family and friends have a festive meal. The celebration often includes acting out the story and playing games. People exchange gifts of food and give to the poor. They also eat pastries called hamantaschen, which means "Haman's pockets." The pastries are supposed to resemble Haman's three-cornered hat.

Puritans

Puritans were people who wanted to "purify," or simplify, the Church of England. This church had broken away from Roman Catholicism during a period called the Protestant Reformation. However, the Puritans felt that the Church of England had kept too many Catholic practices. Some Puritans, called Separatists, formed their own churches. Others just wanted to change the existing church.

Many officials in England did not approve of the Puritans. The king and other English people often mistreated the Puritans. They called the Puritans "roundheads" because they wore their hair short instead of in long curls.

Children dance in Jerusalem to celebrate Purim.

An artwork from the 1500s shows a Puritan family. The Puritans lived simply, with little decoration in their clothing or homes.

Puritans in America

In 1620 a group of Puritan Separatists, now called the Pilgrims, left England to escape mistreatment. They crossed the Atlantic Ocean in a ship called the *Mayflower*. After reaching North America, they founded Plymouth Colony in what is now Massachusetts.

Several years later, another group of Puritans left England to find religious freedom. They set up the Massachusetts Bay Colony in 1630. Both of these groups eventually became known as Congregationalists.

Puritans in England

In England the Puritan spirit spread throughout society. Although the king disapproved of the Puritans, many of the common people shared their beliefs. Many leaders in Parliament also listened to the Puritans.

In 1642 civil war broke out between supporters of Parliament and the king.

King Charles was defeated and later executed in January 1649. The Puritan leader Oliver Cromwell became England's new leader. Cromwell's government favored the Puritans. Several new Puritan groups, including the Quakers, first appeared during this time.

Cromwell died in 1658, and a new king took power in 1660. Puritans were once again mistreated. This period was called the Great Persecution. Finally, in 1689 the Act of Toleration gave Puritans the freedom to practice religion as they thought it should be practiced.

Pyramid

A pyramid is a large structure with four sides that usually slope upward and meet

at a point. The base of a pyramid is a rectangle, and the sides are usually triangles. People throughout the world have built pyramids at different times. The most famous pyramids were built in ancient Egypt more than 4,500 years ago. The pyramids of Mexico, Central America, and South America are also well known.

Egypt

The pyramids of ancient Egypt were tombs. Egyptian kings had themselves buried with gold and other treasure. They had pyramids built partly to keep out people who would steal the treasure. However, robbers broke into most, if not all, of the Egyptian pyramids in ancient times. About 80 pyramids have been found in Egypt, but some are now only rubble.

The Egyptians developed pyramids from an earlier type of tomb called a mastaba. Mastabas were rectangular tombs with flat tops. In about 2650 BC King Djoser had his architect, Imhotep, build a new

The pyramids of Giza were one of the Seven Wonders of the World in ancient times. They are the only one of the seven still standing.

type of tomb. Imhotep stacked six stone mastabas, each smaller than the one beneath it. The result was a pyramid with a stepped design. Less than 100 years later King Snefru built the first pyramid with smooth, sloped sides.

The Great Pyramid was built for King Khufu in about 2550 BC. It sits in a group with two smaller pyramids in Giza, Egypt. About 100,000 workers spent about 20 years building the Great Pyramid. They stacked about 2.3 million blocks of stone to a height of 471 feet (143 meters). Each of the blocks weighed about 2.5 tons. The workers probably hauled them up a dirt ramp.

The Americas

Many ancient peoples of Mexico and Central and South America built pyramids. They usually used dirt and stone. These pyramids typically have a stepped form with a temple or platform on top. The Maya built a famous pyramid called the Castillo in what is now southeastern Mexico. The people of the ancient city of Teotihuacán, in central Mexico, built the Pyramid of the Sun and the Pyramid of the Moon.

Pyrenees

The Pyrenees mountain chain forms a high, rugged barrier between Spain and France. The mountains stretch for 270 miles (430 kilometers) from the Mediterranean Sea in the east to the Atlantic Ocean in the west.

Many of the mountains in the Pyrenees are more than 9,000 feet (2,740 meters) tall. The highest peak is Pico de Aneto, which rises 11,169 feet (3,404 meters).

Snow covers many of the peaks year-round, especially those in the center section of the chain. Ancient glaciers, or moving sheets of ice, carved valleys throughout the Pyrenees. There are also many mountain lakes and some of the highest waterfalls in Europe. Forests cover the mountain slopes in the west. Fewer trees and other plants grow in the east, which is much drier.

Few people live at the Pyrenees' highest elevations. However, the tiny country of

Cows graze in the Pyrenees in Spain.

Andorra is nestled among peaks near the eastern end of the chain.

Farmers and ranchers tend crops and raise animals in the valleys and on the slopes of the Pyrenees. Major crops include corn, potatoes, fruits, hay, olives, grapes, and cereals. Animals include beef cattle, sheep, and goats. Visitors come to the mountains for their hot springs, as well as for winter sports, hunting, fishing, and hiking.

Throughout history the Pyrenees have separated Spain from the rest of Europe. The mountains made it difficult to travel between the two by land. No one made good maps of the Pyrenees until the 1800s. For this reason the Spanish became excellent sailors. They also developed ties with North Africa, which is separated from Spain by only a short stretch of the Mediterranean Sea.

Python

Pythons are giant snakes of Africa, Australia, South and Southeast Asia, and the Pacific islands. Pythons are constrictors. This means that they kill their prey by wrapping themselves around it and squeezing it until it dies. Boas also constrict, but pythons and boas are different kinds of snakes.

There are about 28 species, or types, of python. They live in a variety of habitats, from forests to open, rocky areas. Many species live near water.

A green tree python coils around a tree branch in Indonesia.

One type, the reticulated python, is the world's longest known snake. It reaches a length of up to 32 feet (10 meters). Smaller pythons include the ball, or royal, python, which generally reaches a length of only about 6 feet (2 meters).

Pythons tend to strike their prey suddenly from a hidden position. They grasp the prey in their teeth and then kill the animal by squeezing it to death. Large pythons generally eat small mammals and birds. Smaller pythons also eat amphibians and reptiles. After eating a large meal, a python may not need to eat again for weeks or even months.

Like most other snakes, pythons reproduce by laying eggs. After the female lays her eggs she coils herself around them until they hatch about two or three months later.

Qatar

Qatar is a small country in the Middle East. It is an emirate, a country ruled by a leader called an emir. The capital is Doha.

Geography

Qatar sits on a small peninsula on the eastern coast of Saudi Arabia. The Gulf of Bahrain and the Persian Gulf lie to the north, east, and west.

Qatar's land is mainly a low, flat desert. The weather is hot during the summer and warm the rest of the year.

Plants and Animals

Desert grasses and shrubs grow in Qatar's dry environment. Animals include geckos, desert hares, jumping rodents called jerboas, and many birds.

People

Most of the people who live in Qatar are immigrants. They came from other Arab countries, as well as Pakistan, India, and

Most men in Qatar wear traditional clothing. The long white shirt is called a *thobe*. A *ghutra* is a headdress made of cloth and held in place with a black rope.

Iran. Arabic is the main language. Most people are Muslims.

Economy

Qatar is a rich country because of its reserves of oil and natural gas. The country also produces chemicals and steel. Banking is important to the economy as well. Qatar's few crops include dates, melons, and tomatoes. Herders raise sheep, goats, and camels.

History

For centuries Qatar was a land of nomads (wandering herders) and small fishing villages. In 1868 the al-Thani family gained power.

In 1916 Great Britain took control of Qatar's foreign affairs. Qatar gained independence from Britain in 1971. Emirs from the al-Thani family ruled Qatar into the 21st century.

Quaker

Members of the Christian group known as the Society of Friends are called Quakers. They are dedicated to experiencing God personally rather than through clergy, such as priests or ministers. Quakers call the presence of God inside each person the “Inner Light.” They believe that the Inner Light guides them through life.

Practices

Quakers attend meetings to worship God. These meetings are open to everyone. The worshippers sit in silence, waiting for a message from God. Worshipers who hear a message share their thoughts with the others.

Quakers have a long tradition of working for peace and opposing war. They also oppose slavery, cruel treatment of

prisoners, and unfair treatment of women. Various Quaker groups organize relief and service projects throughout the world.

History

George Fox, an English preacher, founded Quakerism in the mid-1600s. He grew to believe that God could be found inside people rather than in church ceremonies. He and other preachers established groups that shared his beliefs. These groups later became the Society of Friends. Its members were called Quakers because many worshippers quaked, or trembled, with emotion during religious meetings.

The Quakers offended many Christian leaders because they refused to honor officials, take oaths, or pay for the upkeep of English churches. Government authorities fined some of the Quakers, took their property, and put them in prison. The Quakers flourished nevertheless. A law passed in 1689 granted freedom of worship to the Quakers and other groups in England.

At the same time some Quakers traveled to the North American colonies. In 1681 King Charles II of England gave a Quaker named William Penn land that became the colony of Pennsylvania. Many Quakers settled there. In the 1800s Quakers in the United States founded several colleges and universities that emphasized science. In the 1900s Quakerism spread to Africa and Europe.

Did You Know?

Quaker service groups in the United States and Great Britain shared the Nobel peace prize in 1947.

Quaker worship services are called meetings. A drawing shows a meeting that took place in the 1800s.

Quapaw

The Quapaw are Native Americans who once lived in eastern North America, along the coast of the Atlantic Ocean.

They later moved westward along with other related tribes, including the Osage, the Kaw, the Omaha, and the Ponca.

The Quapaw eventually settled in what is now Arkansas. The tribe itself is sometimes called the Arkansas.

The Quapaw lived in rectangular, bark-covered homes called longhouses. Longhouses were big enough to house several families. The Quapaw grew corn, gourds, pumpkins, sunflowers, beans, and squash. They also hunted such animals as bison (buffalo) and gathered nuts and berries.

In 1673 French explorers visited Quapaw lands. The French and the Quapaw became trading partners. But the French also brought diseases, such as smallpox and measles, that killed many Quapaw.

American settlers soon arrived in the area. In the early 1800s the U.S. government got the Quapaw to give up their

Arkansas lands. The Quapaw went to live among the Caddo Indians in Louisiana. However, floods soon drove them from their new home.

In 1833 the Quapaw moved to a reservation in Indian Territory (now Oklahoma). In the 1920s some Quapaw became wealthy because they were able to mine and sell lead and zinc found on reservation lands. At the end of the 20th century there were about 1,000 Quapaw living in the United States.

Quarrying

Mining is the removal of minerals from Earth's crust. Quarrying is the mining of stone, or rock used mainly for building. A quarry is a hole or a pit in the ground from which workers remove stone. During quarrying, workers cut or blast stone into smaller pieces. These smaller pieces of stone are easier to handle and can be used to make many things.

A Quapaw sash is decorated with colorful beads.

Many different machines, including trucks and cranes, are used in quarries.

Types of Quarried Stone

There are two basic types of quarried stone: dimension stone and crushed stone. Dimension stone is blocks or slabs (big rectangles) of stone that have been cut to a certain size. Granite and limestone are popular types of dimension stone. Crushed stone is much smaller than dimension stone. It is stone that has been broken into many small pieces.

How Quarrying Is Done

Workers take stone from a quarry by cutting, drilling, or blasting it. To get dimension stone, they use machinery that cuts or drills large pieces of stone off the walls of the quarry. Each long, heavy slab weighs thousands of pounds. Workers cut the slabs into smaller blocks before transporting them to the surface. To get crushed stone, workers use explosives to blast stone from the quarry's walls.

In ancient times people removed stone from quarries without the help of modern machines or explosives. For instance, the ancient Egyptians used such tools as picks, wedges, drills, and saws.

Uses of Quarried Stone

The ancient Egyptians quarried huge blocks of stone to build pyramids. The ancient Greeks and Romans created many buildings and sculptures with quarried stone, as did later peoples. Today businesses all over the world use quarried stone, and almost every country has quarries. People still use dimension stone to make buildings, monuments, and sculptures. They use it to build bridges, tunnels, and dams as well. People use crushed stone mostly to build roads and to make concrete.

Mining • Rock

A worker at a quarry cuts slabs of limestone into smaller blocks.

Quebec

The province of Quebec is different from the rest of Canada. The language and traditions of most of its people are French rather than English. The name Quebec comes from an Algonquian Indian word meaning “where the river narrows.” It was first used for the province’s capital, Quebec city, which is located at a spot where the Saint Lawrence River narrows.

Geography

Quebec is Canada’s largest province in area. It borders Ontario and Hudson Bay on the west. The Hudson Strait lies to the north. To the east are the Gulf of Saint Lawrence and the mainland part of Newfoundland and Labrador. To the south are New Brunswick and the U.S. states of Maine, New Hampshire, Vermont, and New York.

Most of Quebec’s people live in the lowlands near the Saint Lawrence River and in the region south of the river, which is part of the Appalachian Mountains. The Laurentian Mountains, north of the lowlands, are the oldest mountain range in the world. The rocky land north of the Laurentians has many forests, lakes, and rivers. In the far north, near Hudson Bay and Hudson Strait, are barren Arctic lands.

People

Most of Quebec’s people are of French origin. More than 80 percent speak French as their usual language. After the French, people of British descent are the most numerous. Other ethnic groups include Irish, Italians, Haitians, Chinese, Greeks, and American Indians.

Nearly half of Quebec’s people live in Montreal or its suburbs. Located on an island in the Saint Lawrence River, Montreal is the second largest city in Canada after Toronto.

Economy

Services and industry are the most important parts of Quebec’s economy. Most of the province’s workers are employed in such services as tourism, education, banking, real estate, and sales. The next largest group works in manufacturing. Factories in the province produce food and drinks, aircraft and other transportation equipment, electrical goods, chemicals, and paper. Quebec’s mines provide gold, copper, zinc,

Street signs in Quebec are mostly in French.

iron ore, and asbestos. River dams create electricity, which Quebec exports to other provinces and to the United States.

Most farming in Quebec is done in the south, near the Saint Lawrence River. The province leads all others in dairy farming. Quebec is also among the leading provinces in poultry, hog, and vegetable production. Maple sugar is a Quebec specialty.

History

The first people in what is now Quebec were American Indians and Inuit. Indian groups included the Iroquois, the Huron, and the Cree.

In 1534 the French explorer Jacques Cartier sailed up the Saint Lawrence River and claimed the lands he saw for his country. The region was called New France. In 1608 Samuel de Champlain

founded Quebec city. Montreal was founded in 1642.

The French turned New France over to the British in 1763, after losing the French and Indian War. The British renamed the land Quebec. In 1791 the British split Quebec into two parts: Upper and Lower Canada. Lower Canada was later renamed Canada East.

Canada East became the province of Quebec in 1867. It was one of four original provinces in the new country of Canada. Upper Canada became the province of Ontario.

Quebec's borders changed in the early 1900s. Ungava, a huge region between Hudson Bay and the Hudson Strait, became part of the province in 1912. But the province lost land to Newfoundland (now Newfoundland and Labrador) when a boundary line was drawn in 1927.

Quebec's French Canadians have not always gotten along well with Canada's English-speaking majority. In the 1960s some people in Quebec began to demand that Quebec become a separate country. In 1976 Quebec voters elected a government dedicated to independence. However, in 1980 and again in 1995 the people voted for Quebec to remain part of Canada.

Queensland

Queensland is the second largest of Australia's six states. (Western Australia is the largest.) Queensland is known for its sandy beaches, damp rain forests, open plains, and rugged highlands. Its tropical climate has earned it the nickname Sunshine State. Brisbane is the capital.

Geography

The Pacific Ocean borders Queensland on the north and the east. The state of New South Wales lies to the south, and the state of South Australia lies to the

southwest. The Northern Territory forms the western border of Queensland.

Mountains that rise 2,000 to 5,000 feet (600 to 1,500 meters) line Queensland's coast. A mountain range called the Great Dividing Range separates the eastern third of Queensland from the western part. The western part of the state is mostly dry plains. Dense rain forests of palms, pines, and other plants grow on the eastern coast. Off the coast of Queensland is the world's largest coral reef, called the Great Barrier Reef.

People

More than 3.5 million people live in Queensland. Most Queenslanders can trace their family history to Europe. A small number of people are Australian Aborigines. People from Southeast Asia, especially Vietnam, also have settled in Queensland.

More than 40 percent of Queensland's people live in Brisbane, in the southeastern corner of the state. This big city is a port on the Pacific Ocean.

Economy

Farming and mining are important to Queensland's economy. The main farm products are beef, sugarcane, wheat, and wool. Other crops include sorghum, corn, pineapples, and bananas. Queensland's mines produce coal, copper, silver, zinc, and lead.

Tourism also brings money to the state. Tourists come for the warm climate and sandy surfing beaches. Many visit the Great Barrier Reef and the rain forests.

Queensland is home to many animals. Kangaroos sometimes hop across roads, so people must drive carefully.

History

Aborigines have lived in what is now Queensland for at least 40,000 years. European explorers visited the area in the late 1700s and early 1800s. In 1824 Great Britain set up prison camps in what is now Queensland. Britain shipped many prisoners to these camps, which existed until 1840.

Free British settlers began to build settlements in the area in the early 1840s. At first Queensland was a part of the colony of New South Wales. In 1859 Queensland became a separate colony. The population soared after gold was discovered in the late 1850s. Many miners went to Queensland in the hope of striking it rich.

In 1901 Australia became independent from Britain. At the same time Queensland became a state of Australia.

Rabat

Population
(2004
estimate), urban
area,
1,622,860

Rabat is the capital of Morocco, a country in northern Africa. The city lies where the Bou Regreg River flows into the Atlantic Ocean.

Industries that provide services, such as banking and trade, are important to Rabat's economy. Many people work for the government. Factories in the city produce cloth, food products, and bricks. Craftspeople in Rabat make carpets and leather goods.

In ancient times the Romans created a colony in the Rabat area. In the 1100s the Muslim rulers of Morocco founded Rabat as a military camp. In the early 1600s Spain's rulers forced all Muslims to leave Spain. Many of them moved to Rabat and the nearby city of Salé. Later in the 1600s the area was a base for pirates. The pirates attacked ships off the coast of northern Africa.

In 1912 the French took control of most of Morocco. They made Rabat its capi-

Rabbit and Hare

Rabbits and hares are mammals with long ears. There are about 28 species, or types, of rabbit and about 30 species of

The jackrabbits of North America are actually hares.

hare. They all belong to the same animal family, called Leporidae. Because rabbits and hares look similar, people sometimes confuse them.

Where Rabbits and Hares Live

Different species of rabbit and hare live in different habitats around the world. Cottontails and jackrabbits live wherever they can find brushy shelter. Other types can be found on mountains, on plains, in marshes or swamps, and even in the snowy Arctic.

Physical Features

Both rabbits and hares have short tails. They also have large eyes, strong teeth, and sensitive noses. The upper lip is split.

Hares are usually larger and heavier than rabbits. Hares measure from 16 to 28 inches (40 to 70 centimeters) long. Rabbits may be from 8 to 20 inches (20 to 50 centimeters) long. In general, hares also have bigger ears and longer hind feet than rabbits.

The fur of hares and rabbits is often gray-brown in color. Many hares turn

white in the winter. Rabbits' coats are the same color year-round.

Behavior

Many rabbits and hares live alone. Some rabbits live together in underground burrows called warrens.

Rabbits and hares eat mostly plants. They can cause great damage to gardens and crops. Their natural enemies are flesh-eating birds, mammals, and reptiles. Rabbits and hares use their speed and jumping ability to escape from these predators.

Reproduction

Female hares may have two to three litters of babies each year. The newborns have open eyes and can hop within minutes. They can take care of themselves after only a few days.

Female rabbits also may have several litters each year. Newborns are blind and helpless. They stay with their mother for about three weeks.

Mammal

Many kinds of rabbits dig burrows, or holes, for shelter.

Raccoon

Raccoons are mammals of the Americas. They can be found in cities as well as in the countryside. There are seven species, or types, of raccoon. The most common is the North American raccoon.

The North American raccoon can be found in Canada, the United States, and

Shaggy fur keeps a raccoon warm in the winter.

South America. It prefers wooded areas near water, but it will live in other areas, including large cities.

Raccoons have short legs, pointed muzzles, or snouts, and small ears that stand straight up. Their small feet resemble slender human hands. North American raccoons are 30 to 36 inches (75 to 90 centimeters) long from the nose to the tip of the tail. They weigh about 22 pounds (10 kilograms). A large male can weigh more than 44 pounds (20 kilograms).

Raccoons have a pattern of dark fur around their eyes that looks like a mask. They also have bushy tails that have dark bands, or rings. Their bodies are covered with shaggy, coarse fur that is iron-gray to blackish in color. They are nocturnal omnivores, which means they are active at night and eat both plants and animals. Raccoons eat crabs, frogs, fishes, rodents, fruit, and plants, including crops. In cities they tend to eat garbage or anything else they can find.

Raccoons live high in hollow trees or at the tops of buildings in cities. In captivity raccoons can live up to 20 years, but most do not live more than 5 years in the wild. Many are killed by humans for their fur or because they are considered pests.

Mammal

Radar

Radar is a system that uses waves of energy to sense objects. It can find a faraway object and tell how fast it is moving. Radar is very useful because it can sense objects even at night and through thick clouds.

How Radar Works

A radar system is made up of a transmitter, a receiver, an antenna, and a display. The transmitter creates radio waves, which are invisible streams of energy. The antenna sends the waves out into the air. When the waves hit an object, they reflect, or bounce back, to the antenna.

The waves then pass to the receiver, which makes sense of them. By measuring how long it takes the waves to return, the receiver can tell how far away the object is. The receiver can also tell where a moving object is headed and at what speed. Sometimes it can tell how big the object is, too. The receiver sends this information to a display, or screen, for people to see.

Did You Know?

The word radar is short for radio detection and ranging.

In a radar system, an antenna sends out radio waves. The waves hit an object and bounce back to the antenna. A radar display then tells a person information about the object's distance, direction, and speed.

Uses

Radar is very useful. At airports, air-traffic controllers use radar to keep track of airplanes and direct their movements. Ships and airplanes use radar to navigate, or find their way. Militaries depend on radar to find and track targets. Weather forecasters use it to locate storms and help predict the weather. Police use radar to spot speeding automobiles. Radar can also be used to find buried objects.

History

Work with radar started in the 1930s. A Scottish scientist named Robert Watson-Watt developed a radar system in 1935. It was used to help protect Great Britain from air attacks. During World War II (1939–45) radar helped Britain, France, and the United States defeat Germany. Since then many improvements have been made in radar technology. Today computers help radar

systems provide more details about distant objects.

Weather

Radiation

Radiation is energy that moves from one place to another. Light, sound, heat, and X-rays are examples of radiation. The different kinds of radiation fall into a few general categories: electromagnetic radiation, mechanical radiation, nuclear radiation, and cosmic rays.

Electromagnetic Radiation

Electromagnetic radiation comes from atoms, the building blocks of all matter. Some of the particles that make up atoms have an electric charge. The motion of these charged particles produces energy that can be described as traveling as waves. These waves combine electricity and magnetism. They can

travel through empty space, like in outer space. They can also travel through air and even solid substances, such as glass. Through empty space, the waves travel at a speed of about 186,282 miles per second (299,792 kilometers per second).

Like all waves, electromagnetic waves have peaks and valleys. The distance from the peak of one wave to the peak of the next wave is called a wavelength. Different kinds of electromagnetic waves have different wavelengths.

From longest to shortest wavelength, the types of electromagnetic radiation are radio waves, infrared rays, visible light, ultraviolet rays, X-rays, and gamma rays. Radio waves are used for sending signals, including television and radio broadcasts. Microwaves are short radio waves that can be used to cook food in microwave ovens. Infrared radiation, or heat, is given off by warm objects. Infrared radiation from the sun

Electromagnetic radiation travels in waves. A wavelength is the distance from the peak of one wave to the peak of the next wave. Short wavelengths have a shorter distance between peaks than long wavelengths.

heats Earth. Visible light is all the wavelengths of electromagnetic radiation that the human eye can see. Different wavelengths of visible light are seen as different colors. Ultraviolet radiation is used by the skin to make a nutrient called vitamin D. X-rays are used to make a picture of something inside an object, such as bones inside the body. Gamma rays are used in medicine to kill cancer cells.

The shorter the wavelength, the more energy the radiation carries. The types with the most energy—ultraviolet radiation, X-rays, and gamma rays—can be harmful to the body.

Mechanical Radiation

Unlike electromagnetic radiation, mechanical radiation cannot travel through empty space. It can travel only through a substance, such as air, water, or solid objects. A common example of mechanical radiation is sound. Sound is produced by the back-and-forth motion of a vibrating object. This motion produces sound waves that travel away from the object. Sound travels more slowly than light does. This is why during a storm, the sound of thunder follows a flash of lightning. An earthquake produces another form of mechanical radiation. The shock waves created by an earthquake travel through Earth and cause the ground to shake.

Nuclear Radiation

Nuclear radiation comes from the nucleus, or center, of atoms. It is produced when the nucleus changes in some way. The nucleus of some types of

Did You Know?

By sending sound waves through the body, doctors can check on the health of a growing baby inside its mother.

Types of Electromagnetic Radiation

Radio waves, infrared rays, visible light, ultraviolet rays, X-rays, and gamma rays are all types of electromagnetic radiation. Radio waves have the longest wavelength, and gamma rays have the shortest wavelength.

atoms is unstable. An unstable nucleus can naturally change into another type of nucleus. When it does this, it shoots off nuclear radiation in the form of small particles or gamma rays. Atoms that give off radiation in this way are called radioactive. Nuclear radiation carries a lot of energy, so it can be dangerous.

Cosmic Rays

Cosmic rays are a type of radiation made up of tiny parts of atoms that speed through outer space. Cosmic rays can come from the sun, but most come from farther away in the galaxy. Some cosmic rays travel almost at the speed of light. Because they move so fast, they have very high energy. Scientists study cosmic rays to learn more about the makeup of the galaxy.

Radio

Radio is a way of sending sounds or other information through the air. The information is carried by invisible radio

Dish antennas pick up radio waves that carry many kinds of communication.

waves. Radio waves are used for broadcasting, or sending out, radio and television programs. Radar, cell phones, cordless telephones, wireless computer networks, and other forms of communication use radio waves, too.

How Radio Works

Radio waves are a type of radiation. Radiation is energy that moves. Like all waves of radiation, radio waves have a property called frequency. Frequency describes the number of waves that pass a given point each second.

Radio waves are sent out by a device called a transmitter. The transmitter turns talking, music, pictures, or other information into electric signals. The transmitter combines these electric signals with radio waves of a certain frequency. The waves spread out in all directions from an antenna connected to the transmitter.

The radio waves are picked up by an antenna connected to a device called a receiver. The receiver separates the electric signals from the radio waves. Then it turns the electric signal back into the original sounds or pictures.

A receiver that picks up waves that carry sound is called a radio. A radio sends the electric signal through speakers so the sound can be heard. Each radio station sends out radio waves of a certain frequency. A person changes a radio from one frequency to another to hear different stations.

Families of the 1930s had no television to watch. Instead, they gathered around the radio to listen to their favorite programs.

History

In the late 1890s several people began working on ways to send and receive electric signals using radio waves. An Italian scientist named Guglielmo Marconi got much of the credit for developing radio. In 1897 he started a company that developed several uses for radio.

The first radio station started broadcasting in Pittsburgh, Pennsylvania, in 1920. Within two years hundreds of radio stations were started. Radio was a major source of home entertainment until the mid-1950s. Then television became more popular.

In the early 21st century satellite radio got many people interested in radio again. Satellite radio was a new method of radio broadcasting. Instead of using antennas on the ground, satellite radio stations sent broadcasts from satellites, or spacecraft. Satellite radio stations provided crisp, clear sound. They also

could be heard over a much wider area than traditional radio stations could.

Railroad

A railroad, also called a railway, is a type of land transportation. In a railroad a train travels along a path of two metal rails, or tracks. A train is a row of wheeled cars that are linked together. The wheels of rail cars have a rim that keeps them on the rails.

A vehicle called a locomotive pulls most trains. A locomotive can be powered by an engine that burns diesel fuel or by electricity. The electricity comes from a third rail or an overhead wire. The train

operator, called the driver or engineer, usually sits in the locomotive.

Types of Trains

Trains can be divided into two types: passenger and freight. Passenger trains carry people. Freight trains carry goods.

Passenger trains have cars with seats. Many passenger trains also have dining cars, baggage cars, and even sleeping cars with beds. The speed of many large passenger trains is about 100 miles (160 kilometers) an hour. However, some trains in Europe and Japan can go more than 180 miles (290 kilometers) an hour.

Commuter trains (trains that carry workers into a city), subways (underground trains), and monorails (trains that run on one rail) are smaller passenger trains. They carry people shorter distances. These trains often do not have a separate locomotive. Instead, some or all of the cars have electric motors under the floor. The train operator sits in the front car.

Freight trains consist of locomotives and freight cars. There are many types of freight cars. Boxcars often carry packaged goods. Open hopper cars often carry coal. Covered hopper cars often carry grain. Tank cars carry liquids. Car carriers carry automobiles. Special flatcars carry trailers or freight containers. Some freight trains have 150 or more cars. Because they pull so much weight, freight trains usually move more slowly than passenger trains.

High-speed trains leave their station in London, England. They can go all the way to France through a railway tunnel that runs under the English Channel.

George Stephenson of England built the *Rocket* with his son, Robert, in 1829. It was the fastest steam locomotive of its time, with a speed of 36 miles (58 kilometers) per hour.

History

Before there were trains and locomotives, people used horses to pull carts along tracks. Europeans began using this early type of railroad in the 1500s. They used it to carry heavy loads to and from mines.

In 1803 Richard Trevithick, a British engineer, planned and built a locomotive that ran on steam power. Mining companies used it. In the 1820s another British inventor, George Stephenson, designed and built the first steam train to carry goods and passengers.

In 1869 the United States completed a railroad system that stretched all the way from the East Coast to the West Coast. This railroad was called the transcontinental railroad.

Between the 1930s and the 1950s, diesel engines replaced steam engines as the power source in most locomotives. Today freight trains operate throughout

the world. But in many countries trucks carry much of the freight that trains once did. Passenger trains are still common, too. However, airlines have taken passengers away from many railroads.

Transportation

Rain

Water has three forms. It may be a liquid, a solid called ice, or a gas called water vapor or steam. Rain is the liquid form of water that falls from the sky in drops.

Rain fills lakes, ponds, rivers, and streams. It provides the freshwater needed by humans, animals, and plants. If too much rain falls, however, dangerous flooding may happen.

How Rain Forms

Rain is a part of Earth's endless water cycle. At the beginning of the cycle, sunlight heats up water on Earth's surface. The heat causes the water to evaporate,

A tree frog enjoys the rain.

Did You Know?

The more rain-drops a cloud contains, the darker it becomes.

or to turn into water vapor. This water vapor rises into the air. As the water vapor cools, it turns back into water, in the form of droplets. The droplets form around dust and other particles through a process called condensation.

Clouds form from large numbers of these droplets. In a cloud, droplets come together with other droplets to form larger drops of water. Eventually the drops become too heavy to stay in the cloud. They fall to Earth as rain. Then the water cycle begins again.

Sometimes drops of water freeze into ice crystals in the clouds. Sometimes the ice crystals melt as they fall toward the ground. This is another way that rain forms.

Where Rain Falls

Rain falls almost everywhere on Earth. One of the world's rainiest places is Mount Waialeale in Hawaii. It rains about 350 days a year there. About 460 inches (1,170 centimeters) of rain fall there every year. One of the driest places on Earth is the Atacama Desert in Chile. It receives less than 0.04 inch (0.1 centimeter) of rain a year. It has not rained in some parts of this desert in hundreds of years.

Acid Rain

Rain washes dust and dirt from the air. But rain itself is not always pure. Sometimes polluting chemicals from cars, factories, and power plants become trapped in clouds. The rain from these clouds contains those harmful chemicals. This polluted rain, known as acid

rain, can damage plants, animals, people, and property.

Acid Rain • Cloud • Flood • Water

Rainbow

A rainbow is a multicolored arc, or curved line, in the sky. Most rainbows form when the sun's rays strike rain-drops falling from faraway rain clouds. Rainbows appear in the part of the sky opposite the sun, usually in the early morning or late afternoon. From inside to outside, the colors of a rainbow are violet, indigo, blue, green, yellow, orange, and red.

Sunlight travels through space in the form of waves. Scientists use an idea called wavelength to describe these waves. Some light waves have long wavelengths, while others have short wavelengths. Light waves with different wavelengths appear as different colors. Usually all light waves blend together to form white light. But when light waves

A rainbow arcs over a beach in Hawaii. A faint secondary bow is visible above the bright primary bow.

pass through raindrops, they separate. This happens because the raindrops bend light waves with different wavelengths by a different amount. The separated light waves appear as the colors of a rainbow.

The brightest and most common type of rainbow is called a primary bow. Sometimes a fainter rainbow forms outside the primary bow. This is called a secondary bow or, sometimes, a double rainbow. A secondary bow forms when the light bends twice inside the water drops. The first bend makes the primary bow, and the second bend makes the secondary bow. The colors in the secondary bow appear in the opposite order of the colors in the primary bow.

Rain Forest

Thick forests found in wet areas of the world are called rain forests. Most people are familiar with hot, tropical rain forests filled with trees that stay green year-round. But there are other kinds of rain forests, too. Temperate rain forests grow in cooler parts of the world, such as the northwestern United States and southern Australia. Monsoon rain forests have a dry season and trees that shed their leaves each year. They grow in Southeast Asia. The rest of this article will focus on tropical rain forests because they are important to the health of the entire planet.

Thick rain forest covers parts of the African country of Cameroon.

Where Tropical Rain Forests Are Found

Tropical rain forests grow around the equator in the hot, wet region called the tropics. They are found in parts of the tropics that get more than 70 inches (180 centimeters) of rain each year. Parts of South and Central America, western and central Africa, Southeast Asia, and Australia have tropical rain forests.

Features

Tropical rain forests can be divided into several sections. At the top of the forest is a thick layer called the canopy. It is formed by the spreading branches and thick leaves of tall trees. The canopy blocks much of the sunlight from the area below. The canopy can be between 100 and 170 feet (30 and 50 meters) above the ground. A few very tall trees stick up above the rest of the canopy. They are called emergent trees. Many

animals and insects live among the tree-tops of the canopy.

The section below the canopy is called the understory. It contains small trees, shrubs, and plants. Many of these are saplings (young trees). Their stems reach up toward the light. However, these smaller trees generally do not receive enough sunlight to grow into adult trees.

On the forest floor, bacteria, fungi, and insects help to break down dead plants and animals. This process creates a thin, rich top layer of soil that provides nutrients to the roots of the plants and trees. Because this layer of soil is thin, most of the trees have shallow root systems.

Life in Tropical Rain Forests

The trees found in tropical rain forests stay green all year, though they do shed

their leaves sometimes. Palms are among the most common trees.

Below the thick canopy, other plants have to compete with each other to get enough light. As a result, many plants use other plants to reach toward the sunlight. For example, woody plants called lianas attach to the stems of other plants and climb from the ground to the canopy. Mosses, ferns, and orchids may also attach themselves to larger plants.

Each area of the rain forest has thousands of species, or types, of animal. Many plant-eating animals live in the canopy—for example, monkeys, flying squirrels, and sharp-clawed woodpeckers. At the lower levels of the forest are animals that run, flutter, hop, and climb in the undergrowth. On the rain forest floor are such animals as chimpanzees, gorillas, elephants, pigs, deer, and leopards.

Tropical Rain Forests in Danger

Tropical rain forests grow in many poor countries. Some poor countries sell the wood and other resources of rain forests to make much-needed money. This often means that entire sections of the forest are destroyed. The loss of rain forests endangers many plants and animals that live nowhere else in the world. Some of these plants and animals may become extinct if their rain forest habitat is destroyed.

The destruction of tropical rain forests also affects the environment of the rest of the world. Through the process

Different kinds of plants grow at different levels of a tropical rain forest.

called photosynthesis, plants produce oxygen and absorb carbon dioxide gas from the atmosphere. Because the number of plants in tropical rain forests is so huge, the forests produce much of the world's oxygen, which all animals need to live. When forests are burned, massive amounts of carbon dioxide escape into the atmosphere. This carbon dioxide leads to a problem called global warming.

Ramadan

In the religion of Islam, the holy month of Ramadan marks when the prophet Muhammad received the words of the Koran. The Koran is the holy book of the Muslims, as the followers of Islam are called. Muslims observe Ramadan by praying, reading the Koran, and fasting.

Boys in Pakistan help to prepare meals that Muslims will eat after sunset during Ramadan.

Muslims fast by refusing to eat or drink anything during daylight hours. Small children, very old people, and people with illnesses are excused. After sunset, Muslims break their fast with prayer and festive nighttime meals. The end of the monthlong fast is celebrated as a festival.

Ramadan is the ninth month of the Islamic calendar. Since the Islamic calendar is based on the moon, Ramadan may occur in any season of the year. The 27th night of Ramadan is celebrated as the Night of Power, or Lailat al Kadr. On that night, it is said, God revealed the Koran. Ramadan officially ends when religious officials first see the new moon.

Rap

The musical form called rap is basically rhythmic, rhyming speech. Rap is the

most important part of a way of life called hip-hop culture. Many people call the music that rappers use hip-hop music.

Rap songs often tell stories about rappers and their backgrounds. Some rappers speak about racism and its effects on African Americans. Most rappers have been men. Some women, such as Queen Latifah, have become successful rap artists as well.

Rap began in the early 1970s in African American neighborhoods in New York City. The first rapper was probably a Jamaican deejay named Kool Herc. (Deejays play recordings at dance clubs.) Kool Herc used two turntables, or record players, to create sound for parties in the Bronx section of New York. As the music played he would “rap,” or talk, to the audience.

In time other deejays developed the rhyming musical speech that became rap. Early rappers included Afrika Bambaataa and Grandmaster Flash. In 1979 the Sugarhill Gang’s song “Rapper’s Delight” became the first hit rap song.

Rap artists perform for a crowd at an awards show.

During the 1980s rap mixed with other forms of popular music, including rock and soul. Some popular rappers during this time were LL Cool J, Run-D.M.C., the Beastie Boys, and De La Soul. Public Enemy performed rap songs with strong political messages.

In the 1990s a form of rap known as gangsta rap became popular. Gangsta rap songs by N.W.A., Ice-T, and other performers described the drug use, gangs, and violence found in inner cities. Other rappers continued to mix rap with other forms of music—for example, the Fugees used reggae, and OutKast used funk.

Raspberry

Raspberries are delicate, juicy fruits. They are eaten fresh. They are also canned, processed for jams, put into pastries, or frozen. Raspberries are a source of vitamin C, vitamin A, and iron.

Raspberries grow in the United States and Europe. They thrive in places where summer is not very hot and winter is not very cold.

Raspberries are usually red, purple, or black. They grow on prickly bushes

Each raspberry is actually a cluster of tiny fruits.

called brambles. The bushes produce small flowers that develop into the berries.

Botanists (people who study plants) do not consider raspberries to be true berries. True berries, such as cranberries and blueberries, are single fruits that develop from a single flower. But a raspberry is actually a cluster of small fruits that develop from a single flower. The small fruits are attached to a firm core. When a raspberry is picked, the core stays on the plant. This is why a picked raspberry is hollow inside.

Raspberries are similar to blackberries. But when a blackberry is picked, the core stays inside the fruit. Another difference is that raspberries are hairy but blackberries are smooth.

Rat

A mother rat protects her babies in the corner of a barn.

Rats belong to the group of mammals called rodents. They live throughout the world, either in the wild or around people. They usually stay out of sight by squeezing into tight hiding spaces.

Rats look like mice but are usually larger. A rat is usually about 7 to 10 inches (18 to 25 centimeters) long, not including the tail. The fur can be gray, white, black, or brown. Rats have sharp teeth. They use their teeth to defend themselves against birds, snakes, and other enemies.

Rats are most active at night. Rats in the wild eat leaves, branches, seeds, and roots. Some eat small animals. Rats living near people will eat almost anything that people eat. They also gnaw on all kinds of objects other than food, such as walls and telephone cables.

Rats can reproduce quickly. Females that are only a few months old can have

babies. A rat can have as many as 150 babies every year.

Many people think rats are pests. With their big appetite, rats can destroy crops and stored grain. Rats also can spread diseases, such as the plague. But rats can be useful, too. Medical researchers use them in experiments. Some people keep rats as pets.

Rattlesnake

Rattlesnakes are poisonous snakes that have rattles in their tails. A rattlesnake shakes its rattle to threaten, or warn off, other animals.

There are about 30 species, or types, of rattlesnake. They live in the Americas, from southern Canada to Argentina. They are most common in the deserts of the southwestern United States and northern Mexico.

A western diamondback rattlesnake shakes its rattle.

Most rattlesnakes are gray, tan, or brown with diamond-shaped patches or crossing diagonal bands. They are usually between 1 foot (0.3 meter) and 8 feet (2.5 meters) long. The head is shaped like a triangle.

Rattlesnakes belong to a group of snakes called pit vipers. Between each eye and nostril, a rattlesnake has a heat-sensing organ called a pit. It uses these pits to find prey. Rattlesnakes eat rodents, lizards, and birds. When a rattlesnake bites, venom, or poison, flows through its fangs into the prey.

When threatened, a rattlesnake raises and shakes its tail rattle. The rattle is made up of several hollow, loosely connected segments. It makes a buzzing sound when the segments rapidly hit each other. The sound warns intruders to back off.

Most rattlesnakes are shy and try to stay away from people. But if disturbed, a rattlesnake will bite a person. Rattlesnake bites are painful and can be life-threatening. But prompt medical treatment can usually stop the effects of the venom.

of noises, such as caws, croaks, and gurgles. People in some cultures think of these dark birds as symbols of death and bad things to come. However, some people admire ravens for the birds' great intelligence.

Ravens and crows are in the same family as jays and magpies. There are several different species, or types, of raven. The common raven is found in parts of North America, Europe, Asia, and Africa. Other types of raven also live in those four continents as well as in Australia.

Ravens are very hardy birds. They are found in a variety of habitats, including forests, mountains, deserts, and frozen plains.

Ravens look a good deal like crows. However, ravens are heavier and have bigger bills. They can measure up to 26 inches (66 centimeters) in length. Ravens also have shaggier feathers than crows do, especially around the throat. Ravens' feathers are all or mostly black, often with a blue or purplish shimmer. Several types

have some white or brown markings. The common raven is all black.

Ravens eat a varied diet that includes mice, insects, grain, and the eggs of other birds. They also feed on dead animals and garbage.

Ray

A ray is a fish with a flattened body and large, winglike fins. Rays belong to the same large group of fishes as sharks. Both rays and sharks have skeletons made up of cartilage (elastic tissue) instead of bone. Rays are found in all oceans of the world.

There are more than 300 different species, or types, of ray. These can be divided into several groups: skates, electric rays, sawfishes, and stingrays.

Rays vary in size. The little, or hedgehog, skate is less than 20 inches (50 cen-

timeters) long. The Atlantic manta, or giant devil ray, has a wingspan of up to 23 feet (7 meters).

Most rays have rough skin. It may be a solid color or patterned. Electric rays, however, have smooth skin. They also have electric organs near the head. These give powerful electric shocks to enemies or prey. A ray's tail is slender and sometimes long and whiplike. Stingrays have a poisonous spine on the tail. They use it for defense. Sawfishes have a long snout shaped like a saw. They use it mainly for hunting.

Rays often lie partly buried in sand or mud on the ocean floor. They feed on small fish and such crustaceans as crabs and shrimp. When prey gets close, rays quickly lunge out of the sand and snatch it up.

The females of most species give birth to live young. However, skates lay eggs.

Re

In ancient Egyptian mythology Re was the chief sun god. (His name is sometimes spelled Ra.) The sun god was very important to the Egyptians. The ancient pharaohs (kings) said they were related to him.

According to legend, Re created the universe. Time began when his sun disk rose out of the darkness for the first time. At creation, Re made Shu (air)

Re was the sun god of ancient Egypt.

and Tefnut (moisture). They gave birth to the sky goddess Nut and the Earth god Geb. From the marriage of Nut and Geb came the gods Osiris, Isis,

Seth, and Nephthys. These gods were the main figures of Egyptian mythology.

The Egyptians believed that at sunrise Re—the sun—began a journey across the sky in his boat. At sunset Re sailed his boat to the underworld. There each night he fought an evil snake named Apopis. Apopis tried to prevent the sun from rising again. But each night Re won. Each morning he began another journey across the sky, and the sun rose again.

Reagan, Ronald

Ronald Reagan was elected in 1980 as the 40th president of the United States. Reagan was a conservative who cut some kinds of government spending but strengthened the military. He strongly opposed the Soviet Union and other Communist countries.

Early Life and Career

Ronald Wilson Reagan was born in Tampico, Illinois, on February 6, 1911. His parents were Jack Reagan, a shoe salesman, and Nelle Wilson. At high school in Dixon, Illinois, Reagan played football and acted in school plays.

After graduating in 1932 from Eureka College, Reagan became a radio sports announcer in Iowa. In 1937 he moved to southern California, where he became a successful movie actor. His first film,

Did You Know?

Reagan's good speaking skills earned him the title The Great Communicator.

Ronald Reagan was the 40th president of the United States.

Love Is on the Air, was released in 1937. Reagan went on to appear in more than 50 movies and several popular television shows.

During World War II Reagan joined the Army Air Corps but did not see combat. In 1940 he married the actress Jane Wyman. They had a daughter and

adopted a son before getting a divorce in 1948. Reagan married the actress Nancy Davis in 1952. They had a daughter and a son.

Political Career

Reagan was a Democrat during the 1940s. After growing more conservative, he switched to the Republican Party in 1962.

Reagan was elected governor of California in 1966 and in 1970. In 1980 he ran for president with George Bush as his running mate. Reagan defeated President Jimmy Carter that year. He took office in January 1981. Reagan ran for reelection in 1984. He easily defeated his opponent, Walter F. Mondale.

Presidency

Reagan worked to reduce the role of the federal government. Congress approved many of his proposals to cut spending, except for defense, and to lower taxes.

TIMELINE

Reagan is born in Tampico, Illinois.

February 6, 1911

Reagan is elected president.

1980

The Iran-contra affair becomes public.

1986

Reagan dies in Los Angeles, California.

June 5, 2004

Reagan is elected governor of California.

Reagan survives an assassination attempt.

Reagan retires; George Bush becomes president.

1966

1981

1989

On March 30, 1981, a man shot Reagan in the chest in Washington, D.C. Reagan recovered after surgery.

In foreign affairs, Reagan built up the military to protect the country from the Soviet Union. He also proposed a system that would destroy missiles in space. He called the system the Strategic Defense Initiative. Reagan later improved relations with the Soviets. His historic meetings with Soviet leader Mikhail Gorbachev led both countries to destroy some nuclear weapons.

In 1986 the public discovered that officials who worked for Reagan had illegally sold weapons to Iran. The officials hoped that Iran would help to free U.S. hostages in Lebanon. They had then secretly sent money from the weapons sales to anti-Communist rebels (*contras*) in Nicaragua. The Iran-*contra* affair embarrassed Reagan, but he soon regained his popularity.

Later Years

Reagan retired in 1989. In 1994 he announced that he had Alzheimer's disease. Reagan died on June 5, 2004, in Los Angeles, California.

Reconstruction

After the American Civil War ended in April 1865 the United States went through a period known as Reconstruc-

An illustration shows African American men lining up to vote for the first time. Men who had been slaves gained the right to vote during Reconstruction.

tion. The Union (the Northern states) had defeated the Confederacy (the Southern states that had left the Union). From 1865 to 1877 the two sides worked to put the United States back together.

During Reconstruction, people disagreed on how to readmit the Southern states, or bring them back to the Union. They also disagreed on what to do about African Americans who had won freedom from slavery.

Radical Reconstruction

While the war was still going on, President Abraham Lincoln made a plan to readmit Confederate states quickly. Lincoln was killed in April 1865. Andrew Johnson then became president. He wanted to carry out Lincoln's plan.

Some members of the U.S. Congress, called Radical Republicans, disagreed with Lincoln and Johnson. They wanted to punish the South. They also wanted to protect African Americans. In 1867 the Radical Republicans took control of Congress. The period that followed is called Radical Reconstruction.

During Radical Reconstruction, lawmakers put the South under military rule and removed most white Southern leaders from power. This left control of the Southern states in the hands of African Americans and whites loyal to the Union. Some of these whites were criticized by Southerners, who called them carpetbaggers. The term referred to the idea that they were Northerners who came to the South carrying only what

they could put in a small bag. Southerners also accused them of coming to take advantage of the situation. Some white Southerners cooperated with the blacks and carpetbaggers. Other Southerners accused those who cooperated of doing so in order to further their own interests. They called them scalawags.

Congress also required Southern states to ratify (approve) the 14th Amendment to the Constitution before they could rejoin the Union. This amendment guaranteed citizenship to African Americans. By 1870, all 11 former Confederate states had approved the amendment and rejoined the Union.

Freed African Americans

Meanwhile, nearly 4 million former slaves tried to start new lives in the South. A government agency called the Freedmen's Bureau helped them. It provided medical care and food. It also built more than 1,000 schools.

In 1870 the 15th Amendment to the Constitution guaranteed African Americans the right to vote. These new voters helped to elect African Americans to many offices, including seats in Congress.

Despite these gains, most African Americans in the South were still poor. They had no way to buy land and ended up working on farms for low pay.

Reconstruction Ends

Reconstruction gradually came to an end for several reasons. Some radical leaders died. People accused some

A cartoon from the 1870s makes fun of a Northern politician. It shows him as a carpetbagger, or a Northerner who moved to the South with only what he could carry in a small bag. (At the time, traveling bags were commonly made of carpet.)

Reconstruction governments of dishonesty. New terrorist groups like the Ku Klux Klan stopped African Americans from voting or running for office. As a result, Southern Democrats (who had supported the Confederacy) took back control of governments in the South.

The final blow came with the presidential election of 1876. The vote was so close that both Republicans and Democrats claimed victory. The Democrats allowed the Republican winner, Rutherford B. Hayes, to become president only after making a deal. Hayes promised to remove U.S. Army troops from the South. The troops left in 1877. Southern Democrats were then in complete control of the South. Reconstruction was over.

Recycling

Recycling is a way to reduce the amount of garbage that is thrown away. Every year the United States produces millions of tons of garbage. The garbage is sent to landfills, where some of it pollutes the land and air. As a result of recycling, some things that would have been thrown away are reused instead in new products.

What Gets Recycled

Many items can be recycled, including aluminum cans, glass bottles, newspa-

Recycling starts when recyclable materials are sorted and left to be picked up.

pers, magazines, and plastics. Composting is also a form of recycling. It involves saving certain food wastes and mixing them with grass clippings and leaves. This creates a nutrient-rich mixture that can be used in gardens. Even water can be recycled. Before water is reused, it is cleaned and purified at a wastewater treatment plant.

Types of Recycling

There are two types of recycling: internal and external. In internal recycling, the waste products from manufacturing processes are reused within the same factory. For example, when copper tubing is being made, the ends of the tubes are usually trimmed. These copper ends are melted down and used to make new tubing.

In external recycling, people collect recyclable materials. The recyclables are brought to a recycling facility, where they are sorted, cleaned, and prepared to be sold. Industries then buy the material and use it to make new products.

Importance of Recycling

Governments and groups that try to protect the environment have encouraged people to recycle. They say that recycling is important in several ways. It reduces pollution of air, water, and land. It also protects natural resources such as trees, minerals, and oil. These do not get used up as quickly if people can reuse existing products made from these resources.

Red Cross and Red Crescent

The International Movement of the Red Cross and Red Crescent is a collection of groups that help people during times of war and natural disasters. The groups are not religious. However, the Red Cross is the name used in mainly Christian countries. The Red Crescent is the name used in mainly Muslim countries. (A cross is a symbol of Christianity and a crescent is a symbol of Islam.)

More than 180 Red Cross and Red Crescent societies, or groups, exist throughout the world. For example, there are an American Red Cross, a British Red Cross, and a Pakistan Red Crescent. Each society is independent and offers its own services. The societies provide medical help, food and water, and shelter to victims of earthquakes, floods, and other natural disasters. They also

Red Cross workers in South Korea prepare aid kits to be sent to North Korea. North Koreans needed help after a train accident injured many people.

help people during times of war. During peacetime, the societies teach first aid and safety skills. Many also run blood banks.

The International Committee of the Red Cross (ICRC) was the first Red Cross group. It is based in Switzerland. The ICRC helps people affected by wars or other violent conflicts. Because it never takes sides in wars, most countries trust this group. Countries often allow the ICRC to work in areas where other groups are not allowed.

A Swiss man named Jean-Henri Dunant started the Red Cross movement. In 1863 he helped to form an international group of people to help wounded soldiers. These helpers began using a red cross as their symbol. The group became known as the ICRC in 1875. In 1901

Red Sea

The Red Sea separates the Arabian Peninsula from northeastern Africa. It was named for the changing color of its water. Normally the water is blue-green. Sometimes, though, red algae turn the water reddish brown.

The Red Sea is long and narrow. On the east it is bordered by the Arabian countries of Saudi Arabia and Yemen. The African countries of Egypt, Sudan, and Eritrea lie to the west. In the south a passageway called a strait connects the Red Sea with the Gulf of Aden and then with the Arabian Sea. In the north the Suez Canal connects the Red Sea to the Mediterranean Sea.

The Red Sea is one of the world's busiest trade routes. Ships carry passengers and goods between Europe and Asia through the Suez Canal. The

Redwood

The redwood is the world's tallest type of tree. One tree was measured at 367.8 feet (112.1 meters) tall. Many redwoods grow to heights of more than 300 feet (90 meters).

The redwood grows in Oregon and California. It is found in foggy areas near the Pacific coast. A related tree is the dawn redwood. It grows in central China. Two other trees are sometimes called redwoods: the giant sequoia of

California and the Japanese cedar of eastern Asia.

The redwood has a huge trunk. It can be 10 to 20 feet (3 to 6 meters) across. The trunk may have no branches for the first 100 feet (30 meters). This is because the redwood sheds its lower limbs as it grows. The leaves on the lower branches are dark green and pointed. Short needles grow near the tree's top. The redwood has small cones. They are only about 1 inch (2.5 centimeters) long.

A redwood may live for more than 1,500 years. Its long life is partly due to the tree's thick bark. Redwood bark can be more than 12 inches (30 centimeters) thick. It helps the tree to resist disease and parasites, or harmful animals. The bark also resists fire.

Redwood timber is used to make furniture, shingles, and fence posts. Several state parks have been created to protect

Reformation

A religious movement known as the Reformation swept through Europe in the 1500s. Its leaders disagreed with the Roman Catholic church on certain religious issues and criticized the church's great power and wealth. They broke away from the Catholic church and founded various Protestant churches. Today, Protestantism is one of the three major branches of Christianity. As the Reformation spread across Europe, it also inspired movements for political and social change.

Origins and Spread

In the early 1500s almost everyone in western and central Europe was Roman Catholic, and the church was very powerful. The Reformation began in 1517. In that year a German priest named Martin Luther circulated a list of doubts he had about certain Catholic beliefs and practices. Soon after, Luther came to reject the authority of the church and its leader, the pope. He thought that people could learn all religious truths directly from the Bible. Luther also believed that people are saved by their faith alone, not by works they do. He called for the end of most of the sacraments, or rituals, of Catholicism.

An illustration shows Martin Luther (right) meeting with Roman Catholic leaders. Luther was a major figure in the Reformation.

The pope condemned Luther's teachings. But Luther's message spread quickly. Huldrych Zwingli called for even greater changes in Christian worship. He converted many people in Switzerland to Protestantism. John Calvin helped bring the Reformation to France and made Geneva (now in Switzerland) into a Protestant city-state. In 1534 King Henry VIII established the Church of England, with himself as leader. Influenced by Calvin, John Knox helped found the Presbyterian church in Scotland. By the mid-1600s Europe was mostly divided into Protestant and Catholic regions. Most of these divisions have remained in place. In the 1600s the settlers of the British colonies brought Protestantism to North America.

Counter-Reformation

The Roman Catholic church tried to stop the spread of Protestantism with its own movement, the Counter-

Reformation. Members of a religious order known as the Jesuits spread Catholicism through their teaching and missionary work. A Catholic court system called the Inquisition punished Catholics who disobeyed church teachings. From 1545 to 1563 a Catholic body known as the Council of Trent made many changes to the Catholic church in an attempt to correct its problems. The Counter-Reformation won back many people who had left the Catholic church.

Refugee

When people leave their country to seek refuge, or protection, in another country, they are called refugees. Sometimes governments force people to leave their country. Other people leave their coun-

A refugee camp in Kyrgyzstan houses people who escaped violence in their home country of Uzbekistan. Many refugees must live in temporary homes, such as tents.

try because they belong to a group that is being mistreated. Still others leave their country to escape wartime conditions or starvation.

Even though they seek shelter in a new country, refugees often continue to think of the old country as their home. They may want to move back if conditions change. This makes refugees different from other migrants, who want to change their homes permanently. Refugees are also different from displaced persons. These are people who are forced from their homes but not out of their country.

Refugees Before the 1900s

Before the 1900s, many refugees were people who disagreed with their country's religion. In the 1400s a Roman Catholic court called the Inquisition forced the Jews out of Spain. Beginning in 1685, French Catholics expelled French Protestants called Huguenots from France.

These refugees often moved to new countries with few problems. There were not many rules about movement from one country to another. This situation changed when modern nations developed in the 1800s. Refugees from modern nations needed to ask permission to enter another country. The new country then decided whether to offer asylum, or protection, to the refugees. (Asylum prevents refugees from being handed back to the country that mistreated them.)

Refugees in the Early 1900s

The battles of World War I (1914–18) forced many refugees from Belgium, France, Italy, and Romania. These refugees resettled in their homelands after the war. However, the Russian Revolution of 1917 forced more than 1.5 million out of Russia permanently. Meanwhile, Turkey forced more than 1 million Armenians to move to Syria and Palestine between 1915 and 1923.

The new international organization called the League of Nations decided to deal with the growing problem of refugees. It appointed a Norwegian explorer named Fridtjof Nansen to help refugees. Nansen created a League of Nations Passport to allow refugees to move freely across national boundaries. He won the Nobel peace prize (an important international award) in 1922 for his work.

World War II and Its Aftermath

World War II (1939–45) created more than 60 million refugees. Jews fleeing the Nazi leaders of Germany made up a large portion of them. Many entered the United States, and others moved to South America and other places. Hundreds of thousands of people left Poland for the Soviet Union. In Asia, Japanese attacks forced more than 30 million Chinese people from their homes.

In Europe, many events that followed the war created still more refugees. Millions of Germans had to move out of a region called East Prussia when it became a part of Poland. In addition,

Did You Know?

One goal of the organization called Amnesty International is to help refugees find asylum.

World War II refugees cross a wrecked bridge in Germany in 1945.

the Soviet Union began setting up Communist governments in eastern European countries. People left those countries because they were afraid of losing their freedom.

The United Nations (UN) replaced the League of Nations in 1945. In 1950 the UN created an office to help refugees. The office, called the Office of the High Commissioner for Refugees, won the Nobel peace prize in 1954 and 1981.

Refugees Since World War II

The two world wars were not the only events that created many refugees. In 1947 the British divided their colony of India into two new independent countries: India, where the main religion was Hinduism; and Pakistan, where the religion was Islam. Eighteen million people crossed the borders in order to live with others of their own religion.

During the 1900s, many Jewish migrants and refugees settled in the

Middle East in the region called Palestine. They created Israel as a Jewish homeland in 1948. After that, many Arabs who had been living in Palestine became refugees themselves.

Millions of refugees fled Asian wars. One such war was the Korean War of 1950–53. Another was the Vietnam War that ended in 1975. Another was the invasion of Afghanistan by the Soviet Union in the 1980s. More than 1 million refugees left Iraq during the Persian Gulf War in 1991.

Events in Africa, the Americas, and Europe also created refugees. Civil wars in Africa forced millions from their homelands. When the Caribbean nation of Cuba became Communist in 1959, more than 1 million refugees left the island. The breakup of Yugoslavia in the 1990s set off fighting between its different groups of peoples. Two million people had to leave their homelands.

In the early 21st century, the UN estimated that there were still about 10 mil-

Reindeer

Reindeer are mammals of the deer family along with moose and elk. They are also called caribou. All reindeer grow pairs of antlers, which are large bony growths on the head. Female reindeer are the only females of the deer family to grow antlers.

Reindeer live in the far northern regions of North America, Europe, and Asia. They live in forests and the Arctic tundra, or treeless plains of the far north.

Compared to other members of the deer family, reindeer have thicker bodies and shorter legs. Reindeer stand about 2 to 5 feet (0.6 to 1.5 meters) high at the shoulder. They can weigh as much

as 700 pounds (320 kilograms). They have thick coats of brown, gray, or whitish fur. Their feet have wide hooves.

Reindeer live together in herds. The herds travel long distances between their summer and winter homes. Reindeer eat grasses, other plants, and a plantlike material called reindeer moss.

Reindeer breed in autumn. The males often battle each other for mates. The females usually give birth to one baby at a time.

Some people, including the Sami of northern Europe, keep herds of reindeer. They use the animals to pull sleds over the snow. They also raise reindeer for their meat, milk, and skins.

Religion

People often use the word religion to mean the worship of a god or gods. But some religions do not have gods. One thing that all religions have in common is that they help their followers to find meaning in the world. Many people want to know where the world came from. Many also want to know what happens after death. Most religions offer some sort of answer to these great questions. The major world religions of today are Christianity, Islam, Hinduism, Buddhism, Sikhism, and Judaism.

Some reindeer are found in the Arctic tundra, while others are forest animals.

Major World Religions	
Religion	Number of Followers in the World, Mid-2005
Christianity	2,133,806,000
Islam	1,308,941,000
Hinduism	860,133,000
Buddhism	378,808,000
Sikhism	25,377,700
Judaism	15,073,000
Source: Britannica Book of the Year, 2006	

Nearly three quarters of the people on Earth follow one of six major world religions.

Types of Religion

Throughout history there have been two main types of religion. One type has a single, all-powerful god. Judaism, Christianity, and Islam are the major religions that say there is one god. Other religions with one god include Sikhism and Baha’i.

In the other main type of religion, followers believe in more than one god. The religions of this type include Hinduism, Jainism, Shinto, Zoroastrianism, Native American religions, and traditional African religions.

Followers of other religions do not focus on worshipping gods. For example, followers of Buddhism search for a higher state of being, which means freedom from suffering. Followers of Daoism focus on acting in a certain way.

Common Elements of Religion

Religions usually have rituals, or special patterns of actions, that followers perform. They often have prayers that followers say and holidays on certain days of the year. Many religions have written

works that are considered holy, such as the Bible or the Koran. Many religions also have special buildings, such as churches or temples, where followers gather for worship.

Religions set out rules or guidelines for how followers should live. Different religions have different rules. However, many religious rules have to do with treating others well and doing the right thing. Religions also have sets of beliefs that followers accept as true—for example, belief in a god and life after death.

Religions have played a very important role in the history of people all over the world. They have affected almost every part of people’s lives. For example, religions have affected the way governments are set up, how families are formed, and the way people teach their children.

Rembrandt

The Dutch painter Rembrandt is one of the most famous of all European artists. He created many historical and biblical paintings known for their rich color and masterful use of light and shadow. He is also known for his drawings and etchings (a type of print).

Rembrandt was born on July 15, 1606, in Leiden, the Netherlands. His full

Did You Know?

Religions that focus on the belief in one god are called monotheistic.

Rembrandt painted his own portrait at age 63.

name was Rembrandt Harmenszoon van Rijn, but he is usually known simply by his first name. He attended the University of Leiden but left to study painting. By the time he moved to Amsterdam in 1631, he was already a successful painter. Many wealthy people hired him to paint their portraits. An early masterpiece of his was *The Anatomy Lesson of Dr. Nicolaes Tulp*, a group portrait painted in 1632. He completed another famous group portrait, *The Night Watch*, in 1642.

Around that time Rembrandt's work began to go somewhat out of fashion. With fewer orders for portraits, he began to have money problems. In the late 1650s he sold his house and many of his belongings to pay his debts. But he continued his work, producing portraits of biblical figures, local people,

and himself. Rembrandt died on October 4, 1669, in Amsterdam.

Painting

Renaissance

The Renaissance was a period in European history. It began in the 1300s, during the late Middle Ages. It ended during the 1500s, when the modern era began. Renaissance means “rebirth” in French. During the Renaissance there was a rebirth of interest in ancient Greece and Rome. The Europeans of the Renaissance took ideas from the ancient people and developed their own. They also made scientific discoveries and created great art.

Background

During the Middle Ages there were two institutions that controlled much of Europe. The Holy Roman Empire influenced the political life of the people. The popes of the Roman Catholic church controlled the religious life. Both of these institutions began to lose power by the 1300s. Individual European nations also grew stronger. People started writing in their own languages instead of Latin (the language of the Catholic church). People felt freer to think in new ways.

Humanism

Before the Renaissance, most people in Europe placed great importance on God and religion. During the Renaissance, some people began to think about the

importance of humans as well. For this reason these thinkers were called humanists. Humanists wanted to make the most of their lives on Earth. They also wanted to understand the world around them.

One of the first humanists was Francesco Petrarch, an Italian poet who died in 1374. Petrarch was interested in what ancient writers had to say about humanity. He got many other people, including the great storyteller Giovanni Boccaccio, to share his interests.

The Printing Press

In about 1450 a German named Johannes Gutenberg invented the printing press. This allowed people to make many copies of written works. Printed books soon spread the ideas of the Renaissance all over Europe.

A map of the Western Hemisphere from the 1500s shows that people during the Renaissance were still discovering how the world looked.

An illustration shows Andreas Vesalius, a doctor during the Renaissance. Vesalius cut open dead bodies to learn how the human body works.

One of the first thinkers to have his writings printed was Desiderius Erasmus of Rotterdam (now in The Netherlands). Erasmus was a humanist scholar.

Science

The spirit of inquiry and discovery also led to a Renaissance in science. In the Middle Ages, scholars usually took their scientific knowledge from books. During the Renaissance, however, people began to experiment and observe for themselves.

Nicolaus Copernicus, who was born in Poland, was one of the greatest astronomers of the Renaissance. He showed that Earth revolves around the sun. For more than 1,000 years before that people had

believed that everything in the universe revolved around Earth.

Andreas Vesalius was a medical doctor from Brussels (now in Belgium). Vesalius found out about the human body by carefully dissecting, or cutting apart, dead bodies.

Art

A painting from the early 1500s shows the realistic style of art that was popular during the Renaissance. It also shows the type of dress worn by wealthy ladies in Italy.

Some of the greatest Renaissance artists worked in Florence and in other cities in Italy. The rulers of Florence, the Medici family, spent great amounts of money to have artists create pictures, buildings, and statues.

Leonardo da Vinci worked during the late 1400s and early 1500s. He painted two of the world's most famous works: the *Mona Lisa* and the *Last Supper*.

Leonardo also made statues and designed weapons. He even drew up plans for a helicopter.

Michelangelo and Raphael were also important artists of this period. They painted religious figures but gave them a realistic, human quality.

Exploration

The Renaissance also led people in Europe to explore parts of the world they had never seen. Christopher Columbus and others from Spain and Portugal discovered two continents—North and South America—that had been unknown to Europeans. This led to other voyages of discovery.

Late Renaissance

No one event marks the end of the Renaissance. The spirit of discovery that defined the period led people to try new ideas in all areas of life. Slowly artists turned to new styles. New ways of thinking about other fields, such as government and politics, also developed.

Reproductive System

All living things reproduce, or create offspring. Animals' offspring are often called babies. The body parts that allow animals to create babies belong to the reproductive system.

Types of Reproduction

Some animals can create offspring through asexual reproduction. This means that one animal creates offspring on its own. For example, corals, hydras, and sea anemones can reproduce through a process called budding. In budding, a growth called a bud breaks off from the animal to make a new animal. A few animals, including some worms, can break in half to create two separate animals.

Most animals use sexual reproduction to have babies. This means that two sex cells, one from a male and one from a female, join together to create a baby. In some animals, including many types of fish, the male and female sex cells join together in water, outside the female's body. In other animals the sex cells join together inside the female's body.

After the sex cells join they grow into a baby. The babies of some animals, such as birds and many reptiles, develop in eggs outside the female's body. The babies of most mammals develop inside the female's body.

Human Reproduction

Like other mammals, humans reproduce sexually. A woman's body supports a baby as it grows. For these reasons men and women have different reproductive organs.

Male Reproductive System

In men the main reproductive organs are the testes. The two oval-shaped

Female Reproductive System

Male Reproductive System

Men and women have different reproductive organs. A woman's ovaries produce egg cells. A man's testes produce sperm.

Journey of an Egg

One of a woman's ovaries releases an egg each month. If the egg meets a sperm cell, it may become fertilized. The fertilized egg travels to the uterus, where it grows into a baby.

testes sit behind the penis in a pouch called the scrotum. The testes make the male sex cells, called sperm. Sperm are too tiny to see without a microscope. They are shaped like tadpoles with long tails. The tail of a sperm is what moves it forward.

The sperm travel through a tube toward the penis. They mix with other fluids to form a liquid called semen. During sexual intercourse a small amount of semen passes through the tip of the penis into the woman's body. This semen contains between 200 and 300 million sperm. The sperm then travel toward the woman's sex cell, or egg.

Female Reproductive System

In women the main reproductive organs are the ovaries. The two almond-shaped ovaries sit inside the lower belly. When a girl is born her ovaries contain up to 500,000 egg cells. Two tubes, called fallopian tubes, connect the ovaries to the uterus. The uterus is a muscular organ that holds a growing baby.

Beginning when a girl is about 12 years old, one ovary releases an egg once a month. This process is called ovulation. The egg travels from the ovary through the fallopian tube to the uterus. If the egg does not meet a sperm cell on its journey, it dies. The egg and some blood

then pass out of the uterus and through the vagina, a muscular tube that leads out of the body.

Fertilization, Pregnancy, and Birth

Sperm enter the woman's body through the vagina. The sperm swim up through the uterus and into the fallopian tubes. If an egg is in one of the fallopian tubes, the sperm try to join with it. Only one sperm can enter, or fertilize, the egg. The rest of the sperm die.

Once the egg is fertilized, pregnancy (or gestation) begins. The fertilized egg moves into the uterus. As it travels it

starts to divide into many more cells. After about five or six days these cells burrow into the wall of the uterus. There the cells begin to develop into a baby. At first the developing baby is called an embryo. After about eight weeks the baby is called a fetus.

In the uterus the baby grows inside a pouch called the amniotic sac. The amniotic sac is filled with clear liquid. The liquid protects the baby and lets it move around. A bundle of blood vessels, called the umbilical cord, connects the baby's belly to the placenta. The placenta is a structure

A human pregnancy lasts about nine months. A developing baby goes through many changes during the first three months.

From the fourth month to the ninth month of pregnancy, the developing baby grows much larger. The mother's uterus and belly greatly expand.

that lines part of the uterus. The placenta brings nourishment from the mother's body to the baby. It also takes away wastes from the baby.

After about nine months of development the baby is ready to leave the woman's body. The bottom end of the uterus, called the cervix, expands to create a wide opening into the vagina. The muscles of the uterus contract, or tighten, to push the baby downward. The baby moves slowly through the vagina and out of the mother's body.

When the baby is born the umbilical cord and the placenta also leave the mother's body. The newborn baby is cut free from the cord and the placenta. After several days the stump of the cord dries up and falls off the baby's belly. It

leaves behind an indentation called a navel, or belly button.

Reptile

A reptile is an air-breathing animal that has scales instead of hair or feathers. Reptiles have lived on Earth for more than 280 million years. Scientists consider them to be the ancestors of birds and mammals.

Over the years many kinds of reptiles have become extinct, or died out. The dinosaurs are well-known reptiles that became extinct about 65 million years ago. Today there are about 6,000 species, or types, of living reptile. They

include snakes, lizards, turtles, alligators, and crocodiles.

Where Reptiles Live

Reptiles are found all over the world, except in very cold areas. The greatest number and variety are in the hot, humid tropics. Snakes and lizards live in many different kinds of places. They can live on land, in trees, in underground tunnels, or in water. Most turtles live in water but spend some time on land. Tortoises live only on land. Alligators and crocodiles spend most of their time in water, but they can make short trips on land.

Physical Features

Reptiles are vertebrates, or animals with a backbone. Except for snakes, most reptiles have four limbs. Reptiles vary greatly in size. Some snakes and lizards are less than 2 inches (5 centimeters) long. The largest crocodiles, pythons, and anacondas can grow to more than 30 feet (9 meters) long. The largest lizard is the Komodo dragon, which reaches a length of more than 10 feet (3

The flashy pattern of an adder's scales may warn predators to stay away. Adders are venomous, or poisonous, snakes.

meters). Leatherback turtles grow to more than 7 feet (2 meters) long.

Reptiles have dry skin that is covered with scales. Scales are hardened folds of the upper layer of skin. The scales of many lizards overlap. They are arranged side by side in snakes and alligators and crocodiles. Scales also cover the bony shells of turtles.

Reptiles shed and replace their scales throughout their lifetime. Some species shed often. Others shed several times a year. Snakes shed all their scales at once. Lizards, turtles, alligators, and crocodiles shed their scales one by one or in patches.

Behavior

Reptiles are cold-blooded animals. This means that their body temperature changes when the temperature around them changes. Reptiles warm or cool themselves by moving to warmer or cooler places. Most reptiles are inactive during winter. This is called hibernation.

Crocodiles lie on grass in Madagascar, a tropical island in the Indian Ocean.

Some are inactive during parts of the summer. This is known as estivation.

Most reptiles are meat eaters. They eat many kinds of animals, including insects, birds, frogs, mice, and fish. Some reptiles follow their prey. Others hide and wait for the prey to approach. Certain snakes shoot venom, or poison, into their prey. A few lizards and turtles eat only plants.

Reptiles have different ways of protecting themselves from their enemies. Rattlesnakes shake their tail rattle when they feel threatened. A cobra spreads its neck to look bigger. Some turtles hide in their shells. Crocodiles, turtles, and some lizards and snakes hiss loudly. Most reptiles bite when threatened.

Senses

Alligators, crocodiles, and most lizards hear fairly well. Snakes and turtles have trouble hearing. Instead they can feel vibrations in the ground. Some reptiles have poor eyesight. This is true of snakes and lizards that tunnel underground.

Reptiles taste and smell using special organs in the mouth or nose. Some snakes also have organs that are sensitive to heat. These organs can sense prey even in total darkness. This is because the bodies of mammals and birds give off heat.

Movement

Reptiles use various methods to move from place to place. Most lizards walk on four limbs. Some use only their hind limbs when running. Certain snakes and

legless lizards move by pushing their belly scales against rough surfaces and pulling the body forward. Some desert snakes use a type of movement called sidewinding. They repeatedly bend and lift the body to move across the sand.

Flippers or webbed feet help sea turtles swim. Sea snakes use their flattened tails like paddles in the water. Alligators and crocodiles swim by whipping their tails from side to side.

No living reptile can fly. However, some tropical snakes and lizards can glide from tall trees by flattening their bodies.

Life Cycle

Most reptiles lay eggs. Some lay just one egg. Others can lay up to 200. It usually takes about 60 to 105 days for the eggs to hatch. Certain snakes and lizards give birth to live young.

Most reptiles take at least a year to mature. Unlike mammals, reptiles may grow throughout their lives. Some reptiles live longer than any other vertebrates. Many species of reptile can live

Did You Know?

Some snakes and the stink-pot turtle let out foul odors to chase away enemies.

Flying lizards cannot really fly. But they can glide down easily from high places.

An eastern box turtle gets its first look at the world after hatching from a leathery egg. It is on its own and will get no care from its parents.

for more than 20 years in zoos. Certain turtles have lived for more than 100 years.

Republic

A republic is a form of government in which the people elect, or choose, their leaders. In most countries with a republican government, the people elect the head of the government, such as a president. They also elect other people, called representatives, to make laws.

The leaders of a republic are responsible to the people who elected them. If the people do not like the way their leaders govern, they can vote them out of office. This means that the people are the source of power. This sets republics apart from countries led by a king or another all-powerful ruler.

Republics Today

Today most countries are true republics, meaning that the people choose their leaders. These republics practice a form of democracy. A democracy is any government in which the people have a say. The United States, Mexico, India, France, Kenya, South Korea, Peru, and Indonesia are only a few of the world's many true republics.

Some countries call themselves republics simply because a monarch (a king or a queen) is not the leader. They are not always democracies. For example, China calls itself a people's republic. But the Chinese people have no choice in who their leaders are.

Other countries practice democracy but are not really republics, either. In the United Kingdom the people vote for representatives in Parliament (the country's lawmaking body). But they also have a monarch. However, the monarch has little real power.

The president of Finland, Tarja Halonen, ran for reelection in 2006. In a republic, people elect their leaders.

History

The first republic was in ancient Rome. In 509 BC the Romans set up a republic that lasted for almost 500 years. A group of elected leaders called the Senate was the highest power in the government.

The next important democratic republics formed in the late 1700s. In 1788 the United States set up the first modern republic. An elected president leads the U.S. government. Groups of elected leaders called senators and representatives make the laws.

Respiratory System

All animals need a steady supply of oxygen in order to live. Oxygen is a gas found in air. It helps to turn food into energy. This process creates another gas—carbon dioxide. Carbon dioxide

Fish have gills instead of lungs. A fish takes in oxygen as water flows past its gills.

grasshopper respiratory system

Insects have no lungs. They use holes called spiracles and air sacs to breathe.

must be removed from the body. The respiratory system is the body's way of breathing in oxygen and breathing out carbon dioxide.

Insects breathe through holes in the sides of their bodies. Fish and young amphibians have organs called gills to take in oxygen from water. Mammals, birds, reptiles, and adult amphibians breathe through lungs.

The Human Respiratory System

The human respiratory system includes several parts: nasal cavity, throat, voice box, windpipe, bronchi, and lungs. Air enters this system through the nose. It then moves into the nasal cavity, a hollow space behind the nose. Air also enters through the mouth. These two airways meet at the upper part of the throat, called the pharynx.

From the pharynx, two passageways open downward. One is for food, and the other is for air. The passage for air contains the voice box, or larynx. Below the voice box is the windpipe, or trachea.

The trachea separates into two main branches, or bronchi—one for each lung. Within the lungs, the bronchi divide into smaller and smaller branches. The branches end with tiny air sacs called alveoli. There are more than 600 million alveoli in the lungs. The alveoli contain tiny blood vessels called capillaries.

The Breathing Cycle

The brain controls breathing. It controls the diaphragm, a muscle at the base of the lungs. It also controls the muscles between the ribs.

When the diaphragm moves down and the ribs move out, the area inside the chest grows larger. Air then flows into the lungs and makes them expand. Blood in the capillaries picks up oxygen from the air in the alveoli. The blood then brings the oxygen through the cardiovascular system to all parts of the body.

As the blood picks up oxygen, it also brings carbon dioxide from the body to the alveoli. The rib muscles and the diaphragm then relax. As the area inside the chest shrinks, the lungs decrease in size. The smaller size forces out air, including the carbon dioxide.

Newborn babies breathe up to 44 times a minute. Adults breathe only about 16

Tiny structures in the lungs called alveoli and capillaries exchange oxygen for carbon dioxide.

Diaphragm, ribs, and lungs all move when a person breathes in and out.

times per minute. When people are asleep, they breathe more slowly, about six to eight times per minute. If people are afraid or worried, they can breathe up to 100 times per minute.

Problems with the Respiratory System

Hiccups are a harmless problem with the respiratory system. They happen when the diaphragm moves in a fast, jerky way. Colds and influenza (the flu) are infections that start in the nose and the throat. Bronchitis is a swelling of the bronchi. Pneumonia is an infection of the lungs. Tuberculosis, emphysema, and lung cancer are serious diseases of the lungs.

Réunion

The island of Réunion is a department (a type of province) of France. It lies near Africa in the Indian Ocean. Réunion's capital is Saint-Denis.

Geography

Réunion is about 420 miles (680 kilometers) east of Madagascar, an island country to the southeast of Africa. Réunion has many mountains. Some of them are active volcanoes. The island has a warm climate with dry and rainy seasons. Tropical storms called cyclones are common.

Plants and Animals

Réunion has many flowering plants and tropical fruit trees. Tropical forests grow in the higher areas. Animals on the island include chameleons, frogs, birds, and butterflies.

People

Many of the people of Réunion have a mixture of African, European, and South Asian roots. Whites and South Asians form other large groups. There are small groups of Chinese and Africans.

French is the language of government, but Creole is the language of everyday

A green valley lies between mountains in Réunion.

life. Roman Catholicism is the main religion. Most people live in cities or towns.

Economy

Services, especially tourism, are the most important part of Réunion's economy. The island also produces sugar, rum, and lobsters. Farmers grow sugarcane, fruits, vegetables, vanilla beans, tobacco, and geraniums, which are used to make perfume. Réunion trades mainly with France.

History

Portuguese explorers discovered the island in the 1500s. No one lived there until the 1600s, when the French built a settlement. The French brought Africans to work as slaves on coffee and sugar plantations. After slavery ended in 1848, workers from Asia arrived.

Réunion was a French colony until 1946, when it became a department of France. The people of Réunion then became citizens of France.

Revere, Paul

Paul Revere was a hero of the American Revolution. He is most famous for riding his horse through the countryside near Boston to warn the colonists that the British were coming. Revere was also a skilled silversmith (maker of silverware).

A painting shows Paul Revere holding a silver teapot that was made in his own workshop.

Paul Revere was born on January 1, 1735, in Boston, Massachusetts. His father's family was French and the family name was changed from De Revoire to Revere. Paul learned silversmithing from his father.

As a young man Revere joined the Sons of Liberty, a club for colonists who disliked British rule. Such people were known as patriots. In 1773 he and other patriots protested a tax on tea by throwing British tea into Boston Harbor. This action became known as the Boston Tea Party.

On April 16, 1775, Revere rode to warn the patriots of Concord, Massachusetts, to hide their weapons from the British. Two days later he rode again, from Boston to Lexington, Massachusetts. This time he warned the patriots John Han-

cock and Samuel Adams that the British were coming to arrest them.

He also warned the Lexington minutemen that the British were coming. The minutemen were fighters who boasted that they needed only a minute to get ready. On April 19, the Lexington minutemen fought the battle that started the American Revolution.

During the war Revere set up a factory that made gunpowder for the military forces. He also served in the army, defending Boston Harbor. After the war, Revere returned to his work as a silversmith. He also manufactured copper sheeting. Paul Revere died on May 10, 1818, in Boston.

Reye's Syndrome

Reye's syndrome is a serious disease of children. Luckily it is not very common. But when doctors do not treat it right away, it can cause brain damage or even death. Some doctors believe that Reye's syndrome is brought on by a medicine called aspirin.

Reye's syndrome often strikes children who are getting over influenza, the common cold, or some other disease that is caused by a virus. The first symptom, or sign, of Reye's syndrome is frequent vomiting. Then the person might become tired and confused. Some people breathe rapidly and have violent muscle movements called convulsions. The person may finally fall into a coma, which is like a deep sleep from which someone cannot be awakened.

Doctors think that aspirin triggers Reye's syndrome. Some of a person's cells might have a problem that does not appear until the person takes aspirin. To prevent Reye's syndrome, doctors recommend that children under 12 do not take aspirin.

Reye's syndrome is a serious disease that requires a hospital stay. In the hospital, doctors give the person fluids and medicines to reduce brain swelling. The person also gets help with breathing. If the disease is treated early enough the person can usually make a full recovery.

Reykjavík

Population
(2008 estimate)
119,000

Reykjavík is the capital of Iceland, an island country in the North Atlantic Ocean. It is Iceland's largest city by far.

The name Reykjavík means “bay of smokes.” It refers to the steaming-hot water that spouts from the ground at nearby hot springs. Water piped from the hot springs is used to heat the city.

Reykjavík has many businesses and industries. The city is a fishing port. It has factories that process fish, other foods, and aluminum. However, most people work in service industries such as sales, banking, and health care.

According to legend a Viking founded Reykjavík in 874. It was a small fishing village until the 1900s.

Denmark began to rule Iceland in the late 1300s. In 1786 Reykjavík became the island's capital. Iceland's lawmakers have met in the city since 1845. In 1944 Iceland became an independent country with Reykjavík as its capital.

Rhinoceros

Rhinoceroses are heavy mammals with thick skin and hooves. There are five species, or types, of rhinoceros. Illegal hunting has left most of them in danger of dying out.

The Sumatran, the Javan, and the great Indian rhinoceroses are found in Asia. The black rhinoceros and the white, or square-lipped, rhinoceros are found in Africa.

Most rhinoceroses live by themselves. They generally live in grasslands or in marshes. The Sumatran rhinoceros prefers the forest.

Rhinoceroses weigh 3 to 5 tons. They are about 8 to 13 feet (2.5 to 4 meters) long. Some have one horn on the top of the head. Others have two horns. The animals cannot see well, but they have a good sense of hearing and smell. They eat grass, reeds, and twigs.

Mammal

The black rhinoceros of Africa has two horns and is known for its bad temper.

Rhode Island

Rhode Island is the smallest U.S. state. It was one of the 13 original American Colonies. Its official name, The State of Rhode Island and Providence Plantations, dates back to colonial times. Providence was the first settlement and is now the state capital. Rhode Island's nickname, the Ocean State, comes from its coastline along the Atlantic Ocean.

Geography

Rhode Island lies in the northeastern part of the United States. It is one of the states in the New England region. The Atlantic Ocean borders the southern part of the state. Connecticut is to the west and Massachusetts is to the north and east. The eastern half of Rhode

Island is indented by the waters of Narragansett Bay.

Rhode Island has two natural regions. The western two thirds of the state lies within the Appalachian Mountains. It is a rough, hilly region with many forests and lakes. The rest of the state is a shallow lowland area that extends into southern Massachusetts. The lowlands include numerous islands, sandy beaches, and salt marshes. Rhode Island has a damp climate with short summers and long, cold winters.

People

Whites of European heritage make up more than four fifths of Rhode Island's population. The Hispanic population in Rhode Island has grown a great deal. It doubled between 1990 and 2000. During that period, Hispanics went from about 4.5 to almost 9 percent of the population. African Americans make up more than 4 percent of the population.

Economy

Tourism is one of the state's important service industries. Businesses in financial services, insurance, and real estate are also major parts of the economy. Rhode Island's most notable manufactured products are jewelry and silverware.

Harvesting shellfish and fish from the waters off Rhode Island is a vital industry. The most valuable shellfish are lobster and hard-shell clams. Plants grown in nurseries and greenhouses are Rhode

Boats anchor in Newport Harbor in Narragansett Bay, Rhode Island.

Island's leading source of income from agriculture.

History

The Narraganset tribe was the largest Native American group living in the area before Europeans arrived. Portuguese, Italian, and Dutch explorers and traders visited the region in the early 1500s. Roger Williams, a minister, and his followers founded Providence in 1636. They had left Massachusetts in search of religious freedom. In 1663 the king of England granted a charter that officially created the new colony in Rhode Island.

Before the American Revolution started in 1775, Rhode Islanders took part in the first violent protest against the Brit-

ish government. In 1772 a group of townspeople burned a British customs ship that had run aground in Narragansett Bay.

Rhode Island was one of the original 13 states of the Union. In 1790 it was the 13th, and therefore the last, state to ratify, or officially accept, the U.S. Constitution. The state ratified the Constitution only after the document included the Bill of Rights, which guaranteed individual liberties.

Rhode Island served as an operations center for the U.S. Navy during World War I (1914–18) and World War II (1939–45). As the home of the Naval War College, the state continues to play a role in military affairs.

Rhododendron

Gardeners prize rhododendrons for their beautiful flowers.

Rhododendrons are plants with beautiful flowers and glossy leaves. The name rhododendron comes from the Greek words for rose (*rhodon*) and tree (*dendron*).

There are more than 800 species, or types, of rhododendron. They can be found throughout the world except for Africa and South America. Many are found in the Himalayas and the mountains of Malaysia in Asia.

Most kinds of rhododendron are evergreen, meaning that they keep their leaves all year. However, some kinds lose their leaves each autumn. These kinds are usually called azaleas. Rhododendrons also vary greatly in size. Some are tiny shrubs or groundcover that are only 4 inches (10 centimeters) tall. Others are treelike plants that grow more than 40 feet (12 meters) tall.

Most rhododendrons have thick, leathery green leaves. The leaves can be round

or oval. The flowers are usually shaped like a tube or a funnel. They may be white, pink, red, purple, yellow, or blue. Some plants grow large clusters of flowers. Others have single flowers or smaller clusters of two or three blooms. A number of species are known for the strong fragrance, or smell, of their flowers.

Rhubarb

Rhubarb is a vegetable. It grows in long stalks with large leaves at the top. There are several species, or types, of rhubarb. They originally grew only in Asia. The plants are now found throughout the world, but they grow best in places with cool weather. Rhubarb plants are also called pieplants.

Rhubarb plants have green, heart-shaped leaves. Some of the leaves may have large veins or wrinkles. The leaves grow at the end of pink, green, red, or red-green stalks. In some types, the stalks can

The red stalks of a rhubarb plant can be cooked and eaten. The leaves are poisonous.

reach up to 2 feet (60 centimeters) long. After the leaves have grown, sometimes a separate flower stalk may appear. It may have tiny white, yellow, or greenish red flowers at the end of it.

Rhubarb stalks grow from a stem called a crown that grows under the soil. The roots also grow from the crown. Rhubarb roots can live through the winter. Fresh stalks will grow every year starting in early spring.

People use rhubarb in a variety of dishes. Only the stalks of the plant are eaten, however, because the leaves contain a poison. The stalks are crisp and have a tart flavor. Rhubarb is often cooked with sugar and used like a fruit in pies and preserves.

Rice

Rice is a grain that is the main food of about half the world's population. It belongs to the grass family. Its scientific name is *Oryza sativa*. The grain known as wild rice, despite its name, comes from a different plant.

Rice was first planted and grown in India more than 4,000 years ago. Today 90 percent of the world's rice is grown in Asia.

Most rice is grown underwater in paddies. A paddy is a bed of mud with low mud banks around it. The paddy is flooded with 2 to 4 inches (5 to 10 centimeters) of water. The paddy is kept flooded for most of the growing season.

Workers plant rice in a paddy in India.

The rice plant grows to about 4 feet (1.2 meters) tall. It has several stalks with long, flattened leaves. At the end of each stalk is a fan-shaped head made up of green and yellow flowers. These flowers produce the grains of rice.

After harvesting, rice must be processed, or milled. Milling removes outer layers of the rice grains. To produce brown rice, only the first layer, called the hull or husk, is removed. Another layer, called the bran, is removed to create white rice. Brown rice is much higher in nutrients than white rice. Enriched white rice has added B vitamins and minerals.

Rice is eaten alone and in a great variety of soups, side dishes, and main dishes. In eastern Asia people grind rice into flour to make rice cakes and pastry. The people of Japan, China, and India use rice to make liquor. The parts of the plant that are not eaten can be used to make mats, garments, baskets, fertilizer, fuel, and other products.

Richmond

Population
(2000 census),
city, 197,790;
(2007 estimate)
200,123

Richmond is the capital of the U.S. state of Virginia. It lies on the James River. It is a historic city that played an important role in the American Revolution and the American Civil War.

Richmond has a number of notable buildings. The state Capitol was designed by Thomas Jefferson, the third president of the United States. The home of John Marshall, the fourth chief justice of the U.S. Supreme Court, dates from 1790. St. John's Church is where the patriot Patrick Henry gave his famous "Liberty or Death" speech in 1775.

Most people in Richmond work in government or in trade, banking, or other service industries. Factories in the city

make tobacco and food products, chemicals, metals, and other goods.

In 1637 American colonists set up a trading post where Richmond is today. The town was built there in the 1730s. During the American Revolution, Richmond became the capital of Virginia. British troops raided the town in 1781.

Just before the American Civil War, Virginia and 10 other Southern states withdrew from the United States. In 1861 they formed a separate government called the Confederate States of America, or the Confederacy. Richmond became the capital of the Confederacy. In 1865 U.S. troops captured Richmond. Most of the city's business district was destroyed. After the war Richmond recovered rapidly.

Ride, Sally

Sally Ride was a U.S. astronaut. In 1983 she became the first U.S. woman to travel into outer space.

Sally Kristen Ride was born in Encino, California, on May 26, 1951. She graduated from Stanford University in northern California with four degrees, including a doctorate in physics.

In 1978 the National Aeronautics and Space Administration (NASA) selected Ride to train as an astronaut. After com-

Sally Ride sits in the cabin of the space shuttle *Challenger*.

pleting her training in 1979, she worked as a space shuttle mission specialist. On June 18, 1983, Ride made her first voyage into outer space aboard the space shuttle *Challenger*. The shuttle was in space for six days.

Ride took a second trip aboard the *Challenger* in 1984. During this mission Ride's friend Kathryn Sullivan became the first U.S. woman to walk in space. In 1986 the *Challenger* exploded as it was taking off for another mission. Ride was one of the astronauts who helped to investigate the explosion. Ride left NASA in 1987.

Ride later worked as the director of the California Space Institute at the University of California, San Diego. She also wrote several children's books about outer space. In 2003 Ride helped to investigate another space shuttle disaster after the shuttle *Columbia* broke up as it was returning to Earth.

Ring of Fire

A chain of volcanoes surrounds the Pacific Ocean. Because the volcanoes frequently erupt in fiery explosions, the region is known as the ring of fire. Many earthquakes occur in the region as well.

The chain passes along the west coast of North and South America. It runs along the Aleutian Islands and the islands of East and Southeast Asia. Then it extends east and south to New Zealand.

The ring of fire surrounds the edges of the giant Pacific Plate. A plate is a section of the rocky outer layer of Earth. Earth's plates move at different rates and in different directions. As the Pacific Plate and the plates around it grind into each other, they cause earthquakes and volcanoes.

Rio de Janeiro

Population
(2007 estimate), city, 6,093,500; urban area, 11,563,302

Rio de Janeiro is a large city in Brazil, a country in South America. It is the second largest city in the country, after São Paulo. The city lies on the Atlantic Ocean. It is often called Rio for short.

Tourists flock to Rio for its beautiful beaches and for a yearly festival called Carnival. The city celebrates Carnival for four days before the Christian season of Lent begins. Lively parades and parties last day and night. People in colorful costumes sing and dance in Rio's streets.

Places of Interest

A large statue of Jesus called Christ the Redeemer overlooks Rio de Janeiro. It

Rio de Janeiro lies on a bay of the Atlantic Ocean. A towering rock called Sugar Loaf stands at the entrance of the bay.

stands on Mount Corcovado. A rock called Sugar Loaf is another major landmark. The rock offers great views of Rio's beaches below. Two of its best-known beaches are called Copacabana and Ipanema.

Economy

Tourism is a major part of Rio de Janeiro's economy. Banking, trade, and other services are also important. The city is one of Brazil's main manufacturing centers. Factories in Rio make clothing, medicines, metal products, and processed foods. The city is also a major port.

History

Portugal took control of Brazil in the 1500s. Many American Indians already lived in the Rio area. Portuguese sailors entered the area's harbor in January 1502. They thought it was the mouth of a river. Because of this they named the site Rio de Janeiro, which means "river of January." Portuguese settlers began moving there in the 1560s.

In the 1700s the Portuguese used Rio as a port to ship out gold and diamonds. In 1763 they made it the capital of their colony of Brazil. The city grew greatly.

Brazil became an independent country in 1822. Rio was its capital. In 1960 the capital was moved to the city of Brasília. However, Rio de Janeiro remained important to Brazil's economy.

River

A river is a large, natural stream of water that flows over land. Rivers shape the land by carving out canyons and other valleys. Humans have used rivers in many ways. Many ancient civilizations grew up near rivers.

River Courses

A river begins as a tiny trickle of water on high ground. The water may come from rainfall, from melting snow or ice, or from underground. The trickle com-

A boat pushes barges on the Mississippi River.

bines with other trickles as it flows downhill. It may be called a stream, a brook, or a creek.

Eventually the creek grows into a river. In its upper course the river flows rapidly. It cuts through the land and picks up soil and gravel. In its middle course the river flows down gentler slopes. It gets larger and slower. Soil, gravel, and sand begin to sink to the bottom.

In its lower course the river flows even more slowly. It drops still more solid material. Some material is carried all the way to the mouth—the place where the river enters the sea. This material may build up to form a piece of land called a delta.

River Systems

A river receives water from the smaller streams that flow into it. These streams are called tributaries. A river and its tributaries make up a river system. The area that a river system covers is called a basin. Rivers that are the same length may have basins of different sizes. The Amazon River is slightly shorter than the Nile River, but the Amazon has a basin more than twice as large.

Importance to Humans

Humans drink river water. They catch fish from rivers. They also use river water to grow crops. They often do this by digging ditches that carry water to farm fields. This practice is called irrigation.

Before modern times, people often traveled on rivers. Large riverboats called barges still carry grain, coal, and minerals.

Flooding creates problems for people who live near rivers. People have built dams across many rivers to control floods. As water flows through a dam it often runs through generators that create electricity.

People also put waste into rivers. This practice has made river pollution a serious problem.

Rivera, Diego

The Mexican artist Diego Rivera is known for creating large murals, or wall paintings. In his murals he represented

Diego Rivera painted a mural in San Francisco, California, that combines images of traditional Mexican art with images of modern North American technology.

scenes from Mexico's history, telling of its cultures, farming and industry, wars, and politics. His paintings feature bright colors and are crowded with people and symbols.

Rivera was born on December 8, 1886, in Guanajuato, Mexico. At age 10 he earned a scholarship to study art in Mexico City. In 1907 he won a scholarship that allowed him to travel to Europe. He studied art in Spain and then settled in Paris, France.

In Paris Rivera began painting in a style called cubism. In this style the subject is broken apart into basic shapes, such as squares, triangles, and circles. In about 1917 his style changed. He began to use simple forms and bold areas of color.

In 1921 Rivera returned to Mexico. He and the Mexican painter David Alfaro Siqueiros hoped to create a new kind of art especially for Mexico. They wanted to paint murals on buildings where everyone could see them. The murals would tell the stories of the Mexican people.

Rivera completed his first important mural in 1923. He was soon hired to paint murals on several public buildings in Mexico. Between 1930 and 1934 Rivera painted murals in the United States. He died on November 25, 1957, in Mexico City. Frida Kahlo, his wife, also was a famous painter.

Road

Cars, trucks, buses, motorcycles, and bicycles travel on strips of land called roads. Some roads are made of dirt or gravel. A firm, strong material called pavement covers most modern roads. Types of roads include city streets, country roads, and long-distance highways.

How Roads Are Built

There are many steps in road building. First, road builders choose a route, or path, for the road. They must carefully study how the road will affect the businesses, homes, traffic, plants, and animals of the area. Next, road builders buy the land on which they will build the road.

Construction of unpaved roads (roads without pavement) is simple. Builders clear away trees, bushes, and plants from the roadway—the strip of land over which the road will pass. Then they smooth out the roadway and press the surface down with a machine called a

roller. This type of road is suitable for areas where few cars travel.

Roads that many cars will use must be stronger than roads that have less traffic. These roads are paved. Paving materials include asphalt and concrete. Asphalt is a thick, dark, flexible material made from petroleum, or oil. Concrete is a mixture of cement, water, sand, and gravel. When it dries it becomes as hard as stone.

A strong road may start with a layer of asphalt. On top of the asphalt is a layer of sand, gravel, or crushed stone. A final layer of asphalt or concrete finishes the road. The concrete may have steel rods or mesh inside it for extra strength.

Most major modern roads are built with a gentle slope downward from the center of the road outward. This slope is called a crown. The crown allows water to run off the road. These roads also have a system for draining water away from the sides.

An unpaved country road makes a pretty picture. But such a road turns to mud in wet weather, and it cannot handle heavy traffic.

Did You Know?

The first major road was the Persian Royal Road in western Asia. It was more than 1,700 miles (2,700 kilometers) long and was used from about 3500 to 300 BC.

Roadrunner

Certain birds in the cuckoo family are called roadrunners. Roadrunners can fly, but they are rather clumsy in flight and get tired quickly. They prefer to dash around on their powerful legs. A roadrunner sometimes reaches speeds of more than 15 miles (24 kilometers) per hour. While running, it stretches out its neck, spreads out its short wings, and jerks its long tail up and down.

There are two kinds of roadrunner. The greater roadrunner lives in Mexico and the southwestern United States. The lesser roadrunner is found in Mexico and Central America. Most roadrunners live in deserts and other open areas without many trees.

The greater roadrunner is about 22 inches (56 centimeters) long. Its feathers are streaked in olive-brown and white. The lesser roadrunner is somewhat smaller and less streaked. Both kinds have a short tuft of shaggy feathers, called a crest, on the head.

Roadrunners are usually seen on the ground, where they feed on small animals.

Drivers use the ramps of a cloverleaf intersection to get on and off a long-distance highway. Cloverleafs cost so much money and take up so much land that they are usually spaced far apart.

History

Peoples in ancient Egypt and western Asia built the earliest roads more than 4,000 years ago. Later the ancient Romans became famous as road builders. They built roads paved with stone across Europe. The Spanish built the first roads in North America along Native American trails. Early roads in colonial America were usually dirt, sometimes covered with rows of logs.

Before automobiles were invented in the late 1800s, people used roads to travel by foot, by horse, and by wagon. As cars became popular in the early 1900s, people began building more roads paved with concrete and asphalt. In the 1950s the United States began building a system of large roads, called highways, across the country. Today highways cross many countries. But some poor countries still have mostly unpaved roads.

Robin

Robins are familiar and much-loved songbirds with reddish chest feathers. Several species, or types, of bird are called robins. The best-known types are the American robin and the European robin. Early European settlers in North America named the American robin after the European bird. Both these types belong to the thrush family, along with bluebirds and nightingales. But American and European robins are not closely related.

American and European robins were originally woodland birds. They are now also commonly found in gardens, on lawns, and in parks. American robins are found throughout most of North America. Most of them fly south for the

The American robin has a reddish breast and belly.

The European robin has a reddish face and breast.

winter. European robins are found throughout Europe and in parts of western Asia and northern Africa. Some of the robins of northern Europe fly south for the winter.

The American robin is about 10 inches (25 centimeters) long. It has an orange or dull reddish breast and belly. The head is black, and the upper parts are dark gray. Females and young males are paler than adult males.

The European robin is much smaller, with a length of about 5.5 inches (14 centimeters). It has orange-red feathers on its breast, throat, and face. The belly is white, and the upper parts are brownish olive.

Both types of robin are often seen hopping across lawns. They look for worms or insects to pull up from the soil. American robins eat worms, insects, and

fruits. European robins eat mainly insects but also some worms, fruits, and seeds.

Robinson, Jackie

Jackie Robinson played 10 seasons for the Brooklyn Dodgers. His lifetime batting average was .311.

Jackie Robinson was the first African American to play baseball in the modern era of the major leagues. He played as an infielder and outfielder for the Brooklyn Dodgers from 1947 through 1956.

Early Life

Jack Roosevelt Robinson was born on January 31, 1919, in Cairo, Georgia. He grew up in Pasadena, California. He was a star athlete in football, basketball, track, and baseball at the University of California at Los Angeles (UCLA).

From 1942 to 1945 he served in the U.S. Army.

After leaving the Army Robinson played baseball for the Kansas City Monarchs. The team belonged to the Negro American League. At that time only white players were allowed in the major leagues.

Major League Career

Branch Rickey, president of the Brooklyn Dodgers, was interested in making major league baseball open to black players. He knew that the first African American brought into the majors would have to be very special. When Rickey met Robinson, he knew he had found the right person. Robinson first played for the Dodgers in 1947. At the end of the season he was chosen as the best new player in baseball. In 1949 he was chosen as the most valuable player in the National League.

Although Robinson played well, things were not always easy. Players and people in the crowd often shouted hateful things at him. Pitchers sometimes threw the ball at him on purpose. But Robinson refused to quit.

Robinson helped the Dodgers win six National League pennants and one World Series title. He retired from baseball in 1957.

Later Years

Robinson then became a businessman and worked for civil rights. In 1962 he became the first black player in the Base-

Robot

Sony Corporation built a robot that can throw a baseball.

A robot is a machine that does tasks without the help of a person. Many people think of robots as machines that look and act like people. Most robots, though, do not look like people. And robots do only what a person has built them to do.

How Robots Work

Most robots are computer-controlled devices with many parts. An industrial

robot, for example, is an armlike machine that can turn at several joints. It has a handlike part to grasp and hold things. Motors move the parts.

Some robots can be “taught” to do a job. For example, a person might guide an industrial robot through the movements needed to do something. Sensors on the robot send signals about the movements to the computer. The computer stores the pattern of movements. Later the computer can retrieve the pattern and tell the robot what to do.

Uses

Most industrial robots are used in factories. Some robots load, move, and unload materials. Others are used on assembly lines to help build things such as cars and appliances.

Robots are especially useful because they can do things that could be dangerous for people. For example, they can be sent deep underwater or into space. Robots can also handle dangerous materials such as radioactive waste or harmful chemicals. They can even dispose of bombs or do spy work for the military.

History

Writings from ancient Greece and China tell of toys called automatons, which were like robots. They were set in motion by steam, air, water, or falling weights. In the late 1700s and early 1800s complex automatons could play music or write with a pen on paper. During this time people also built machines to help do certain kinds of work. Modern robots only came about

after computers were invented. With computers, people could program robots to do tasks on their own.

Robots in Science Fiction

Robots often appear in science fiction, or stories set in the future or in another world. Robots in science-fiction books, television shows, and movies can often think, listen, talk, and walk easily on two legs. Science-fiction robots that look exactly like humans are known as androids. Although real robots are becoming more complex, they still are not like these imagined robots.

Rock

Rock, or stone, is a hard material made up of one or more minerals. Rock makes up the outer layer of Earth, called the crust. The lower parts of this layer are solid rock, or bedrock. Broken bits of rock lie on top. The tiniest bits of rock make up sand and soil. Underneath Earth's crust is a layer of melted rock, called magma.

Types of Rock

There are three types of rock: igneous, sedimentary, and metamorphic. These names describe how each type of rock was formed.

Igneous rock is hardened magma. Magma may escape through cracks in Earth's crust. It may also come to Earth's surface when a volcano erupts.

Wave Rock in Australia is a formation of granite, an igneous rock. The colored bands are not layers but stains.

As the escaped magma cools, it hardens into solid rock. Granite and basalt are examples of igneous rock.

Devils Postpile in California is a formation of basalt, an igneous rock. Lava slowly hardened to create the columns.

Limestone, a sedimentary rock, makes good paving blocks.

Sedimentary rock may form from pieces of other rock. In a process called erosion, wind and water slowly break rock into tiny pieces. Water washes the pieces into rivers. They settle along the river bottom in soft, loose layers called sediment. Over millions of years the sediment builds up, hardens, and becomes solid rock. Sandstone is a sedimentary rock that forms in this way. Sedimentary rock also may form from the remains of dead animals or plants. Limestone is a sedimentary rock that is made up of the

Slate is a metamorphic rock that splits off into flat layers.

shells and stony skeletons of certain kinds of living things.

Metamorphic rock forms from old igneous or sedimentary rock. Several forces can change old rock into new metamorphic rock. Great heat and pressure inside Earth's crust can shape old rock into metamorphic rock. Water can dissolve minerals in old rock or carry new minerals into it to form metamorphic rock. The heat of magma can also change old rock into metamorphic rock. Marble and slate are examples of metamorphic rock.

The Rock Cycle

Rock is always being formed, worn down into pieces, and then formed again. This is called the rock cycle. Rock wears down through erosion. Pieces of rock then settle down and slowly become sedimentary rock. If sedimentary rock becomes deeply buried, it may melt into magma. Then the magma may return to the surface as igneous rock. Deeply buried rock may also become metamorphic rock. The rock cycle takes many millions of years.

Rocket

Rockets are devices that produce the force, or push, needed to move an object forward. Rockets are used to launch spacecraft. They are also used to shoot missiles and fireworks.

Liquid-Fuel Rocket**Solid-Fuel Rocket**

Rocket fuel can be liquid or solid. When the fuel burns, it gives off gas that pushes the rocket forward.

How Rockets Work

Rockets carry fuel that is burned inside a chamber. The fuel burns when it is mixed with oxygen gas and ignited, or set on fire. As the fuel burns, it gives off hot gas that shoots out from an opening at the back of the chamber. The force of the gas moving backward pushes the rocket forward. This action is called jet propulsion.

The engines of a jet airplane also use jet propulsion. But unlike a jet engine, rockets carry their own oxygen supply. This makes rockets valuable in outer space, where there is no oxygen.

Rocket fuel can be liquid or solid. The U.S. space shuttle uses both liquid and solid-fuel rockets. Two solid-fuel booster rockets launch the shuttle into space. Three liquid-fuel rocket engines allow it to move in and out of orbit.

History

The Chinese probably invented rockets in the 1200s. They made rockets by

filling bamboo cases with gunpowder. The Chinese used their rockets during religious ceremonies and as weapons. In the 1700s rockets were improved by making them with metal. Rockets were used as weapons in many wars of the 1800s and 1900s, especially World War II (1939–45).

In the late 1800s a Russian scientist named Konstantin E. Tsiolkovsky got the idea that rockets could be used to travel into space. He did not build any rockets, but his ideas about them were useful. Robert H. Goddard, a U.S. engineer, built the first liquid-fuel rocket in 1925. In October 1957 the Soviet Union used a rocket to launch the first spacecraft, Sputnik 1, into orbit around Earth.

Rock Music

Rock is a style of popular music. Since the 1950s, rock has probably had more fans than any other form of music.

Rock music has had many styles and forms over the years. One thing that most rock music has is a strong beat. Rock almost always focuses on the singer or singers. It often features electric guitars along with drums, electric bass, and sometimes piano or organ. Some rock musicians also use saxophones, trumpets, and other horns in their music. Rock music styles include country rock, heavy metal, alternative rock, punk rock, and many others.

Did You Know?

All speed and distance records—on land, in air, and in space—have been set by rocket systems.

The Early Days of Rock

Rock first appeared in the United States in the 1950s. In the early days it was called rock and roll. It developed from other music styles, especially African American popular music (called rhythm and blues), gospel music, and country music.

Chuck Berry was one of the first rock-and-roll singers and songwriters. Elvis Presley was the first rock-and-roll superstar. Other influential artists of the early period included Little Richard, Bill Haley, Bo Diddley, Fats Domino, Carl Perkins, Jerry Lee Lewis, and Buddy Holly. Teenagers were the biggest fans of rock and roll. Rock-and-roll songs expressed feelings in a way that young people thought was powerful and truthful. But many adults thought the music was too wild.

Rock musicians Lenny Kravitz (left) and Mick Jagger perform together at an awards ceremony.

Later Performers

After the late 1950s rock and roll changed into many forms. People began to call it simply rock music. It also spread to other parts of the world. In the early 1960s many British groups became popular. These included the Beatles, the Rolling Stones, and the Who. U.S. rock stars of the 1960s included the Beach Boys, Bob Dylan, Janis Joplin, the Grateful Dead, Jimi Hendrix, and Led Zeppelin.

Bruce Springsteen, Aerosmith, Kiss, the Police, the Talking Heads, and the Clash were just a few of the rock artists that appeared in the 1970s. In the 1980s such rock artists as Madonna, Prince, R.E.M., Guns N' Roses, U2, and the Red Hot Chili Peppers became famous. In the 1990s and early 21st century Nirvana, Pearl Jam, Radiohead, No Doubt, Coldplay, and Wilco were some of the top rock artists.

Rocky Mountains

The Rocky Mountains are a massive mountain range of western North America. They are called the Rockies for short. The Rockies include some of North America's highest peaks. In the past they formed a great barrier to explorers and settlers.

The Rockies are more than 3,000 miles (4,800 kilometers) long. They cover parts of the U.S. states of Montana, Idaho, Washington, Wyoming, Utah, Colorado, and New Mexico. In Canada, they extend into British Columbia, Alberta, and the Yukon and Northwest Territories. Sometimes Alaska's mountains are called part of the Rockies, too. Mount Elbert, in Colorado, is the highest peak. It is 14,433 feet (4,399 meters) high.

Rocky Mountain forests include aspen, white pine, Douglas fir, western hemlock, and western red cedar trees. The animals of the Rockies include bighorn sheep, mountain goats, mountain lions, American elk (wapiti), reindeer, and grizzly bears. Bald eagles, golden eagles, peregrine falcons, and other large birds soar above the mountains.

The spectacular scenery of the Rockies attracts many tourists. National parks of the region include Yellowstone, Jasper, Banff, Yoho, and Kootenay. The Rockies are also rich in minerals. Mines provide copper, gold, silver, lead, and zinc. There are also supplies of oil, natural gas, and coal.

Native Americans may have lived in the Rocky Mountain region as early as 12,000 years ago. The groups of the northern mountains included the Kootenai, the Shoshone, the Coeur d'Alene, and the Flathead. The Ute, the Navajo, the Hopi, and the Pueblo lived farther south.

The Rockies were one of the last parts of North America to be explored by Europeans. The rough terrain and harsh weather made exploration difficult. In 1793 the Scottish explorer Alexander Mackenzie crossed the Canadian Rockies. The Lewis and Clark Expedition

The climate in the Rocky Mountains varies widely. In summer only a short distance may separate warm foothills from frosty peaks.

crossed the Rockies in what are now Montana and Idaho in 1805.

Rodent

Rodents are mammals with long, sharp front teeth that they use for gnawing. They are found almost everywhere in the world. More than half the mammals on Earth are rodents. Rats, mice, squirrels, chipmunks, gerbils, hamsters, lemmings, beavers, guinea pigs, and porcupines are all rodents.

Most rodents are small. Some mice and dormice are only 3 inches (8 centimeters) long and weigh as little as 0.7 ounce (20 grams). The largest rodent by far is the capybara of South America. It can be 4 feet (1.3 meters) long and weigh more than 100 pounds (45 kilograms).

The capybara of South America is the largest rodent.

Rodents are different from other mammals because they have teeth that keep growing throughout their lives. They have one upper pair and one lower pair of these teeth, which are called incisors. Rodents spend much of their time gnawing, or nibbling at, hard objects to wear their incisors down. If the incisors grow too long, the rodent cannot eat. The incisors can even grow back into the skull and kill the animal.

Rodents can be pests. They can ruin farmers' crops and stored grains. Their gnawing can damage boards in houses, barns, or even metal telephone cables. Some rodents carry diseases that may infect people.

But some rodents are valuable to people. People use the fur of nutrias and chinchillas to make clothing. They keep hamsters, guinea pigs, and gerbils as pets. Mice, rats, and other rodents are useful in scientific research.

Roller Skating

Roller skating is a fun pastime and a competitive sport. Roller skaters wear shoes or boots with small wheels on the bottom. They skate outdoors on sidewalks and other paved areas. They also skate indoors in buildings called rinks.

Roller-skating sports include hockey, speed skating, figure skating, and danc-

Children enjoy in-line roller skating. They wear helmets and pads for protection from injury.

ing competitions. These are similar to traditional ice-skating sports. Today roller skaters also compete in “extreme” sports such as vertical skating. Vertical skaters jump from ramps and perform tricks in the air.

Roller skates were invented in the 1760s. Early skates were modeled on the ice skate. They had an in-line arrangement of wheels. This means that the wheels formed a single straight line along the bottom of the skate, where the blade is on an ice skate. Skaters found it hard to turn or stop while using these early skates.

In 1863 James Plimpton of the United States designed the first roller skates that were widely used. Plimpton’s skates had four wheels arranged in a rectangular pattern. This design made it easier for skaters to turn. Other changes in the late

1800s helped in braking and created a smoother ride.

The improved skates helped to make roller skating very popular in the early 1900s. In the 1960s plastic wheels began to replace metal ones. The plastic wheels gripped the skating surface better. A new type of in-line skates, often called Rollerblades, became popular in the 1980s.

Rom

A Rom is a member of the group of people called Roma. The Roma have traditionally been nomads, moving from place to place. They originally came from northern India. Today most Roma live in Europe, especially the Czech Republic, Slovakia, Hungary, Serbia, Montenegro, Bulgaria, and Romania. There are about 8 to 10 million Roma in Europe. Roma are also known as Gypsies.

Roma play music and dance at a festival in the Czech Republic.

Did You Know?

The Roma are the largest minority group in Europe.

The Rom language is called Romany. Romany is based on Sanskrit, the ancient language of India. Roma also usually speak the main language of the country in which they live.

Not all Roma are nomads. Some have settled in cities and blended in with the population. The Roma who are nomads travel together in small bands. Some travel by car and sleep in tents or trailers at night. A few still travel and live in caravans, or horse-drawn wagons. Sometimes traveling Roma live for a while in houses, apartments, and even empty stores.

Nomadic Roma usually hold jobs that fit in with their wandering lifestyle. Some modern Roma make money by fortune-telling, playing music, or selling used cars and trailers. In the past Roma sold livestock and helped farmers with animal care. They also repaired pots, pans, and other metal products.

Roma first traveled beyond northern India in about the year 1000. They moved into Persia (Iran) and Armenia. They reached eastern Europe by the 1300s and western Europe by the 1400s. By the second half of the 1900s Roma had spread to North America, South America, and Australia. At times Roma have been mistreated or even killed just because of their ethnic background. Today some countries are working to improve conditions for Roma.

Roman Catholicism

Roman Catholicism is the oldest and largest branch of Christianity. There are more than 1 billion Catholics worldwide. The Roman Catholic church is led by the pope. The pope rules the church from Vatican City, which is a separate country inside Rome, Italy.

Beliefs and Practices

Like all Christians, Catholics base their beliefs on the Christian Bible. For example, they believe that Jesus was the son of God. Roman Catholics also believe that Mary, the mother of Jesus, is a very important holy person. Unlike Protestant Christians, Catholics pray to Mary. Catholics also pray to a number of saints. Saints are men and women who did great deeds to support the Catholic church.

Roman Catholics generally attend a service called Mass on Sunday mornings.

A Roman Catholic priest holds up bread and wine during a Mass. Roman Catholics eat bread and drink wine during a ritual called Communion.

Catholics also perform rituals, or special signs of their faith, called sacraments. One sacrament is Communion. During a Mass a priest blesses bread. Catholics believe that the bread then turns into Jesus' body. At Communion Catholics eat the bread.

History

The history of the Roman Catholic church goes back to the beginning of Christianity about 2,000 years ago. After Jesus' death, Christianity spread throughout the Middle East and Europe. At that time the Roman Empire ruled these regions. At first the Romans had their own religion, and they often mistreated Christians. But in the AD 300s the Romans made Christianity their main religion.

The western part of the Roman Empire was conquered in the 400s, but Christianity stayed strong. The city of Rome remained the center of the church. The leaders of the church gained more and more power. They came to be known as bishops. Eventually the bishop of Rome gained the title of pope. He became the head of the entire church. Today a special group of bishops called cardinals elects the pope.

After the western part of the Roman Empire came to an end, the eastern part continued as the Byzantine Empire. The bishops there began to disagree with the popes. Finally the eastern and western parts of the church split in 1054. The eastern part became the Eastern Orthodox churches. The western part became the Roman Catholic church.

Worshippers attend mass at a Roman Catholic church in South Africa. In the late 20th century the church gained many new followers in Africa, Latin America, and parts of Asia. By the early 21st century about two thirds of all Catholics lived in those areas.

The Roman Catholic church was the most powerful organization in western Europe for hundreds of years. At times, however, more than one person claimed to be the pope. From 1378 to 1417 there were rival popes at Rome and Avignon, France. This period was called the Great Western Schism.

In the 1500s people who disagreed with church teachings began to form new Christian churches. This movement was called the Protestant Reformation.

Meanwhile European explorers and settlers brought Roman Catholicism to the Americas. Catholic missionaries (people working to spread their religion) also helped to spread Roman Catholicism around the world.

Romania

Romania is the largest country on the Balkan Peninsula in eastern Europe. Romania's name came from the Roman Empire, which ruled the region in ancient times. Bucharest is Romania's capital and largest city.

Geography

Romania borders Bulgaria, Serbia, Hungary, Ukraine, and Moldova. The Black Sea lies to the southeast.

The Carpathian Mountains run through the northern parts of Romania. The Carpathians surround a central region called Transylvania. Plains cover southern Romania. The Danube River flows along Romania's southern border.

Plants and Animals

The Carpathians have many forests. Oak trees grow on the low mountain slopes. Beech, fir, and spruce trees grow

Mountains and rolling hills cover large parts of Romania.

in higher areas. Grasses and scattered trees grow on the plains.

The goatlike chamois lives high in Romania's mountains. Brown bears, red deer, wolves, foxes, wild pigs, and lynx live in the forests. The country's birds include eagles, vultures, and hawks.

People

Most of the people of Romania are Romanians. Their language, called Romanian, has its roots in Latin—the language of the Roman Empire. The country has smaller groups of Hungarians, Roma (Gypsies), Germans, and Ukrainians. Most Romanians are Eastern Orthodox Christians. More than half of the population lives in cities or towns.

Economy

Services—including banking, communications, and health care—are

a major part of Romania's economy. Manufacturing, mining, and logging are also important. Factories make machines, fuels, steel, chemicals, and clothing. Mines provide coal, natural gas, and oil.

Many Romanians still live by farming. Crops include wheat, corn, potatoes, and sugar beets. Romanians also grow grapes to make wine. The main livestock are sheep and pigs.

History

The region that is now Romania was known as Dacia in ancient times. The Roman Empire ruled Dacia from AD 106 until the late 200s. Over the next 800 years Goths, Huns, Slavs, and other peoples invaded Dacia. In the 1000s the Hungarians took over what is now Transylvania.

The Formation of Romania

In the early 1300s the people south of the Carpathian Mountains formed a state called Walachia. The people east of the Carpathians formed a state called

Sheep graze near a castle in Romania.

Moldavia. Walachia and Moldavia were the first Romanian states.

In 1859 Walachia and Moldavia elected a single prince to rule both of them. The two states became the independent state of Romania. Romania gained Transylvania from Hungary in 1918.

Communist Rule

The Soviet Union took control of Romania during World War II (1939–45). The Soviets helped to set up a Communist government in Romania by 1948. The Communist leader Nicolae Ceausescu ruled harshly during the 1970s and 1980s. In 1989 Communist governments in neighboring countries began to collapse. That December the Romanian military executed Ceausescu.

Modern Romania

Romania held free elections in 1990. The new leaders worked to improve the economy.

Roman Numerals

Roman numerals are often used on clocks.

Roman numerals are a system for representing numbers with letters of the Latin, or Roman, alphabet. The system dates back about 2,000 years, to the time of ancient Rome. Roman numerals have been mostly replaced by Arabic numbers (1, 2, 3...).

How Roman Numerals Work

The Roman numeral system uses seven letters as numerals: I = 1; V = 5; X = 10; L = 50; C = 100; D = 500; M = 1,000. The numerals can be written as either capital or lowercase letters. A bar over a numeral multiplies its value by 1,000: for example, \overline{V} = 5,000 and \overline{X} = 10,000.

When a numeral is followed by one of equal or lesser value, their values are added together: II = 2; VI = 6; CLV =

155. This system could create very long numbers if numerals could be repeated without limit (for example, IIII or CCCC). To avoid this problem, the system uses subtraction within the numbers. A numeral is never used more than three times in a row. Instead of repeating the numeral a fourth time, the value is expressed by a smaller numeral followed by a larger numeral. The smaller numeral is subtracted from the larger one. For example, instead of IIII, the number 4 is written as IV (5 – 1). The number 400 is written as CD (500 – 100).

Only certain combinations of numerals are used in this way. For instance, 1,999 is written in Roman numerals as MCMXCIX rather than MIM. This number breaks down as follows: M (1,000) + CM (900) + XC (90) + IX (9). The number 2,000 is written MM; 2,001 is MMI; 2,002 is MMII; 2,003 is MMIII; 2,004 is MMIV; and 2,005 is MMV.

Using Roman Numerals

People generally find Arabic numbers easier to use than Roman numerals. But Roman numerals are still used decoratively on some clocks and watches. They are used to indicate dates on monuments and buildings. They are also used to number the front pages of books. Kings, queens, and popes who have the same name often put Roman numerals after their name.

Rome

Population
(2007 estimate)
2,705,603;
urban area,
3,339,000

Rome is the capital of Italy, a country in southern Europe. In ancient times it was the capital of the mighty Roman Empire. Today the city is a center of culture and tourism. People from all over the world travel to Rome to see its historic monuments and art treasures.

Rome lies on the Tiber River. It was built on seven hills. Rome surrounds Vatican City, the center of Roman Catholicism. Vatican City has been an independent country since 1929.

Places of Interest

Rome is filled with notable palaces, churches, and public squares called piazzas. The city also has more than 300 public fountains. Museums such as the Borghese Gallery display famous works of art.

The remains of many ancient monuments still stand in Rome. The Colosseum was an outdoor arena with rings of seats. Fighters called gladiators fought fierce battles there. The buildings of the Roman Forum were the center of public life in ancient Rome. Ancient art can also be seen in the Capitoline Museums.

Economy

The economy of Rome is largely based on government and tourism. Other leading industries include construction, publishing, and services such as banking and trade. The city also has some manufacturing.

History

People settled in the Rome area more than 2,700 years ago. In the 500s BC the city became a state called a republic. Soon Rome began taking over other lands. By the 1st century AD the republic had become a huge and powerful empire. Rome was the capital of the Roman Empire until AD 330.

In the 500s the pope—the leader of the Roman Catholic church—began taking control of Rome and the surrounding area. The popes ruled Rome for hundreds of years.

In the 1400s and 1500s Rome was a center of the artistic movement called the Renaissance. Great artists created

Trevi Fountain is one of the most famous sights in Rome, Italy. A legend says that visitors who throw a coin into the fountain will return to Rome one day.

buildings, paintings, and sculptures throughout the city.

In 1861 the Kingdom of Italy was created. But the pope still ruled Rome. In 1870 Italian troops marched into Rome. The city then became the capital of Italy.

Rome, Ancient

The ancient city of Rome was the center of one of the largest and most powerful empires the world has ever seen. The Roman Empire was based in what is now Italy. With its great army, it conquered other lands and peoples around

the Mediterranean Sea. The empire spread across Europe and into western Asia and northern Africa.

Roman Culture

Ancient Rome made many lasting contributions to world culture. But the Romans also absorbed the culture of the peoples they conquered. For instance, the Romans took many ideas about art from the ancient Greeks. Romans also worshipped many Greek gods, which they gave new names. Later, Rome adopted Christianity, a religion from the Middle East.

Painting, sculpture, and other forms of art were important to the Romans. Architects built huge buildings that were central to Roman life, including the Colosseum.

The ancient Romans created many designs called mosaics out of tiny tiles. The ones that survived show what everyday life was like in ancient Rome.

Roman writers wrote history, comedy, tragedy, and poetry. From Latin, the ancient Roman language, many other languages later developed. These languages, known as the Romance languages, include French, Spanish, Portuguese, Italian, and Romanian. People today use the Latin alphabet to write these and other Western languages, including English.

History

Kingdom

According to legend, twin brothers named Romulus and Remus founded Rome in 753 BC. Shortly before 600 BC, warriors from Etruria, a region north of Rome, attacked the city. The warriors, called Etruscans, conquered Rome. Rome grew steadily under Etruscan kings. In about 509 BC the Romans

forced the last Etruscan king out of the city. Rome then became a republic. This meant that the Roman people elected the government.

Republic

The most important Roman leaders were called consuls. There were two consuls. Assemblies, or groups, of adult male Roman citizens chose both consuls. At first the consuls had to be patricians, or members of upper-class families.

An important group called the Senate gave advice to the consuls. The members, called senators, were patricians. They met in a public building called the Forum. The Senate grew more powerful over the years.

Most Romans were not patricians but plebeians, or common people. The plebeians staged an uprising in 494 BC. They gradually won more power. By 367 BC one of the two consul positions was set aside for the plebeians.

Rome suffered some setbacks as it slowly expanded its territory. In about 390 BC a northern group called the Gauls took over the city. They would not leave until the Romans paid them a large amount of gold. Another group called the Samnites defeated the Romans in 321 BC. In general, however, Rome's conquests could not be stopped. By 275 BC Rome had forced the Greeks to give up their colonies in Italy.

By 260 BC Rome's last remaining rival in the western Mediterranean was the city of Carthage, in North Africa. For more

Did You Know?

The Appian Way was a famous ancient Roman road. It went to southern Italy and was paved with stone blocks. It was about 360 miles (580 kilometers) long.

than a century the Romans fought Carthage for power. It took three wars—called the Punic Wars—before the Roman forces totally destroyed Carthage in 146 BC.

Rome then turned to other areas, including Sicily, Spain, Macedonia, Greece, and Asia Minor (now Turkey). Governors called proconsuls managed most of the conquered lands. They had great power. The Romans taxed the conquered people heavily. They also enslaved many conquered people.

Empire

In about 133 BC Rome entered a period of unrest and civil war. Peoples in Italy rebelled against Rome's strict rule in 90 BC. During 73–71 BC a gladiator, or professional fighter, named Spartacus led an army of runaway slaves in a war against Rome. Rome defeated both of these rebellions.

The Colosseum was completed in AD 82. It was the scene of many public gatherings almost 2,000 years ago. Much of it still stands in the city of Rome.

Meanwhile, Rome continued to expand its empire. The most successful general was Julius Caesar. He won victories in far-off areas and then took power in Rome. However, his enemies assassinated him in 44 BC. This set off another period of civil war.

Peace finally came under the leadership of Julius Caesar's grandnephew Octavian. Octavian defeated his rivals for power, including the Roman general Mark Antony and the Egyptian queen Cleopatra, by 30 BC. He was crowned Rome's first emperor in 27 BC. He became known as Augustus Caesar.

Two centuries of peace and progress followed. The empire's frontiers expanded all the way to Britain and the Arabian Peninsula. The Romans built roads, bridges, and aqueducts, or water pipes, throughout their vast empire. They also brought their laws to conquered lands.

The emperor Tiberius ruled from AD 14 to 37. During this time the Roman government in Palestine put Jesus to death. Some of Jesus' followers, called Christians, later set up a community in Rome. At first the Romans did not agree with the Christian religion. They mistreated and killed many Christians. But in AD 312 the emperor Constantine I became a Christian himself. Christianity eventually became the main religion of the Roman Empire.

Downfall

By this time, the empire was weakening. Constantine believed he could

strengthen the empire if he moved its center away from Rome. In 330 he created a new capital in the Greek colony of Byzantium. He renamed the city Constantinople.

After the death of the emperor Theodosius I in 395, the Roman Empire split in two. The Eastern Roman Empire was based in Constantinople. The Western Roman Empire was based in Rome. Several groups of outside peoples, including the Vandals and the Huns, attacked the western empire. A group called the Visigoths attacked the city of Rome in 410. The last western emperor fell in 476. This brought an end to the Western Roman Empire. The eastern empire continued as the Byzantine Empire until 1453.

Roosevelt, Eleanor

Eleanor Roosevelt was married to Franklin D. Roosevelt, who was president of the United States from 1933 to 1945. She was widely respected for her many activities as first lady. Later she worked at the United Nations helping people around the world.

Anna Eleanor Roosevelt was born on October 11, 1884, in New York City. She grew up in a wealthy family that valued community service. Eleanor was

Eleanor Roosevelt

the niece of Theodore Roosevelt, the 26th president of the United States. In 1905 she married Franklin Roosevelt, her distant cousin.

During World War I (1914–18) Eleanor worked for the Red Cross. Later she taught at a girls' school that she partly owned. In the 1920s Eleanor became active in politics.

Franklin D. Roosevelt became president in 1933. He had a disability that made it hard for him to travel. Eleanor crisscrossed the country in his place. She talked to people from all walks of life and reported back to the president. She defended the rights of African Americans, youth, women, and the poor.

During the 1930s the United States was struggling through the Great Depression. President Roosevelt tried to end the country's economic problems with a group of government programs called the New Deal. Eleanor organized a New

Deal program called the National Youth Administration. It created jobs for millions of college students.

Franklin Roosevelt died in 1945, but Eleanor Roosevelt remained active. In 1945 she became a U.S. representative at the United Nations. There she worked to protect human rights. She also wrote books, magazine articles, and newspaper columns. She died in New York City on November 7, 1962.

Franklin D. Roosevelt served for 12 years as the 32nd president of the United States. He was elected four times beginning in 1932. Roosevelt led the

Franklin D. Roosevelt was the 32nd president of the United States.

country through two of the greatest crises of the 20th century: the Great Depression and World War II.

Early Life

Franklin Delano Roosevelt was born on January 30, 1882, in Hyde Park, New York. He was the only child of wealthy parents, James and Sara Delano Roosevelt. In 1900 he enrolled at Harvard University. While there he became engaged to Eleanor Roosevelt, a distant cousin and the niece of President Theodore Roosevelt. The couple married in 1905 and had six children. After graduating from Harvard, Franklin attended Columbia University Law School. He then worked as a clerk for a New York law firm.

Political Career

In 1910 Roosevelt was elected as a Democrat to the New York Senate. In 1912 President Woodrow Wilson made Roosevelt assistant secretary of the Navy. During World War I (1914–18) Roosevelt helped lead the Navy to victory over German sea forces. In 1920 Roosevelt ran for vice president, but the Democrats lost the election.

In 1921 Roosevelt caught poliomyelitis, a disease that paralyzed him from the waist down. In later years he could walk a little using a cane and leg braces, but he usually used a wheelchair.

In 1928 and again in 1930 Roosevelt was elected governor of New York. As the Great Depression began, Roosevelt introduced programs to help people without jobs.

TIMELINE

The United States enters World War II.

1932

Roosevelt launches the New Deal.

1933

Roosevelt dies in office.

1941

Roosevelt meets with British and Soviet leaders to plan the end of the war.

February 1945

April 12, 1945

Presidency

The Democratic Party chose Roosevelt to run for president in 1932. With the depression worsening, Roosevelt promised a “new deal” for millions of poor people. He won an easy victory over his Republican opponent, President Herbert Hoover.

By the time Roosevelt took office in March 1933, about 13 million people were unemployed in the United States. Roosevelt began his New Deal programs by making sure banks did not go out of business and by creating work for the jobless. In 1935 he asked Congress to pass the Social Security Act, which provided money to people who were unemployed, disabled, or elderly.

Roosevelt easily won reelection in 1936. By the time he began his second term in 1937, the economy had greatly improved. By 1938 the New Deal was coming to a close.

In 1939 World War II began in Europe. In a special session called by Roosevelt, Congress agreed to send weapons to Great Britain and France. In 1940 Roosevelt became the first U.S. president to run for and win a third term.

On December 7, 1941, Japan bombed a U.S. military base in Pearl Harbor, Hawaii. The surprise attack brought the United States into the war. It joined Britain against Japan, Germany, and Italy.

Roosevelt worked with British leader Winston Churchill to plan the war effort. Later, Soviet leader Joseph Stalin joined them. Roosevelt and other world leaders also began planning the United Nations, a new organization to maintain world peace. Roosevelt won election to a fourth term in 1944.

Death

On April 12, 1945, Roosevelt died while resting at his cottage in Warm Springs,

Georgia. Vice President Harry S. Truman became president. Within five months World War II ended.

Roosevelt, Theodore

Theodore Roosevelt was the 26th president of the United States. He took office after the assassination of President William McKinley in 1901. Roosevelt made the United States a strong presence in international affairs.

Early Life

Theodore Roosevelt was born in New York City on October 27, 1858. He was the second of four children born into a

Theodore Roosevelt was the 26th president of the United States.

wealthy family. Sickly as a boy, he later developed a strong body through exercise. He enjoyed hunting and ranching.

Roosevelt graduated from Harvard College in 1880. After briefly studying law, he won a seat in the New York legislature as a Republican.

In 1880 Roosevelt married Alice Hathaway Lee, with whom he had a daughter. His wife died in 1884, and in 1886 he married Edith Kermit Carow. They had five children.

Military and Political Career

In 1897 President McKinley made Roosevelt assistant secretary of the Navy. During the Spanish-American War in 1898 Roosevelt organized a unit of volunteer fighters. Known as the Rough Riders, the unit fought successfully in Cuba.

Roosevelt was a national hero after the war. He became governor of New York in 1898. In 1900 he won election as vice president under President McKinley. On September 14, 1901, McKinley died after being shot by an assassin. Roosevelt became president. In 1904 he won election to a full term.

Presidency

Roosevelt worked for peaceful relations between businesses and workers—a program he called the Square Deal. He also worked to prevent big companies from putting smaller companies out of business. Groups of big companies were called trusts, so Roosevelt became known as a “trust-buster.” Roosevelt also

TIMELINE

1898

Roosevelt pushes Congress to create the Forest Service.

1905

Roosevelt leaves office.

1909

Roosevelt runs for president with his new Progressive Party but loses.

1912

Roosevelt dies in New York.

January 6, 1919

asked Congress to pass acts against the sale of contaminated food and drugs.

In addition, Roosevelt wanted to protect the country's natural resources. He set aside lands as national forests, which then became off-limits to companies looking for lumber, minerals, or water. Congress created the Forest Service in 1905 to oversee the national forests.

In foreign affairs Roosevelt said his policy was to "speak softly and carry a big stick." He meant that the United States should deal fairly with other countries but also be ready to protect its interests. For example, in 1903 Roosevelt helped Panama gain independence from Colombia. In exchange, he demanded a piece of land. Afterward the United States began building the Panama Canal through that land.

Furthermore, Roosevelt expanded the Monroe Doctrine. In 1823 President

James Monroe had said that Europe should not become involved in the Americas. Roosevelt added that the United States would police the countries of Latin America to make sure they fulfilled their agreements with other countries.

Later Years

After leaving office in 1909, Roosevelt traveled to Africa and Europe. In 1912 he founded the Progressive Party and ran for president as its candidate. Both he and President William Howard Taft lost to the Democratic candidate, Woodrow Wilson. After that defeat Roosevelt wrote his autobiography and traveled to Brazil. Before Republicans could nominate him for president in 1920, Roosevelt died in New York on January 6, 1919.

Root

A root is a part of a plant that is usually hidden underground. Roots have several purposes. They hold the plant in the ground and keep it upright. They take water and food from the soil. They also store food for the plant.

There are two main kinds of roots: taproots and fibrous roots. A taproot is a long, thick root that points straight down. Smaller roots can grow out of its sides. Plants with taproots include carrots and dandelions. Fibrous roots are made up of many small roots, all about the same size. The small roots grow out in many directions from the base of the stem. Grasses have fibrous root systems.

Grass has fibrous roots. A sugar beet has a fleshy taproot.

Inside View of a Root

Each part of a root has a role in keeping the plant healthy.

A few plants can grow roots above-ground. Corn, for example, may grow roots out of its lower stem. Called aerial roots, they help to prop up the plant.

The end of a root is called the root tip. It makes new cells so that the root can grow. It has a cap that protects the root as it pushes through the soil. Above the root tip, on the outside of the root, root hairs take in water and nutrients. The water and nutrients move through a layer called the cortex on their way to the center of the root. The cortex also stores the plant's extra food. At the center of the root are tissues that carry water and food between the roots and the rest of the plant.

Damage to the roots will harm or kill a plant. If roots or root hairs are cut, the plant may not be able to get enough nutrients. Roots that dry out may never be able to absorb water again. If the soil is packed too tightly, roots cannot grow.

Rose

Roses are flowers with a rich scent.

There are about 100 species, or types, of rose plant. They belong to the rose family of plants, called Rosaceae. Most roses grown in gardens and sold by florists are hybrid tea roses.

Roses grow almost all over the world. The plants grow in the form of shrubs or vines. The stems usually have sharp thorns.

The flowers vary in color and size. They come in shades of pink, red, orange, yellow, and white. They may be from 0.5 inch (1.3 centimeters) to 7 inches (18 centimeters) across. Wild roses usually have five petals. Roses grown by people often have many sets of petals. The petals grow out from a fleshy, fruit-like structure known as a hip.

Roses make beautiful decorations. But roses have other uses besides being pretty. People use the fragrant oil from rose blossoms in perfumes. They also use

rose hips to make jams and herbal teas. Rose hips are a rich source of vitamin C.

Rosh Hashana

Rosh Hashana is the start of the religious new year for followers of Judaism. To Jewish people, it also marks the anniversary of the creation of the world. Rosh Hashana means “beginning of the

year” in the Hebrew language. Festive gatherings with family and friends are a tradition during this holiday. Also traditional are meals that feature sweet foods. The holiday is celebrated during the first two days of the Hebrew calendar month of Tishri. The holiday falls either in September or in early October. Rosh Hashana begins a 10-day period called the High Holy Days, or the Days of Awe, that ends on Yom Kippur.

Rosh Hashana is a joyous holiday, but it also is a serious one. Work is not allowed on the holiday. Most of the day is spent praying in the synagogue, the Jewish house of worship. The service at the synagogue includes the sounding of the shofar, a trumpet made of a ram’s horn. During Rosh Hashana people take time to review the mistakes they made in the past year. They also plan the changes they hope to make in the new year.

Ross, Betsy

Legend says that Betsy Ross sewed the first flag of the United States in 1776. The flag was known as the Stars and Stripes.

Elizabeth, or Betsy, Griscom was born on January 1, 1752, in Philadelphia, Pennsylvania. She attended a Quaker (a type of Christian) school. She married John Ross in 1773. The couple worked together in an upholstery business that he started. John died in 1776.

A painting shows Betsy Ross displaying the first U.S. flag to George Washington (left) and other patriots.

There is no solid proof that Betsy Ross sewed the first U.S. flag. But most people accept the following story as true. In 1776 a secret committee of three people, including George Washington, asked Ross to sew a flag. The flag was to have 13 stars and 13 stripes, to stand for the 13 American colonies. Ross suggested that the stars have five points instead of six, as Washington had chosen. She showed the men that it was easy to make a five-pointed star by folding a piece of cloth and making just one cut. Ross then made the flag at her house. Whether this story is true or false, in 1777 the United States accepted the Stars and Stripes as its new flag.

Ross married and then lost two more husbands. She continued with her upholstery business until she was 75. She died in Philadelphia on January 30, 1836.

Rubella

Rubella is a disease that is also known as German measles or three-day measles. A germ known as a virus causes rubella. The rubella virus passes from person to person through coughing and sneezing. The virus that causes rubella is not the same virus that causes regular measles.

Rubella is not usually a serious disease. However, pregnant women with rubella may pass the virus to their unborn children. Infected children may be born

The red rash of rubella can be seen on a person's arm.

with deafness, heart defects, vision problems, or other disabilities.

A rubella infection begins with a fever. The throat and the glands at the back of the neck may be sore. After one or two days a rash begins on the face and spreads downward. The spots of the rash are either pink or light red. The spots may be so close together that they look like patches. The rash lasts about three days.

Rubella is usually a mild illness that does not require medical treatment. Patients with rubella should rest and take pain medication if a doctor recommends it.

Scientists developed a vaccine for rubella in 1969. (A vaccine is a substance that prevents people from getting a certain disease.) Rubella is now rare in the United States. Most children get a vaccination that protects them against rubella, measles, and mumps.

Rudolph, Wilma

Wilma Rudolph was an outstanding athlete in track and field events. She was the first U.S. woman to win three gold medals in a single Olympics. People called her the world's fastest woman.

Wilma Glodean Rudolph was born on June 23, 1940, near Clarksville, Tennessee. As a child Wilma had many illnesses, including polio. This disease made her unable to walk without a leg

Rug and Carpet

Rugs and carpets are thick textiles, or pieces of cloth, that people use as floor coverings. They are often decorative as well as useful. The term rug usually means a floor covering that is not fastened down and does not cover the entire floor. Carpet usually means a floor covering that is fastened down and covers the entire floor.

Most rugs and carpets are made by weaving together two sets of yarn. One set stretches from top to bottom. The other set goes from side to side. The yarn is made of wool, nylon, or other fibers. Many rugs and carpets have a raised surface called pile. The pile may be made of loops of yarn. Or it may be made of strands of yarn that stick up from the carpet backing. Flat-woven rugs have intersecting strands of yarn but no pile.

Today many rugs and carpets are made on machines that can produce them quickly and inexpensively. But for thou-

Colorful rugs line the walls and floor of a tent in Kazakhstan.

Wilma Rudolph wins the women's 100-meter dash in the 1960 Olympics.

brace or a special shoe. By age 12, however, she could walk normally.

Rudolph became a graceful yet powerful sprinter. She won a bronze medal at the 1956 Olympics. She won her three gold medals at the 1960 Olympics. She set world records in the 100- and 200-meter dashes and in the 4 × 100-meter relay.

After these victories Rudolph's hometown of Clarksville planned a welcome-home parade for her. Rudolph, who was African American, refused to participate unless blacks and whites could attend the event together. This was the first time that both races had gathered together in Clarksville.

Rudolph retired from running in 1962. She later became a track coach and a national sports commentator. She died on November 12, 1994, in Brentwood, Tennessee.

sands of years people have woven beautiful rugs and carpets by hand.

Some of the best-known and most expensive handmade floor coverings are called Oriental rugs. They are made in such Asian countries as Iran, Turkey, China, and Azerbaijan. Many Oriental rugs are made by Muslims, who kneel on rugs when they pray.

There are many different designs of Oriental rugs. Some rugs have simple, brightly colored patterns with stars, squares, and other shapes. Other rugs have more complicated designs showing people, animals, and flowers.

Rugby

Rugby is a ball game that is played on a grassy field. Two teams try to move the ball down the field into the opponent's goal. Players score points by carrying the ball across the goal line or by kicking it

between goalposts. The team that scores more points wins.

Rugby was invented in England in the 1800s. Today it is played throughout the world. It is most popular in Great Britain, Australia, New Zealand, and South Africa.

Playing Field and Equipment

A rugby field is rectangular. Each end of the field has a goal line. Touchlines run along the sides of the field. Most of the game takes place between the goal lines and the touchlines. This playing area is no more than 230 feet (70 meters) wide and 328 feet (100 meters) long. Behind each goal line is an area called the “in goal.” At the center of each goal line stand two goalposts that are 18.3 feet (5.6 meters) apart. The goalposts are connected by a crossbar that is 10 feet (3 meters) above the ground. The goalposts and the crossbar form an H shape.

A rugby ball is oval and filled with air. It is about 11 inches (28 centimeters) long. Though rugby is a rough game, players usually do not wear helmets or pads. However, players do sometimes wear mouth guards. They also may protect their ears by taping them down.

Playing the Game

There are two versions of rugby. In one version, called Rugby Union, two 15-member teams compete. In the other version, called Rugby League, the teams have 13 members.

A rugby game usually has two 40-minute halves. There are no time-

The goal lines at each end and the touchlines along the sides outline the main playing area of a rugby field.

outs, and play rarely stops. The game starts with a kickoff—one team kicks the ball to the other team. The two teams then move up and down the field as they gain and lose control of the ball.

The players may catch the ball, throw it, or run with it. Teammates may pass the ball to each other either sideways or backwards. They may not pass the ball forward. Players may also kick the ball.

The two ways of scoring points in rugby are called tries and goals. A player scores a try by touching the ball to the ground behind the opponent's goal line. A player scores a goal by kicking the ball over the crossbar between the opponent's goalposts.

After a try, the scoring team can kick a type of goal called a conversion goal. During play, a player scores a dropped goal by dropping the ball and kicking it after it bounces. A team can score a penalty goal after the other team breaks the rules.

Rugby Union and Rugby League award different numbers of points for tries and goals. In both versions, however, a try is worth more points than a goal.

As in American football, the team defending its goal tries to tackle the opponent who is carrying the ball. One type of tackle forces the player to the ground. Another type happens when the player is stopped and held motionless.

The scrum, or scrummage, is a unique feature of rugby. It is a way to put the

Players in a scrum struggle for the ball.

ball in play. Six or eight players from each team link their arms and bend forward to form a tightly packed group. The ball is dropped between the two teams. The players use their feet to try to get control of the ball.

History

According to legend, rugby began at Rugby School in England in 1823. During a soccer game, a student named William Webb Ellis picked up the ball with his hands and ran with it. This went against the rules of soccer, which ban the use of the hands. But it led to the creation of rugby.

A group of English teams formed the Rugby Football Union (RFU) in 1871. The RFU wrote rules for the game. In 1895 more than 20 teams left the RFU. They set their own rules. The league they created is now known as the Rugby Football League. The different versions of the game came to be known as Rugby Union and Rugby League.

Did You Know?

The ancient game called harpastum is like rugby. Romans introduced it to Great Britain in about AD 400.

Russia

Russia has been a powerful country throughout its history. In the 1900s it was the center of the Union of Soviet Socialist Republics. Today Russia is the largest country in the world. The capital of Russia is Moscow.

Geography

Russia stretches from eastern Europe to the Pacific Ocean. On the west Russia borders the Baltic Sea, Norway, Finland, Estonia, Latvia, Belarus, and Ukraine. The small Russian province of Kaliningrad lies apart from the rest of Russia, between Lithuania and Poland. To the southwest of Russia are the Black and Caspian seas, Georgia, and Azerbaijan. South of Russia are Kazakhstan, Mongolia, China, and North Korea. The Arctic Ocean lies to the north. Several large islands in the Arctic and Pacific oceans also belong to Russia.

Russia lies partly in Europe and partly in Asia. The low Ural Mountains are the dividing line. European Russia is a broad plain with scattered hills. South of the plain are the Caucasus Mountains. Asian Russia contains the large region called Siberia. Siberia includes a plain and a plateau, or area of flat, raised land. Northeastern Russia has mountain chains and volcanoes.

The most important river in European Russia is the Volga. Many other rivers run through Siberia. In general, Russia has warm summers and very cold, snowy winters.

Plants and Animals

A treeless region called tundra lies along Russia's northern coast. Only mosses, lichens, and grasses grow in the tundra. South of the tundra is the taiga, an area

of evergreen forests. The taiga stretches across most of Siberia. In European Russia there are forests of ash, spruce, hazel, oak, and other trees. An area of grassland, called the steppe, covers southern Russia.

Animals in the tundra include reindeer, Arctic foxes, and musk oxen. The taiga is home to sables, squirrels, foxes, elk, and bears. Marmots, skunks, and wolves are common on the steppe.

Winter weather is severe in many parts of Russia.

People

About 80 percent of the people are Russians. The largest minority groups are the Tatars and the Ukrainians. Most of the population speaks Russian. Most people live in cities. Moscow is the largest city by far.

About one third of the people follow no religion. About half of the people are Eastern Orthodox Christians. There are smaller groups of Muslims, Protestants, and Jews.

Most of Russia's people live in cities. But small towns and farms can be found throughout the country.

Economy

Most Russian workers work in services, including banking, science and technology, education, and transportation. International trade is also a large part of the economy.

Russia's factories produce metals, machinery, cement, chemicals, motor vehicles, military equipment, and other goods. Russia is also a top producer of coal, oil, and natural gas. Its mines provide iron ore, copper, nickel, zinc, and other minerals. The large forests supply wood.

Farmers in Russia grow mainly grains, including wheat, barley, rye, and oats. Other crops include potatoes, sugar beets, corn, and sunflower seeds. Cattle, pigs, and sheep are the main livestock. Fishing is another important source of food.

History

People have lived in what is now Russia for thousands of years. The East Slavs

settled in the southwest by the AD 300s. They came from eastern Europe.

By the 800s people from Scandinavia (Denmark, Sweden, and Norway) had entered the territory of the East Slavs. These Scandinavians are known as Varangians. The Varangians mixed with the Slavs and gave them the name Rus. The name Russia came from that name.

The town of Kiev was the capital of the territory, which became known as Kievan Rus. Kievan Rus grew to be the largest state in Europe.

The Mongols and Muscovy

In the 1200s warriors from central Asia known as Mongols, or Tatars, invaded Kievan Rus. The Mongols set up a kingdom called the Golden Horde. During the time of Mongol rule, two strong Russian states developed. Novgorod became a powerful state in western Russia. Muscovy, or Moscow, became the strongest power in the north.

In 1478 the ruler of Muscovy, Ivan III (also called Ivan the Great) conquered Novgorod. Two years later he defeated the Mongols and made the Russian lands independent. Ivan IV came to the throne in 1533. He called himself tsar (emperor) of all Russia. Ivan IV earned the title Ivan the Terrible because of his cruel and violent rule.

The Romanov Dynasty

In 1613 Michael Romanov became tsar. His family ruled Russia until 1917. Under the Romanovs, Russia became one of the most powerful states in Europe.

Peter I, called Peter the Great, became tsar in 1682. Peter added to Russia's territory and built a new capital, which he named Saint Petersburg. Catherine II, called Catherine the Great, came to the throne in 1762. She also expanded Russia. Nicholas II, who became tsar in 1894, was the last of the Romanov rulers.

TIMELINE

The Mongols invade Kievan Rus.

1200s

Michael Romanov becomes tsar of Russia.

1613

Russia becomes part of the Soviet Union.

1922

Yeltsin resigns as president; Vladimir Putin becomes the next president.

1999

Ivan III ends Mongol rule.

1480

The Russian Revolution overthrows the tsar.

1917

The U.S.S.R. collapses; Boris Yeltsin becomes president of an independent Russia.

1991

Catherine the Great ruled Russia from 1762 to 1796.

The Russian Revolution

In 1914 Russia entered World War I. After three years of terrible losses, the Russian people rebelled against the tsar in March 1917. Nicholas II stepped down, and the country set up a temporary government. Nicholas was later executed.

In November 1917 a group called the Bolsheviks seized control of Russia. Led by Vladimir Lenin, the Bolsheviks set up a Communist government. The new government took Russia out of World War I.

The Soviet Union

Some Russians fought a civil war against the Bolsheviks, but the Bolsheviks defeated them. In 1922 the Bolsheviks set up a new country called the Union of Soviet Socialist Republics, or the Soviet Union. Russia was the largest of the new

country's republics, or states. The Communist government of the Soviet Union ruled harshly at times. Millions of people died during the rule of Soviet leader Joseph Stalin.

By the 1980s many people in the Soviet Union wanted more freedom and a better economy. A leader named Mikhail Gorbachev tried to institute some reforms. But the Communist government could not solve the country's problems. In 1991 the Soviet Union collapsed. Each of the 15 republics that had made up the Soviet Union became an independent country.

A New Russia

The first leader of the newly independent Russia was Boris Yeltsin. His government gave the people more rights and freedoms. However, the government also faced a poor economy and a number of revolts. One of those revolts took place in the southwestern region called Chechnya. Some people in the region wanted independence from Russia. Chechen rebels carried out several deadly attacks in Russia.

Yeltsin retired in 1999. His successor continued to face problems with the economy and with the rebellion in Chechnya into the 21st century.

Russian Revolution

Centuries of harsh rule under the tsars, or emperors, of Russia came to an end with the Russian Revolution of 1917. The revolution took place in two stages. In the end, it gave the Russian people an entirely new form of government.

Background

The common people of Russia had few rights under the tsars. They protested this situation in 1905. Afterward, Tsar Nicholas II created a lawmaking body called the Duma. The Duma was supposed to give some of the citizens a say in the government. However, the tsar still held most of the power.

February Revolution

By 1917, Russia faced several challenges. The country was fighting Germany in World War I (1914–18). Russia was also short of food and fuel for the cold winter. In the capital city of Petrograd (now Saint Petersburg), angry people pro-

tested the hard conditions. The army joined the protesters instead of stopping them. Tsar Nicholas II had to give up all power. This was called the February Revolution.

A committee of the Duma appointed a temporary government to replace the tsar. This government was unable to solve Russia's problems. A group of workers and soldiers rose to challenge the government. The group was called the Petrograd Soviet.

Other soviets soon appeared in other cities. As the government grew weaker, the soviets grew stronger. Several different political parties fought for control of the soviets. Eventually, the party called the Bolsheviks came out on top. Vladimir Lenin led the Bolsheviks.

October Revolution

In October 1917 the Bolsheviks took over the government. Soon a new government was formed, with Lenin as its leader. The Bolsheviks believed in Communism. They thought that all the common working people should share in the wealth of the country. They did not believe that individuals should be able to own land on their own. They took away everything that the tsar's family had owned. They also improved conditions for workers.

Civil War

Lenin made peace with Germany in March 1918. In the process, he had to give up much of Russia's territory. This made many Russians unhappy. Some of them started a civil war.

Protesters gather outside the tsar's palace in Petrograd (now Saint Petersburg) in 1917.

The armies that fought the war were called the Reds and the Whites. The Reds represented the Russian Communists, as the Bolsheviks called themselves after March 1918. The Whites represented other groups that wanted to control the country. During the war the Communists killed the tsar and his family. The Communists won the war in November 1920. In 1922 they gave the country a new name—the Union of Soviet Socialist Republics.

Ruth, Babe

Babe Ruth is probably the most famous player in baseball history. He set or tied about 60 records during his long major league career.

Early Life

George Herman Ruth was born in Baltimore, in the U.S. state of Maryland, on February 6, 1895. He spent much of his childhood getting into trouble on the streets. At age 7 his parents placed him in Saint Mary's Industrial School, which took in troubled youth. There he learned to play baseball.

Career

Ruth began his career in 1914 as a pitcher for Baltimore's minor league team. It was then that he got the nickname Babe. Later in 1914 he joined the Boston Red Sox. Ruth pitched for Bos-

Babe Ruth

ton in the World Series in 1916 and 1918. He also became a powerful batter. In 1918 the team moved him to the outfield so he could play in every game.

In 1920 the Red Sox sold Ruth to the New York Yankees. Ruth played his best seasons with the Yankees. He led the American League in home runs for 12 years. In 1927 he hit 60 home runs. This was a season record that was not broken until 1961.

Ruth played 22 major league seasons and starred in 10 World Series. His lifetime record of 714 home runs stood until Hank Aaron broke it in 1974.

Retirement

Ruth played his last season for the Boston Braves in 1935. In 1936 he was elected to the Baseball Hall of Fame. Ruth died in New York City on August 16, 1948.

Babe Ruth was known as the Sultan of Swat.

Rwanda

Rwanda is a small, mountainous country in east-central Africa. The capital is Kigali.

Rwanda borders the Democratic Republic of the Congo, Uganda, Tanzania, and Burundi. Lake Kivu forms part of Rwanda's western border. Mountains, hills, and deep valleys cover the land.

Rwanda has bamboo forests, wooded regions, and grasslands. Its wildlife includes elephants, chimpanzees, antelopes, zebras, hippopotamuses, and buffalo. Rare mountain gorillas live in Rwanda's Virunga Mountains.

Women carry baskets on their heads in Rwanda.

Most Rwandans are farmers who produce food for their own families. The major food crops are plantains, sweet potatoes, cassava, potatoes, sorghum, and corn. Cattle and goats are the main livestock. Rwandans also grow coffee and tea to sell to other countries.

The first people to live in Rwanda were the Twa. The Hutu arrived next. The Tutsi appeared in the 1300s and conquered the Hutu. Germany and then Belgium controlled Rwanda from the late 1800s. In 1962 Rwanda became independent under Hutu leaders.

Tutsi rebels began a civil war in 1990. In 1994 Hutu forces killed at least 500,000 people, mostly Tutsi. The Tutsi rebels managed to take control of Rwanda, however. They set up a government with both Tutsi and Hutu representatives.

Rye

Rye is a grain that grows well in poor soils and harsh climates. Grains are grasses that produce seeds that can be eaten. Poland, Russia, and Germany are major rye-producing countries. The scientific name for rye is *Secale cereale*.

A rye plant grows to about 4 to 6 feet (1 to 2 meters) tall. It has a round, hollow stem and long, narrow leaves. The leaves are blue-green and have a coarse texture. At the end of the stem is a slender structure called a spike, which holds the seeds. A rye spike is about 3 to 6 inches (7.6 to 15 centimeters) long. There are two or more rows of seeds on each spike.

People grind rye seeds to make flour. Rye flour is used to make bread and crackers. It is often mixed with wheat flour.

Rye grows in colder regions than most other grasses that are used for food.

Women in Albania cut and thresh, or remove the seeds from, rye plants.

Farmers feed rye to livestock. They also use rye plants to make tough straw. Rye straw is used as bedding for farm animals. It is used in mattresses, hats, and paper, too.

A poisonous fungus called ergot sometimes attacks rye plants. Ergot forms hard, black masses on rye plants that may look like grains. People or animals may become ill or even die after eating rye with ergot in it. Ergot poisoning can cause hallucinations (seeing things that are not there), vomiting, and shaking.

Many people throughout history have observed the effects of ergot on humans and animals. Some experts think that the people accused of being witches during the Salem witch trials of 1692 may have had ergot poisoning. Today, foods made with rye that are sold in stores rarely contain ergot. Scientists have even found a way to use chemicals in ergot to make certain medicines.

(See Skiing.)

Sacagawea

Sacagawea was a member of the Shoshone Native American tribe. She helped Meriwether Lewis and William Clark explore parts of the western United States from 1804 to 1806. She traveled thousands of miles in the wilderness on the group's journey to the Pacific Ocean.

Early Life

Sacagawea was born in about 1786 in what is now Idaho or Montana. When Sacagawea was about 10 or 12 years old, a group of Hidatsa Native Americans captured her. They took her to what is now North Dakota. In about 1804 Sacagawea became the wife of a French Canadian fur trapper named Toussaint Charbonneau.

Expedition

In 1803 President Thomas Jefferson organized an expedition to explore the territory between the Missouri River and the Pacific Ocean. Meriwether Lewis and William Clark headed the expedition. They arrived near what is now Bismarck, North Dakota, in the fall of 1804. They spent the winter among the Mandan tribe of Native Americans.

During this time Lewis and Clark hired Charbonneau as a guide. Sacagawea joined the expedition as well. On February 11, 1805, Sacagawea gave birth to a baby boy, Jean-Baptiste. When the expedition set out on April 7, Sacagawea carried her infant son on her back.

Sacagawea guided Lewis and Clark on their expedition of 1804–06.

Sacagawea identified plants for the explorers. She also searched for fruits and vegetables that they could eat. In addition, her presence showed other Native Americans that the group came in peace. Many tribes believed that a woman with an infant would travel only with a peaceful group.

In August 1805 the expedition met some Shoshone in what is now Montana. The chief of these Shoshone was Sacagawea's brother, Cameahwait. He gave the expedition horses and guides to help them on their journey.

Charbonneau and Sacagawea went all the way to the Pacific coast with the expedition. Sacagawea may have died several years after the return journey, in 1812. But some stories say that she rejoined the Shoshone in Wyoming and lived until 1884.

Sacramento

Sacramento is the capital of the U.S. state of California. The city was the center of activity during a gold rush in the mid-1800s. It lies where the American and Sacramento rivers meet. A shipping canal links Sacramento to the San Francisco Bay.

Many people in Sacramento work for the government or in health care, trade, or other service industries. Food processing, construction, and printing are among the leading industries.

In 1839 a man named John Augustus Sutter established a settlement that later

became Sacramento. In 1848 gold was discovered on Sutter's land. Thousands of people moved to the area to look for gold. Sutter's son soon laid out Sacramento. The city became the supply center for the gold seekers.

In 1854 Sacramento became the capital of California. Gold mining later declined in the area. But Sacramento continued to grow as a center of government, food processing, and shipping.

Sadat, Anwar el-

Anwar el-Sadat was the president of Egypt from 1970 until 1981. He is remembered for trying to make peace with Israel.

Muhammad Anwar el-Sadat was born in Egypt on December 25, 1918. He graduated from the Cairo Military Academy in 1938. In 1950 Sadat joined a group of military officers led by Gamal Abdel Nasser. In 1952 Nasser's group removed the king of Egypt from power. Nasser became president. In 1964 Sadat became vice president under Nasser. He was elected president soon after Nasser's death in 1970.

As president Sadat had to deal with Egypt's long-standing conflict with Israel. Many Arabs in Egypt and other countries believed that Israel was their enemy. Some thought that Israel should not even be a country. In 1967 Israel had taken control of a piece of Egyptian

The California state Capitol is in a park in the heart of Sacramento.

Anwar el-Sadat

land called the Sinai Peninsula. In October 1973 Sadat led Egypt into war with Israeli soldiers on the peninsula. Israel was able to hold onto the land. But Sadat gained respect among Arabs.

Sadat's actions toward Israel soon changed. In 1977 he made a historic visit to the country. He said that Israel had a right to exist and offered to make peace. Later he took part in peace talks with Menachem Begin, Israel's leader. Sadat and Begin shared the Nobel peace prize in 1978. The next year Egypt and Israel signed a peace treaty. It was the first peace treaty between Israel and an Arab country.

Many Arabs hated Sadat for making peace with Israel. They still believed that Israel was their enemy. A group of Egyptian soldiers shot and killed Sadat in Cairo on October 6, 1981.

Saddam Hussein

Saddam Hussein took power as president of Iraq in 1979. He ruled as a brutal dictator, or leader with unlimited power, until 2003.

Early Life

Saddam Hussein al-Tikriti was born on April 28, 1937, in a village near Tikrit in northern Iraq. He joined the Ba'th Party, a revolutionary political group, in 1957. Two years later, Saddam participated in a plot to kill Iraq's prime minister (head of government). When the government discovered the plot, he fled to Egypt.

Presidency

Saddam returned to Iraq in 1963. He joined the Ba'th government, which had seized power. The Ba'th government lost control later that year. But the Ba'th Party, including Saddam, returned to power in 1968. In 1979 Saddam forced

A special court was created for Saddam Hussein's trial. He was accused of several crimes, including crimes against humanity.

Iraq's president to retire. He then took the job for himself.

As president, Saddam became extremely rich and built a powerful military to serve him. Those who did not agree with Saddam's government paid a heavy price. They were often jailed or murdered.

Despite these acts, many Arabs in the Middle East admired Saddam. They liked that he spoke out against the power of the United States and Europe.

In 1980 Saddam attacked Iran. This led to the Iran-Iraq War, which lasted until 1988. In 1990 Saddam invaded Kuwait. The Persian Gulf War began in 1991 as a result. During the war, the United States and its allies drove Saddam's forces out of Kuwait.

Capture and Trial

By 2003 the United States and other countries feared that Saddam was building illegal weapons and supporting terrorism. U.S. and British forces invaded Iraq that year, but Saddam escaped. Months later, U.S. soldiers found and captured him. In 2005 Saddam went on trial for his crimes. He was accused of playing a role in the deaths of more than 100 people in Iraq in the 1980s. In 2006 he was found guilty and sentenced to death. He was executed on December 30, 2006.

Special seats and seat belts help keep children safe while riding in cars.

Safety

Safety is anything that people do to protect themselves or others from harmful accidents. People can prevent accidents by following safety measures. Governments pass laws to keep people safe. For example, a law could require that buildings have clearly marked exits. This would allow people to escape quickly during a fire. Laws and other rules that are meant to protect all people are called public safety measures.

Another way to promote public safety is to spread information about safety measures. For example, magazines about parenting often have articles on how to keep a house safe for children. These articles may recommend keeping cleaning products out of reach or covering electrical outlets.

Workplaces also have rules that are designed to keep workers safe. These are called occupational safety measures. For example, factories may require employ-

ees to wear a helmet or safety goggles to protect themselves from injury.

Sahara

The Sahara is the largest desert on Earth. It covers about 3,320,000 square miles (8,600,000 square kilometers) in northern Africa. The Sahara includes at least part of 10 countries—Morocco, Algeria, Tunisia, Libya, Egypt, Mauritania, Mali, Niger, Chad, and Sudan—plus the territory of Western Sahara.

The Sahara is the hottest region in the world during the day in summer. Temperatures above 120° F (49° C) are common. The air becomes much cooler when the sun sets. Rain is very rare. When rain does fall, it often comes in powerful storms.

Features

Much of the Sahara's surface is rocky. There are flat plains and raised land

called plateaus. There are also some mountains. Sand covers only about one quarter of the Sahara. In some places the sand is piled high in hills called dunes.

The Nile and the Niger rivers cross the edges of the Sahara. No other streams flow year-round. Dry streambeds, called wadis, fill with water only when it rains.

In some places there is a supply of underground water. These places are called oases. The water comes to the surface through openings called springs. People also dig wells to get underground water.

Plants and Animals

Many of the Sahara's plants and animals depend on the water found at oases. Shrubs, rough grasses, and palm trees make up much of the region's plant life. Olive, cypress, and acacia trees grow in the highlands. Animals of the desert include gerbils, hedgehogs, gazelles, baboons, hyenas, and foxes. Scorpions and snakes are common.

Palm trees grow in an oasis of the Sahara in the country of Algeria.

People

Some people of the Sahara are nomads. They raise camels, sheep, and goats. They roam from place to place in search of grass for their animals to eat. Today, however, most of the people of the Sahara stay in one place, mostly near oases. They grow fruit, especially dates, and grains such as millet, barley, and wheat. People trade animal skins, wool, fruits, and salt in oasis villages.

Saint

A saint is a person who is believed to be especially close to God. Some saints are prophets, or messengers of God. Others are healers, doers of good deeds, or martyrs. A martyr is someone who is killed for belonging to a religion. Sainthood is an official status in some religions. In other religions people become saints simply because many people honor them.

Saints are venerated—honored with special acts of devotion—in two of the three branches of Christianity. In Roman Catholicism and Eastern Orthodoxy a person can be declared a saint after his or her death. Roman Catholics and Eastern Orthodox Christians believe that saints have special powers to help people. They venerate the remains of the saints and certain objects associated with the saints. They also honor each saint with a special feast day. Most Protestants do not venerate saints.

Stained-glass windows in many Roman Catholic churches have images of saints, such as Saint Dominic.

Muhammad, the great prophet of Islam, said that there are no saints. But Muslims do honor certain holy people who they believe are especially close to God. These holy people are thought to have special powers to bless people and to perform miracles. Such a person is known as *wali*, meaning “friend of God.” Muslims also honor martyrs.

All Buddhists honor saints, which include the Buddha himself. Buddhists believe in a cycle of birth, death, and rebirth; after death, one’s soul is reborn in another being. In general, Buddhists honor as saints people who have freed themselves from this cycle of rebirth and those who have helped others free themselves from the cycle.

Hinduism recognizes a great variety of saints, including sadhus and avatars. Sadhus are holy people who go without

nearly everything except what they need to survive, such as a little food and a few simple belongings. An avatar is believed to be a god reborn into human or animal form.

Saint Augustine

Saint Augustine is a city in northeastern Florida, near the Atlantic Ocean. Settled in 1565, it is the oldest city in the United States. It was named for the Catholic leader Saint Augustine of Hippo.

Saint Augustine has kept many historical features. Many buildings still look like they did when Spain ruled Florida as a colony hundreds of years ago. The Spanish fortress Castillo de San Marcos is a national monument. It is the oldest fort in the country.

A photograph taken from above shows the Castillo de San Marcos. The Spanish built the stone fort in Saint Augustine, Florida, between 1672 and 1695.

Saint Augustine's main industry is tourism. Many people hold jobs in hotels and other places serving vacationers. The city also depends on fishing and shipbuilding.

In 1513 the Spanish explorer Juan Ponce de León landed near what is now Saint Augustine. He claimed the land for Spain. Another Spanish explorer, Pedro Menéndez de Avilés, founded Saint Augustine in 1565. In 1819 Spain gave Florida to the United States.

Saint George's

Population
(2004 estimate), town, 4,300; (2001 estimate), urban area, 35,560

Saint George's is the capital of Grenada, an island country in the eastern part of the Caribbean Sea. It lies on the island's southwestern coast. It surrounds a deep, scenic harbor called the Carenage.

Saint George's is Grenada's main port and center of trade. Shipping goods through the port is important to the town's economy. Tourism also brings money to the town. The sites include two forts from the 1700s and the Grenada National Museum. Saint

A sailing ship finds shelter in the harbor of Saint George's, Grenada.

George's also has a university that specializes in medical education.

French settlers founded Saint George's in 1650. Great Britain took over Grenada in the late 1700s. From 1885 to 1958 Saint George's was the capital of the British Windward Islands, a group of islands that were a British colony. In 1974 Grenada became an independent country. Saint George's was its capital.

Fighting took place in Saint George's when U.S. troops invaded Grenada in 1983. Hurricanes caused great damage to the town in 2004 and 2005.

Saint John's

Population
(2004 estimate)
23,600

Saint John's is the capital of Antigua and Barbuda, an island country in the Caribbean Sea. The city lies on the coast of the island of Antigua. It is the country's largest city, main port, and business center. It is also a popular vacation spot.

The main landmark in Saint John's is Saint John's Cathedral. First built in 1681, it was rebuilt in the 1840s after suffering earthquake damage. Other attractions include Fort James, from the 1700s, and the Museum of Antigua and Barbuda.

Tourism is the main industry in Saint John's. Banking and shipping goods through the port also bring money to the city.

British settlers founded Saint John's as a colony in 1632. The city had to be rebuilt after severe earthquakes occurred in 1690 and 1843. A fire in 1769 and a hurricane in 1847 also damaged the city. In 1981 Antigua and Barbuda became an independent country with Saint John's as its capital.

Antigua and Barbuda

Saint Kitts and Nevis

Saint Kitts and Nevis is a country of two small islands in the eastern Caribbean Sea. The capital and largest city is Basseterre.

Geography

Saint Kitts, sometimes called Saint Christopher, is about twice the size of Nevis. Nevis lies to the southeast of Saint Kitts. The islands are part of the region called the West Indies.

An inactive volcano rises on Saint Kitts. A mountain forms almost all of Nevis' land. Saint Kitts has beaches of black sand, while Nevis' sand is white. Both islands have hot, tropical weather.

People

Most of the country's people have black African ancestors. There are also small groups of Asians and whites. Most of the population is Christian. English is the main language. Most people live in the countryside.

Economy

The economy depends on tourism, banking, and the sale of sugar. The sugar is made from sugarcane, which grows all over Saint Kitts. Farmers on Nevis grow mostly cotton, vegetables, and coconuts. Manufacturers on the islands make electronics, beverages, and clothing.

History

The first people on the islands were American Indians. Christopher Columbus visited the islands in 1493. The English settled on both islands in the early 1600s. They brought in Africans to work as slaves on sugar plantations.

The English and the French fought over the islands until the 1780s. Then the English officially took control. In 1882 Great Britain combined Saint Kitts, Nevis, and the island of Anguilla into one colony. Anguilla broke away in 1971. Saint Kitts and Nevis became an independent country in 1983. In 1998 Nevis voted against separating from Saint Kitts.

Saint Lawrence River and Seaway

The Saint Lawrence Seaway connects the Great Lakes to the Atlantic Ocean in eastern North America. The Saint Lawrence River is just one part of the long seaway system. The seaway allows ships from the ocean to reach the industrial and farming regions around the Great Lakes. This makes the system very important to the economies of both the United States and Canada.

The Saint Lawrence Seaway is about 2,340 miles (3,770 kilometers) long. At its western end is the city of Duluth, Minnesota. Duluth is a port on Lake Superior, one of the five Great Lakes. Narrow waterways link the lakes to one another. The Saint Lawrence River itself begins at the eastern end of Lake Ontario. It flows 740 miles (1,190 kilometers) to the Gulf of Saint Lawrence. Finally, the Cabot Strait connects the gulf to the Atlantic Ocean.

French explorer Jacques Cartier was the first European to sail into the Saint Lawrence River. He could not travel

very far into the continent by river, however. The way was blocked by a stretch of rapids. Later explorers discovered other natural barriers to sailing through the Great Lakes.

Over the years people built canals, locks, and dams to get around some of these barriers. Canals are waterways built to connect two natural bodies of water. Locks are structures that raise or lower a ship from one water level to another. They are needed where the water level varies between different bodies of water.

Some barriers remained, however. Finally in 1954 the governments of the United States and Canada agreed to build the Saint Lawrence Seaway. The construction took nearly five years. In addition to building locks and canals, workers deepened several waterways. The seaway opened to ships in 1959.

Saint Patrick's Day

Saint Patrick's Day is a popular holiday celebrated on March 17. The holiday honors Saint Patrick, the man who brought Christianity to Ireland. Saint Patrick's Day is a national holiday in Ireland. Yet people in other countries enjoy the holiday, too.

Irish Americans march in New York City's Saint Patrick's Day parade.

How Saint Patrick's Day Is Celebrated

Many people celebrate Saint Patrick's Day by wearing green clothing or shamrocks (three-leafed clovers). Green and shamrocks are symbols of Ireland.

Many U.S. cities with large Irish populations have huge public celebrations. Boston held its first Saint Patrick's Day celebration in 1737. In the 1760s New York City began the tradition of holding

a parade for the occasion. Chicago dyes its river green for the day.

History

Saint Patrick was born in Britain in the late 300s or early 400s. Pirates captured him when he was 16. They sold him as a slave in Ireland, where he worked as a shepherd for six years. He then escaped and returned home.

After years of religious training, Patrick went back to Ireland. There he converted many people to Christianity. The year of his death is unknown.

There are several legends about Saint Patrick. One legend says that he drove away all the snakes in Ireland. Another legend says that he used the three parts of a shamrock leaf to explain the idea of the Trinity. The Trinity refers to the Father, Son, and Holy Spirit in the Christian religion.

(2007 estimate)
277,251

Saint Paul is the capital of the U.S. state of Minnesota. It lies along a deep bend of the Mississippi River. The city of

The Cathedral of Saint Paul is the most important Roman Catholic church in Saint Paul, Minnesota.

Minneapolis is located just across the river. Together Saint Paul and Minneapolis are called the Twin Cities.

Saint Paul is a major center of industry, banking, and insurance. Factories in and around the city make cars, electronics, computers, and many other products. Other factories process oil and foods.

Hundreds of years ago the Dakota Indians (a division of the Sioux people) were living in the Saint Paul region. A French-Canadian trader named Pierre Parrant established a settlement there in 1838. The settlement was called Pig's Eye, which was Parrant's nickname. A log chapel dedicated to the Christian saint Paul was built in Pig's Eye in 1838. After that the town was called Saint Paul.

In 1849 Saint Paul became the capital of the Minnesota Territory. In 1858 Minnesota became a U.S. state with Saint Paul as its capital.

Saint Petersburg

Population
(2006 estimate)
4,580,620

Saint Petersburg is the second largest city in Russia, after Moscow. The city lies on the Neva River where it flows into the Baltic Sea. It spreads over a mainland section and more than 40 islands. Saint Petersburg was Russia's capital for 200 years. Today it is an important center of industry, education, science, and culture.

Places of Interest

Saint Petersburg is famous for its beauty and its many historic buildings. The huge gold dome of Saint Isaac's Cathedral can be seen from throughout the city. Many of Russia's former rulers, called tsars, are buried in the Cathedral of Saints Peter and Paul. The city's Winter Palace was home to the tsars from 1762 until 1917.

Saint Petersburg is a great cultural center known for its ballet, music, and theater. The city's Hermitage and State Russian museums have large, important collections of art.

Economy

Saint Petersburg is a major seaport and industrial center. Factories in the city make such products as machinery, metals, foods and drinks, and paper. Many people in the city work in services such as trade, education, and health care.

History

The Russian tsar Peter the Great founded Saint Petersburg in 1703. The city grew rapidly. It became the capital of Russia in 1712.

By the late 1800s Saint Petersburg had many factories, as well as many poor workers. In 1905 government troops shot people who were protesting poor working conditions. This event became known as Bloody Sunday. It led people to try to overthrow Russia's government. In 1917 the city was a center of the revolution that forced the tsar from power.

The leader of that revolution was named Lenin. For much of the 1900s Saint Petersburg was called Leningrad in his honor.

In 1918 the Russian capital was moved to Moscow. Russia soon became part of a Communist country called the Soviet Union.

German soldiers surrounded Leningrad from 1941 until 1944, during World War II. More than half a million people in the city died from bombings, hunger, and disease. Leningrad was later rebuilt.

In 1991 the Soviet Union fell apart, and Russia became a separate country again. Leningrad's name was changed back to Saint Petersburg.

Saint Vincent and the Grenadines

Saint Vincent and the Grenadines is an island country in the Caribbean Sea. It is part of the region called the West Indies. The capital is Kingstown.

Geography

The country is made up of more than 30 islands. Saint Vincent is the largest island. To the south the small Grenadine Islands stretch toward the country of Grenada.

Saint Vincent is mountainous. The highest point is an active volcano called Mount Soufrière. The Grenadines have coral reefs. The country has a warm climate with dry and rainy seasons.

Plants and Animals

Rain forests grow on the mountains of Saint Vincent. Palm and fruit trees grow in lower areas. Mammals include

opossums and large rodents called agoutis.

People

About two thirds of the population is black. Many other people have a mixture of African and European or Carib Indian ancestors. There are small groups of Asians and whites. English is the main language. Most people are Christians. Most of the population lives in towns along the coast of Saint Vincent.

Economy

The country's economy depends on tourism, banking, and agriculture. Crops include bananas, coconuts, and root vegetables.

History

The Ciboney, Arawak, and Carib Indians were the first people on the islands. In the 1600s shipwrecked African slaves landed on Saint Vincent and mixed with the Carib. The British won control of the islands in the 1700s. British settlers brought in more Africans to work as slaves on sugarcane plantations. Saint Vincent and the Grenadines became an independent country in 1979.

Salamander

A salamander is an amphibian with a slender body and a long tail. They are related to frogs and toads. Salamanders look rather like lizards. But unlike lizards, they are covered with smooth, shiny skin. There are about 400 species, or kinds, of salamander. They include newts and mud puppies.

Salamanders live mainly in the northern half of the world. Like other amphibians, they can live either in water or on land. Salamanders especially like dark, wet places, like the woods.

Most salamanders are about 4 to 6 inches (10 to 15 centimeters) long. They have four short legs. They are usually brightly colored, often with spots or stripes. Salamanders can breathe through lungs or through special organs called gills. Some salamanders can take in oxygen through their skin.

Salamanders usually hide during the day and come out at night. They eat insects, small fish, worms, snails, and smaller salamanders. Salamanders have several ways to protect themselves from enemies. Most kinds can release a poison that tastes bad or causes pain. A salamander can also lash its tail to defend itself. If the tail breaks off, a salamander can grow a new one.

Salamanders hatch from eggs. Most salamanders begin life in water in a form called larvae. Larvae go through a series of changes, called metamorphosis,

A salamander often has bright colors or patterns on its body.

to become adults. Salamanders that hatch on land come out as miniature adults.

Salem Witch Trials

In 1692 many people in Salem, Massachusetts, came to believe that there were witches among them. As fear gripped

the town, they put their fellow townspeople on trial for witchcraft. The Salem witch trials caused 19 people to be put to death.

In 1692 Massachusetts was one of Great Britain's North American colonies. It had been settled by strict Christians called Puritans. The witchcraft scare probably began when a slave named Tituba told a group of girls stories about African witchcraft. A few of the girls then claimed to be possessed by the devil. They accused Tituba and two other women of witchcraft. Colonial officials believed the girls and arrested the women. Tituba confessed to being a witch.

The town panicked. Between May and September townspeople accused hundreds of men and women of witchcraft. The colony set up a special court to try

An illustration shows a trial of two women accused of witchcraft in Salem, Massachusetts, in 1692.

them. Under pressure, many of the people on trial falsely accused others. About 150 people were put in prison. Nineteen people were found guilty and hanged.

By October the panic was over. The governor of Massachusetts stopped the trials and released the prisoners. The government later reversed the guilty decisions.

Salk, Jonas

Jonas Salk was a pioneer in the field of medical research. His research focused on creating vaccines, or substances that protect people from diseases. He is best known for making the first safe and successful vaccine to prevent polio.

Polio is a disease caused by a tiny germ called a virus. The virus can damage the nerves in the spine. Some people with this damage lose their ability to walk. U.S. president Franklin D. Roosevelt had polio. He used a wheelchair for the rest of his life. Others lose their ability to breathe on their own, which can cause death.

Jonas Edward Salk was born in New York City on October 28, 1914. His parents were immigrants from Russia.

Dr. Jonas Salk vaccinates a girl against polio in 1953.

After graduating from high school at only 15 years old, Salk entered the City College of New York. He went on to medical school at New York University and became a doctor in 1939.

Salk began studying vaccines in 1942. By the 1950s he had developed a vaccine against polio. He tested the polio vaccine on large numbers of people, including himself and his own family. The vaccine worked. In 1955 the U.S. government agreed that Salk's vaccine was safe. Millions of children soon received the vaccine. Salk's success made him a hero. He received the Presidential Medal of Freedom and other awards.

Salk died in La Jolla, California, on June 23, 1995. Today polio has been nearly wiped out in the United States and

many other countries. However, it still occurs in places where children have not received the vaccine.

Salmon

Salmon make difficult journeys, including leaping up waterfalls, to reach the place where they mate and produce offspring.

Salmon are fish that are known for making long, difficult journeys in order to breed. Salmon belong to the scientific family Salmonidae, which also includes trout.

There is one species, or type, of Atlantic salmon. There are six species of Pacific salmon: coho, chum, king, pink, sock-eye, and cherry.

Where Salmon Live

The Atlantic salmon lives mainly in the North Atlantic Ocean. It breeds in the

rivers of North America and Europe. Pacific salmon are found in the waters of the North Pacific. They breed in rivers near both the North American and Asian coasts.

Physical Features

Salmon come in a range of sizes. The Atlantic salmon weighs about 12 pounds (5.5 kilograms). The pink salmon usually weighs 3 to 6 pounds (1.4 to 2.7 kilograms). The king salmon may weigh 25 pounds (11 kilograms) or more.

While in the ocean, salmon have a silver color and spots on their back and fins. During the breeding season, they undergo changes in color that vary by species.

Life Cycle

After being born in freshwater, salmon travel to the ocean. They live there for one to three years. Then they travel back to where they hatched in order to breed. For some salmon, this can mean a trip of more than 2,000 miles (3,200 kilometers). Salmon may leap over waterfalls and cut through churning rapids to reach their home waters again.

Once in freshwater, salmon stop eating and live off their body fat. The males fight for a mate. After a male and a female are paired, the female digs a pit and lays thousands of eggs. Most Pacific salmon die shortly after mating. Many Atlantic salmon, however, return to the sea and may breed again.

Salt Lake City

Population
(2000 census),
city, 181,743;
(2007 estimate)
180,651

Salt Lake City is the capital of the U.S. state of Utah. It is the world headquarters of the Church of Jesus Christ of Latter-day Saints, or the Mormons. The church strongly influences the city's political, social, and economic life.

Salt Lake City lies in a valley at the foot of the Wasatch Range of the Rocky Mountains. Several ski areas are located nearby. Salt Lake City hosted the 2002 Winter Olympics.

Many people in Salt Lake City work for the government or in health care, trade, tourism, or other service industries. Factories in the city make computers, software, and other high-technology products.

Mormon pioneers founded Salt Lake City. In 1847 a church leader named Brigham Young led a group of Mormons westward from Illinois. They were looking for a place where they would be free to practice their religion. They settled in a valley near the Great Salt Lake. The Mormons turned the bare land into a beautiful, well-planned city.

In 1856 Salt Lake City became the capital of the Utah Territory. Utah became a U.S. state in 1896. Salt Lake City was the state capital.

Samoa

Samoa is a small island country in the southern Pacific Ocean. Samoa's capital and largest town is Apia, on the northern coast of Upolu Island.

Samoa is in Polynesia, which is part of the region called Oceania. There are two main islands, Upolu and Savai'i, and seven smaller islands. Six islands east of Samoa are controlled by the United States. They are called American Samoa.

The islands of Samoa are rocky and mountainous. They are surrounded by coral reefs. The weather is hot and humid all year.

Rain forests cover much of Samoa. The wildlife includes bats, lizards, snakes, scorpions, centipedes, and many birds.

Polynesians make up almost all of the country's people. These people and their language are called Samoan. Many people also speak English. Christianity is the main religion.

A village in Samoa has both traditional and modern buildings.

Tourism, fishing, and farming are important parts of Samoa's economy. Farmers grow coconuts, bananas, pineapples, mangoes, and taro.

Polynesians settled in Samoa in about 1000 BC. Europeans first arrived in the 1700s. In 1899 the United States and Germany divided the islands between themselves. The United States took the eastern islands (now American Samoa). Germany took the western islands, which were called Western Samoa.

New Zealand ruled Western Samoa from 1920 to 1961. The country became independent on January 1, 1962, and changed its name to Samoa in 1997.

Samurai

For hundreds of years warriors called samurai controlled Japan. The Japanese emperor took away the power of the samurai in 1871. But even after that, many Japanese people continued to honor the samurai for their fighting spirit.

Rise of the Samurai

The first samurai protected vast lands owned by members of Japan's upper class. Gradually the samurai spread out across the country and got their own pieces of land. They also built up their own armies. The samurai became more and more powerful.

In 1185 one of the samurai gained military control of all Japan. In 1192 this person took the title of shogun. The samurai then became the ruling class of

A photograph from the 1860s shows a samurai in armor.

Japan. Shoguns ruled Japan until 1867. Japan also had emperors during this time, but the emperors had less power than the shoguns.

Bushido

The samurai followed a set of rules called Bushido. The word Bushido means “way of the warrior.” A samurai built up his body and learned all the skills of a soldier. He was brave and honest. He honored his parents. But above all, he obeyed his leader. A samurai who lost a battle, or whose leader was killed, would often kill himself because he felt he had not done his duty.

End of the Samurai

Japan was mostly at peace between the 1600s and the 1800s. During this period most samurai worked for the government instead of fighting. But they were still called samurai because the rank was handed down from father to son.

By the mid-1860s many samurai were unhappy with the conditions in the country. They thought that the country needed to be more modern so they took part in a revolution that brought down the shogun.

An emperor named Meiji took power during the revolution. The samurai wanted Meiji to make Japan stronger. He did, but he also took away the power of the samurai. He created a modern army to replace them.

Yemen

Sand

Sand is made up of small, loose pieces of rock, soil, minerals, and even gemstones. It may also contain the remains of living things. Sand particles, called grains, are smaller than gravel. They are larger than particles of mud or clay.

Sand grains can be described by their size, color, and shape as well as the way they feel to the touch. Some grains are hard, while others are softer. Some are jagged or rough. Others are smooth and polished. Sand particles may be flat, oval, or round in shape.

How Sand Forms

Nature forms sand constantly. Tiny chips of rock are always breaking off from boulders, cliffs, and mountainsides. As the weather and water wear down the chips, they create sand. This is the most common kind of sand.

A second type of sand comes from living things, such as corals and clams. After

Building sand castles is a popular beach activity.

the animal dies, the ocean slowly wears down its skeleton or shell into tiny particles. This type of sand is common on tropical beaches.

A third type of sand comes from minerals dissolved in water. When the water dries up, it leaves behind the minerals in the form of sandlike crystals.

Where Sand Is Found

Sand is found in many places all over the world. It collects at beaches and in lakes and rivers. It lies at the bottom of oceans. In some deserts and on some beaches, the wind blows sand into large hills called dunes. Sometimes sand gathers at the openings of deep canyons. Schools and parks often provide sandboxes for children to play in.

Because sand grains are so small and light, they travel more easily than most other kinds of rock. Wind, water, and ice can carry sand far away from the place where it first formed.

Sand Dune

A hill or ridge of sand piled up by the wind is called a sand dune. Dunes may form wherever there is a lot of loose sand and enough wind to move it. Beaches and deserts are common places for dunes.

Most windblown sand is made up of the mineral quartz. However, near volcanoes, dunes may be built of volcanic ash particles. In some very dry regions, particles of the mineral gypsum can form gypsum dunes.

Dunes are always changing. The wind shifts the sand into a variety of shapes and heights. As wind containing sand comes to the peak of a dune's slope, the speed of the wind drops. The wind then releases the sand it was holding. The sand falls down the dune's steeper side. As this action keeps happening, the dune moves in the direction that the wind blows.

San José

Population
(2006
estimate), city,
344,750;
(2003
estimate), urban
area,
1,085,000

San José is the capital of Costa Rica, a country in Central America. It is the largest city in Costa Rica by far.

The economy of San José is very important to Costa Rica. Many people in the city work in government or business offices, schools, hospitals, hotels, and shops. Factories in San José make food and tobacco products, cloth, chemicals, software, and electronics.

American Indians have lived in the San José region for many thousands of years. In the 1500s Spain took control of what is now Costa Rica. Spanish settlers founded a town called Villa

San Marino

San Marino is one of the smallest countries in the world. It is surrounded by the country of Italy. Its capital is also called San Marino.

Geography

San Marino lies in the Apennine Mountains in central Italy. Mount Titano rises in the center of the country. Hills cover the southwest. A grassy plain slopes down in the northeast. San Marino has cold winters and warm summers.

Plants and Animals

Olive, pine, oak, ash, and other trees grow in San Marino. The country's animals include moles, hedgehogs, foxes, badgers, weasels, and hares.

People

The people of San Marino are similar in culture and background to their Italian neighbors. Italian is the main language. Most of the people are Roman Catholics.

Mount Titano is the highest point in San Marino. It is 2,424 feet (739 meters) tall.

Economy

Banking and tourism are very important to San Marino's economy. More than 3 million people visit San Marino each year. San Marino also sells postage stamps to collectors.

History

Stories say that a Christian named Marinus founded San Marino in the early AD 300s. He and his followers wanted freedom to practice the Christian religion. The people of San Marino built mountain forts that protected the country against invaders. This allowed San Marino to remain independent.

A group of representatives called the Great and General Council governs San Marino today. San Marino does not belong to the European Union (EU), but it uses the EU's form of money, the euro.

San Salvador

Population
(2007 census),
city, 316,090;
urban area,
1,433,000

San Salvador is the capital of El Salvador, a country in Central America. It is the largest city in El Salvador by far. Over the years it has suffered many natural disasters, including earthquakes, floods, and hurricanes.

San Salvador is El Salvador's center of manufacturing, transportation, and services such as banking and trade. However, in the late 20th century a civil war in El Salvador hurt the city's economy greatly.

Shops line a street in San Salvador, the capital of El Salvador.

A Spanish explorer founded San Salvador in 1525. Spain ruled El Salvador as a colony from the early 1500s until 1823. El Salvador then joined the United Provinces of Central America. This was a union of former Spanish colonies. For a few years San Salvador was the capital of the United Provinces. In 1839 El Salvador became an independent country with San Salvador as its capital.

From 1979 to 1992 San Salvador was the site of terrible violence. The government of El Salvador fought rebels and had many thousands of other citizens killed. After the war the city worked to recover.

Santa Claus

Santa Claus is a legendary figure who is said to bring Christmas gifts to children. In Great Britain he is also known as Father Christmas. According to the story, Santa Claus lives at the North Pole with his wife, Mrs. Claus, and many elves. Throughout the year Santa and his elves make toys for Christmas. But they also keep track of which children have been good and which have been bad. On Christmas Eve Santa delivers toys to each good child's house.

Santa Claus is based on Saint Nicholas. Nicholas was a real person who lived in the AD 300s. People loved him because of his many acts of kindness. Through stories, Nicholas became known as a gift giver. In some European countries chil-

The first pictures of Santa Claus in his familiar red suit were drawn by Thomas Nast in the 1800s.

Children received gifts on his feast day, which was in December. Other countries had similar traditions of children receiving presents around Christmas. Europeans brought these traditions with them when they settled the American Colonies. The Dutch in particular are said to have brought the story of Saint Nicholas. The name Santa Claus came from the Dutch word for Saint Nicholas, Sinterklaas.

The image of Santa that people know today developed in the 1800s. In 1822 Clement C. Moore wrote a poem called *A Visit from Saint Nicholas*. This poem is better known as *'Twas the Night Before Christmas*. It describes a chubby, jolly, rosy-cheeked old man with a white beard. He flies through the air in his sleigh pulled by eight reindeer. He climbs down chimneys and leaves gifts

for children. In 1863 a U.S. cartoonist named Thomas Nast began drawing pictures of Santa Claus based on Moore's poem. Nast gave Santa his red suit with white fur trim.

Santa Fe

Population

(2000 census),
city, 62,203;
(2007 estimate)
73,199

Santa Fe is the capital of the U.S. state of New Mexico. The city lies at the foot of the Sangre de Cristo Mountains. It is one of the oldest cities in North America. It is also a major center of the arts and of Hispanic and Native American culture.

The Santa Fe Museum of Fine Arts is an example of a traditional building style in New Mexico.

Tourism and other service industries are important to Santa Fe's economy. Many people in the city work for the government.

The Spanish founded Santa Fe in 1610 as the capital of their colony of New Mexico. Native Americans drove the Spanish out in 1680, but the Spanish returned in 1692.

The city became part of the newly independent country of Mexico in 1821. In that year a trade route called the Santa Fe Trail was opened between Santa Fe and Independence, Missouri.

In 1848, after the Mexican War, New Mexico became part of the United States. Santa Fe became the capital of the Territory of New Mexico in 1851.

In 1912 New Mexico became a U.S. state with Santa Fe as its capital.

Santa Fe Trail

In the 1800s the Santa Fe Trail was one of the longest and most important trade routes in the United States. Like the Oregon Trail (another famous route), the Santa Fe Trail began in Independence, Missouri. It stretched for about 900 miles (1,450 kilometers) across the Western plains to Santa Fe, New Mexico.

From Independence, the Santa Fe Trail went west into Kansas. It followed the Kansas River and then the Arkansas

The Santa Fe Trail divided in two in western Kansas. The southern route, called the Cimarron Cutoff, was shorter but more dangerous.

River into the western part of the state. There it divided into two main routes. The longer route looped slightly northwest into Colorado before coming down into Santa Fe. The other route came directly southwest. It was more popular because it was shorter. But it was also more dangerous because it passed through desert lands that had little water.

People traveled along the trail in covered wagons. Many wagons traveled together in lines, called wagon trains, for safety. If Native Americans attacked, the wagons could form a circle, and the travelers could defend themselves from the center. It took about six to eight weeks to make the trip.

Native Americans had used parts of the trail for hundreds of years. In 1821 and 1822 a trader named William Becknell led the first trading journeys on the trail. For 60 years afterward traders used the trail to ship goods to Santa Fe. People in the West sent silver and furs back to the East. Many settlers also used the trail to move to New Mexico, Colorado, and other parts of the West. In 1880 a rail-

road reached Santa Fe, and people stopped using the trail.

Santiago

Population
(2007
estimate), urban
area,
5,700,000

Santiago is the capital of Chile, a country in South America. It is Chile's largest metropolitan area. It is also the country's center of culture, business, and industry. Santiago lies on the Mapocho River at the foot of the Andes Mountains. The river was made into a canal through the city. The city has had many earthquakes.

Santiago, Chile, sits west of the Andes Mountains.

Many of Chile's factories are in Santiago and its suburbs. The factories make metal products, processed foods, cloth, clothing, leather goods, and chemicals. Santiago is Chile's banking center. Other service industries such as tourism and insurance also bring money to the city.

Picunche Indians lived in the Santiago area before the Spanish arrived. Spanish settlers took over the area in the 1500s. The Spanish conqueror Pedro de Valdivia founded Santiago in 1541. The city grew slowly. Spain ruled Santiago until the early 1800s.

In 1818 Chile became an independent country with Santiago as its capital. After that the city's population and economy grew greatly.

São Paulo

Population

(2007 estimate), city, 10,238,500; urban area, 19,226,426

São Paulo is the largest city in Brazil, a country in South America. The city and its suburbs together make up one of the largest metropolitan areas in the world. The city's name means "Saint Paul" in Portuguese.

Many banks and large businesses have their headquarters in the São Paulo area. Trade, communications, and other service industries also bring money to the city. São Paulo has long been a major manufacturing center. Factories in the metropolitan area make clothing, cars, computers, chemicals, electrical products, and processed foods.

Roman Catholic priests from Portugal established São Paulo in 1554. They lived there with Indians whom they converted to Christianity. In the 1600s the Portuguese used the town as a base for their travels in search of treasure and of Indians to capture and enslave.

It was in São Paulo that Brazil declared itself free from Portuguese rule in 1822. The city grew throughout the 1800s. In the 1900s many new cloth mills and other factories were built. The new industries drew many more people to

the city. By 2000 São Paulo was the largest metropolitan area in the southern half of the world.

Did You Know?

One of São Tomé's most impressive old buildings is the fort of São Sebastião. It houses a national museum.

São Tomé and Príncipe

São Tomé and Príncipe is a small island country off the west coast of Africa. São Tomé is the capital and largest city.

São Tomé and Príncipe lies on the equator in the Gulf of Guinea, a part of the Atlantic Ocean. The country's closest neighbors are Gabon and Equatorial Guinea, on the coast of Africa.

The country includes two main islands: São Tomé and Príncipe. Both islands have lowlands in the northeast and high mountains in the south and west.

Rain forests cover nearly half of the land. Many rare birds and reptiles, including sea turtles, live in the country.

The islands' population is a mixture of peoples descended from three main groups: Portuguese settlers, Africans brought to the islands to work as slaves, and workers from Angola, Cape Verde, and Mozambique. Portuguese is the

Buildings from colonial times still stand in the capital of São Tomé and Príncipe.

national language. Most people are Roman Catholics.

São Tomé and Príncipe's economy depends on agriculture and fishing. Cocoa is the most important farm product. Other crops include coconuts, coffee, cinnamon, bananas, and vegetables. The country also produces palm oil, clothing, and wood. In the early 21st century São Tomé and Príncipe hoped to start making money from petroleum (oil) that was discovered in the Gulf of Guinea.

No one lived on the islands until Portuguese settlers arrived in the late 1400s. The Portuguese soon claimed the islands as a colony. São Tomé and Príncipe gained independence from Portugal in 1975. The country held its first free elections in 1991.
